A. They are founded, yes, sir, upon assumptions which are more or less arbitrary—I hardly like to apply that term to them, as they are arbitraries founded upon well known facts incident to rail-

roading. Yet there is in many cases and in most cases, a certain element of uncertainty and to that extent the application of these various factors is an arbitrary matter.

Q. I believe you stated this morning that while the accounting officers of railroads, are in fact, of industrial concerns—par-
3612 ticularly in railroads—devised methods which they used in separating and apportioning accounts, they had to be based ultimately and finally upon the characteristics incident to the different kinds of service represented by those accounts:

That is substantially what you stated this morning, I think?

A. Yes, sir; that any arbitrary basis of division or any basis of division which is not based upon an investigation of the facts in the case is valueless.

Q. How do the accounting officials of railroads get the information as to the cost in the handling of traffic and the trains on their lines?

A. It is sometimes the division between the various operating accounts, of which I indicated there are 108 as made by a clerk in the Auditor of Disbursements office.

Q. In what?

A. The clerk in the Auditor — Disbursements office. A man who is practiced in those matters and understands the division that is made at headquarters.

In other roads it is paid for each division by a division accountant and the results of his division, as sent in, between the various operating accounts, are merely summarized in the main office.

It depends upon which way the accounting forces of the road is made up, in the division account or a general ac-
3613 count.

Q. In a general way, that is the manner in which accounts are made up in the offices?

A. Yes, sir.

Q. What I want to ask you is this: where do the accountants who make these entries get the information upon which they base their various entires and their various divisions of expenses?

A. They usually know the detail itself. It is a detail matter. They usually know the detail itself.

Q. In making your division of yard expenses between state and interstate, do you use the same total tonnage as you do in the division of "station expenses"?

Mr. HILL: Are you referring to those in these exhibits?

Mr. MOORE: No, in his statement as to his method.

A. No, sir; in my method I would prefer, and would always if I had the time, make an analysis of the tonnage handled at my stations, which would be principally carload lots for labor—for what they call "Station labor" and then divide the expenses of the agents and their clerks upon an accredited basis which would include the car lots. But if I had not that, I would then use the same tonnage for my division of my "Station expenses" as I would my "Switching expenses" if I did not go into that detail.

Q. Does that include the total figured tonnage?
A. Yes, sir, it includes the total tonnage.

3614 Redirect examination.

By Mr. HILL:

Q. Mr. Hillman, as I understood your position about the division between freight and passenger, you did not approve of the division which had been made by the railroad companies in this case, and wanted to get one based on the weights; is that correct?
A. Yes, sir.
Q. Now, I want to ask you this: Suppose you could not get and did not have the data to get the weights of the passenger trains and the passengers carried, and you had the — of shifting the cars around from here to there, and you had to go back to the records two or three years, which would be an impossibility: what unit would you then adopt as the nearest approximation?
A. If I was debarred from that, I would be compelled to fall back on the train miles as an indicative factor, not an actual.
Q. The next best to the truth you could get at?
A. Yes, sir; if I was unable to get other items, I would be compelled to take that.
Q. Mr. Hillman, I believe you stated that you thought it was proper, in dividing the expenses of "Maintenance of way" also to take into consideration the weight:

3615 I will ask you if that is a factor that enters very deeply into that account, and I ask you what is the usual division of "Maintenance of way" between wear and weather?

A. The usual division of the "Maintenance of way and Structure" account, as between wear and weather is: "ballast"—10% wear; 90% weather.
Q. I believe that is what Mr. Parker, the engineer of the Texas Commission testified they had been using.
In view of that fact does this question of weight cut deeply into the division of expenses of "Maintenance of way"?
A. Not deply; but it would cut some.
Q. I believe it would only affect the 10% that is usually accepted as the amount attributable to wear?
A. Well, it would affect all those accounts, of which the one that I have mentioned, the ballast, is only a representative account. There are a number of others in there, such as ties and rails——
Q. It would affect the others, whatever the proportion was?
A. Yes, the difference between the weight proportion and the train mile proportion.
Q. If you were not able to obtain the data to ascertain the weight, what would be the basis that you would use for "Maintenance of way and structures"?

3616 A. If I were not able to obtain the train weights, I would then take for that portion my train miles and obtain the percentage which exists in the train miles.
I would then take my car miles and obtain that percentage.

I would add the two together and divide by two and use that.

I would do that because it would come closer to the train weight basis than would the train mile basis, and that would be the basis which I would be seeking.

Q. I believe that is what is done here—put the car mile on the train mile.

Mr. Hillman, you testified to some question that Mr. Moore asked you that I did not quite catch. I got mixed up on which subdivision you were referring to about passenger trains. I believe it was the division of "Mail and express." You and me had some discussion about that and in looking for the place I failed to catch it: Would you mind repeating what the substance of that was?

I think it is (B) on page 2 of the "passenger." I am not quite certain, but I will ask you to look at it and see.

A. There were two thoughts that came up with reference to that matter and I will ask you if you refer to the one concerning whether it was proper to charge the repairs on mail and express cars, and coaches, on the basis of the mileage by these different cars, regardless of the fact as to whether a repair on a coach might not
3617 be more per year or for a given time, than the repair of a package car. Was that the one?

Q. Yes, I did not catch Mr. Moore's question or your answer to it.

A. He asked if I considered—that is it is my recollection that he asked if I considered that a fair division in view of the fact that there might be a difference in the use of these cars.

My answer was that the proper division would be to determine the amount of repairs necessary to keep mail cars, per unit, in order; express cars, per unit, in order; and coaches, per unit, in order, and on that basis to correct, if necessary, the mileages of the respective coaches, mail cars and express cars, and use that unit.

Q. Now, Mr. Hillman, I want to read you one of the Iron Mountain Exhibits, which is statement No. 5 of Exhibit No. 3:

"The bases used in dividing operating expenses taxes and other fixed charges between states and between the freight and passenger business."

That is the heading.

"Maintenance of Equipment:

This account includes all cost of repairs, renewals and depreciation of cars and locomotives, also shop machinery and tools. The cost of repairs, renewals, and depreciation of equipment being of a general nature and not applicable to any particular state is divided between all states upon the basis of the mileage of each class of service in each state.

The cost of repairs to shop machinery and tools, stationery and printing, and supervision, is divided between states upon the
3618 basis of the total engine mileage over the territory under the jurisdiction of each shop superintendent.

The cost of repairs to freight and passenger cars *are* compiled separately and all expenses of a common nature *is* divided between freight and passenger upon the basis of the number of train miles in each class of service."

That gives you the explanation of the way the railroad company has handled the freight account of equipment.

I will ask you, in view of that, what you say as to the correctness of the average car mile basis being used here?

A. If the passenger car mileage—the repairs of passenger cars is taken on the total passenger car mileage for each state, regardless of the class of passenger cars, the division shown upon page 2 of this Exhibit M, is correct.

Q. Now, Mr. Hillman, I understood from the questions put to you, that the plaintiffs were criticising this division of "Traffic expenses" apportioning a part of the same to mail and express on the revenue basis: You seemed to have had quite a discussion with Mr. Moore on that subject:

I want to call your attention to Exhibit No. 3 in this case, filed by the Iron Mountain in which 21% of passenger expenses is charged to the "miscellaneous" on the basis of the revenue. That "Miscellaneous" of course you understand includes the mail and express, and the expenses divided includes "Traffic expenses";

Do you think the railroads having made that charge that
3619 way, that the state is subject to criticism for making some charges against the traffic there, or against mail and express—or the traffic expenses, I mean?

A. I would consider that a very fair precedent at least, for adopting the same method.

Q. Mr. Hillman, I believe you heretofore expressed the opinion that it is not really proper to get at the absolute truth of it, to divide the traffic on the revenue basis, but in the absence of any better basis, you have been driven to accept it: is that about your position on that subject?

A. On the "Traffic expenses" yes, sir.

Q. And that is what the railroads have done in this case and I presume, in the cases which you have been interested in?

A. Yes, sir.

Recross-examination.

By Mr. MOORE:

Q. Will you explain what you mean by the statement that in dividing the freight and passenger expense, you would take the "train miles" and the "car miles"?

A. I meant by that, that in default of having my train wait for a factor—not being able to determine that factor, I should take my train mileage, switching included, and establish the percentage which existed between freight and passenger.

3620 I should then take my passenger car miles and my freight car miles and establish the percentage which exists between those two.

I should then add these two percentages together and divide them by two and use that factor as approximating more nearly to the train weights than I could find in any other way.

Q. If you could get, though, the cars, have the weight of the

contents and passengers of cars, and the number of passengers you would use the train weight as your factor?

A. I would use the train weight.

Mr. MOORE: That is all.

Mr. HILL: That is all.

3621 Cross-examination of Mr. T. A. HAMILTON.

By Mr. MOORE:

Q. I believe you worked for the Missouri-Pacific Railroad Co. from 1893 to 1900, the last time, did you not?

A. Those are the dates roughly, yes, sir.

Q. You have already stated the capacities in which you have worked, and now, what salary did you receive during this period?

A. I think the maximum salary that the Missouri-Pacific Ry. ever paid me was $50 a month; I would like to say in that connection, that I left the service of the Company because they had promised to pay me more, and after I had, as I thought, made good on the proposition, they didn't keep their promise, and I left the road for that reason.

Q. You went in 1900 to the Illinois Central?

A. Yes, sir.

Q. Engaged in billing freight?

A. Yes, sir.

Q. What salary did you get there?

A. The first month, as I recall it, $50. a month; I went on up to a salary of $70. in a month or two.

3622 Q. What was your position during the time you worked for the Louisville & Nashville, during 1901?

A. They paid me first $70., and then $75., and as chief billing clerk, $95.

In the office of the General Agent at St. Louis, my salary was $90. on the payroll, and the general agent, out of his expense account—that is a state secret, but it is a fact nevertheless—brought it up to $110.

Q. When you returned to the Iron Mountain in 1903——

A. I was temporarily loaned to them.

Q. But you returned to the Iron Mountain in 1903, you say?

A. Yes, sir, that is what I refer to.

Q. Weren't you with the Iron Mountain or Missouri Pacific two or three years after that date?

A. No, sir, I spent two months with them at Bixby.

Q. I will withdraw that question then; I was under the wrong impression; what salary were you getting when you were working for them at Bixby?

A. The superintendent allowed me $85., Mr. Peyinghaus had promised me a salary which the L. & N. had paid me, and the first month he was in charge of that station, I was paid that extra ten dollars; I never knew where it came from, and the second month I got it in the same way, although Mr. Kell was agent.

Q. After that, you continued with the L. & N. until you went to Haskins & Sells, and you stated what your salary was?

3623 A. Yes, sir.

Q. You made exhibit the division of expenses shown in statement 4 to exhibit 3, the basis of your work in preparing Exhibit I, did you not?

A. Not in preparing Exhibit I.

Q. In the work you did, what did the state's accountants do, or did they accept that division as shown by the railroad company?

A. The expenses shown in statement 4 of Exhibit 3 for the Iron Mountain and State of Arkansas, were verified by us to this extent, we had recourse to the company's expense distribution books, on which the department, at that time under Mr. Johnson's charge, distributed the various vouchers and expense reports, the superintendent's expense reports throughout the various accounts. In dividing these expenses between freight and passenger, or rather in checking and taking off the company's division of them from that record, we necessarily verified the total as set forth by Mr. Johnson; we didn't go back of his record; that is, we didn't go to the individual vouchers or to the superintendent's reports, except in a few minor instances, and I saw no objection to that as a basis, for the reason that it is made the basis of all the company's statistics.

Q. And you regard it as a correct and proper basis?

3624 A. Yes, sir, we applied some broad tests to it also, to see whether this period averaged up with charges of like character on other periods; on track maintenance, for instance, we took the average cost per mile for several years back, and saw that they averaged up, and that this was fairly normal.

Q. You found though, no objection to that as a proper basis, or as to the manner in which it had been worked up, as far as your verification went?

A. We have no doubt as to the accuracy of these figures; I don't think there is anything wrong with them.

Q. What was your views as to the revenue train mile as a basis for dividing common expenses between freight and passenger traffic?

A. My opinion on that subject, of course, must be based on just what thought I have been able to give it, and what I have heard people say; I have had nothing to do with the operation of trains in an executive capacity. If you want that, I would be glad to give it to you.

Q. Yes, I would like to have that.

A. I should think it was a very fair basis, basing my opinion on what I have just stated, that the extra weight of the freight train would be off-set by the extra speed of the passenger train, and that might make it a fair division.

Q. If that was a proper division between freight and passenger, why did you depart from it in dividing the expense of

3625 operating local and through trains?

A. It seems to me that where you are considering the freight train as one unit, and the passenger train as another unit,

usual divisions between the two classes of service, and you have lumped all your freight trains, that that might be some justification in itself for the first division; that is, you have light local freights and heavy through trains, and they might average up with passenger trains, but when you come to the division between two freight trains, you have a common unit there, both hauling freight cars, and the number of car miles would be the better division.

Q. In your formulas prepared by you and filed by Mr. Wharton in this case, you have disregarded the contents of the cars, haven't you.

A. I would like to take a little exception to that; you say formulas prepared by me and filed by Mr. Wharton; the formulas were prepared by Mr. Wharton and filed by him; I simply consulted with him and did the field work and gathered the figures upon which the formulas were made.

Q. Tell me just what connection you had with the exhibits filed by Mr. Wharton, I would like to know, as accurately as you can state it?

A. We discussed some of the points he referred to in his testimony, and I gave him the benefit of what knowledge and information I had on the subject, from my knowledge and experience; aside from that, my connection was in preparing the figures,
3626 doing the mathematical work, making the calculations, after the data was gathered.

Q. Under whose direction was the method and division adopted in the exhibits filed by Mr. Wharton, prepared?

A. Mr. Wharton, I think, prepared the formula largely himself; we consulted somewhat about it, he asked my opinion on certain points, but the formula was largely his.

Q. Those methods of division were not made at your suggestion, and were not your creation, you might say?

A. No, sir; we read the testimony of witnesses in this case, and we read the testimony of witnesses in other cases, and we have discussed it somewhat, and after those discussions, Mr. Wharton arrived at this formula; these bases.

Q. What I want to know is, who it was that conceived the idea of using this method, whether you or Mr. Wharton, or some other person?

A. It was got at in that way, but in the last analysis, Mr. Wharton prepared the formula you see in these exhibits.

Q. To go back to the question I asked you a moment ago, in making your divisions on the car mile basis, did you take into consideration the weight of the contents of the cars?

A. No, sir, a car mile was a car mile with us.

3627 Q. You have treated an empty car in the same manner you did a loaded car?

A. Yes, sir.

I would like to go back to the question you asked me awhile ago; in questioning me as to what compensation I received from the Missouri-Pacific Railroad; I was employed the major portion of my time under the direct supervision of Mr. W. Q. Morcom, who was

then chief clerk of freight accounts, a position which nowadays on the Missouri-Pacific carries the title of Auditor of Freight Receipts.

I would like to state that Mr. Morcom often regretted that Mr. Schuyler, the general auditor, would not allow him to pay me any more salary, and in fact, he moved me temporarily out of his department and the line of my service, in an endeavor to get me more salary; I never had any fault found with my work; I relieved a man whose salary was the maximum in the department, I recall, for several months in succession; I checked the accounts of Kansas City, Atchison and St. Joe stations, filling the position of the highest salaried man in the department, outside of Mr. Morcom himself, and I finally left because they wouldn't pay me any more.

Q. Are the employees of Haskins & Sells graded with reference to salary and importance of their work?

A. I don't know what guides our firm in fixing salaries; I don't know first hand, but it seems to me, the basis is, the man's
3628 ability to earn a salary, and the character of work he can do.

Q. What I asked you was, if their employees were graded, first, second and third grade, and their salaries fixed on that basis?

A. We have classes, Class A, Class B and Class C, and the men in Class A get more than the men in Class B, and the men in Class B get more than those in Class C.

Q. Class A are paid higher than class B men?

A. Yes, sir, I should judge so.

Q. What class are you in?

A. I am class B man at present.

Q. You referred in your testimony in chief, to a statement prepared by you or in which you assisted in the preparation, in September 1906, I think it was, on the C. B. & Q. road; was that statement similar to Exhibit 26 filed by Mr. Johnson and Mr. Roth?

A. Yes, sir, I think it is pretty near an exact copy, as far as form is concerned; of course, the figures are different.

Q. How long were you engaged in that?

A. Four months and a half.

Q. You did similar work on the Missouri Pacific?

A. I did part of the time.

Q. How long were you engaged in that?

A. About a month, I think, until I went on to take charge of the Chicago work.

Q. You stated that you have assisted in the audits and
3629 conducted some audits of manufacturing, business concerns, and so on?

A. Yes, sir.

Q. What do you find to be the annual earnings of concerns engaged in that class of business, as a rule? I mean, just stated in a general way, about what the average net earnings are?

A. I wouldn't undertake to answer that without having the figures before me; they fluctuate too much, some extremely high and some extremely low; I have some in mind that pay as high as 44% and some that do not pay but 3 or 4, much bigger concerns.

Q. I believe you stated you had verified the methods used by Mr. Roth in preparing Exhibit 26; that was prepared at the request of Mr. Wharton, wasn't it?

A. I can't say as to that.

Q. Were you not present when the request was made in the Judge's chambers at Little Rock?

A. No, sir, I understood from Mr. Roth or Mr. Johnson that it was so made.

Q. You are familiar with the method used in preparing that exhibit?

A. Yes, sir, I think so; Mr. Roth gave me a memorandum of it.

Q. You have already explained in considerable detail and some length, the manner in which you proceeded to make that exhibit I, and I shall not take you over that ground, because I think
3630 you covered it sufficiently, but I would like you to state how long you were engaged in that work?

A. I began in July, 1909, and I had some of my force working on that up until the end of the year, say in December sometime; I thought I had a memorandum here of the date, but I see that I have not; we found it necessary to go over the figures later on, and finally turned the statement over to Mr. Johnson, as I recall it, in February.

Q. The 14th of February, I understand; did you turn it over to him at the time you completed it, had it ready for use?

A. It was never completed until it was turned over to him; I did some work on it a day or two before he got it; it was practically completed in December some time.

Q. It was not completed until after the 14th of March, you gave Mr. Johnson some sketch or an outline of it; I understood at that time, it was not ready for you to give him the real sheets and details?

A. I may be mistaken as to the dates; I know we had the statements in practically complete form; there was some revision and some checking of it; we checked the whole recapitulation over after that time; it was practically in complete form, either in late December or January, but it was not turned over to Mr. Johnson until possibly March—I thought it was February.

3631 Q. That statement covered about 11% of the total business down in that month, didn't it?

A. Expressed in what terms, Mr. Moore?

Q. You worked up only local trains?

A. Yes, sir.

Q. When I say the total business, I mean of the business on local and through trains?

A. Do you mean ton miles or do you mean trains?

A. You can answer it any way you see fit.

A. I would have to look at it to see.

Q. I will say first, ton miles, I think you made the statement while you were on the stand the other day.

A. Expressed in ton miles, it was 11.18% of the total business.

Q. What part of that really was the most tedious and consumed the most time?

A. Locating the way bills for the car.

Q. And why was that so?

A. I think the explanation of the process we had to go through, which I gave in my direct-examination, is perhaps the best answer to your question; it was a very tedious process.

Q. You used the time cards, train dispatchers' records, wheel reports, and waybills, just speaking from my memory.

A. Yes, sir, and some records from the auditor's office.

Q. The ultimate record was the waybill?

3632 A. Yes, sir, those were my instructions to my force.

Q. And it was the waybill that gave you trouble in locating, and took up the time?

A. Yes, sir.

Q. You turned your work sheets over to the accounting department of the railroad? so that they might verify your work?

A. I turned them over to Mr. Johnson, yes, sir, in a conference between myself, Mr. Clardy and Mr. Wharton and Mr. Johnson.

Q. In looking over your work sheet, I see you prepared a form, pencilled with certain headings, and among them is the heading for reference to the waybill?

A. Yes, sir.

Q. And I find also that on most of the forms, I have examined, and I am told that is the case on practically all of them, that the reference is usually left blank?

A. Yes, sir.

Q. And there is no means of information for verifying your work by tracing of the waybills, was furnished by those work sheets? Is that correct?

A. Yes, sir, I recall the form very distinctly; this is apparently one of the first sheets that was set up, I see it is numbered 11, and I see from its heading, it covers the first portion of the line we tackled, the main line, and we set up this form, not knowing where our investigation was going to lead us; it was a new proposi-

3633 tion, with the intention, if we found it necessary, to set in the waybill number; I can recall a great many sheets where we have noted the waybill number, simply for our convenience; where it was not convenient to go from our record we were working on to the waybill, the waybill was shown on the sheet; simply as a matter of convenience, to aid us, it was often put down.

As I see it, your question comes to the proposition of leaving no information by which the waybills could be located and referred to, thereby leaving anybody who followed us, to go through the same steps we did?

Q. Yes, sir.

A. That is true; we did not put the information on there because I had four men at my disposal for the matter; I don't doubt we would have been working on the statement perhaps yet, if we had done that; not only this statement, but every other statement I compiled, I took pains at every step to inform Mr. Johnson of what we were about to do, and we would have been glad at any time to have his men work with us; in fact, we would have saved the state

some money; there was no desire to hold up these folks and make them do unnecessary work—we were just trying to shorten ours.

Q. Wouldn't it have been an easy matter to insert the waybill reference in the blank space prepared?

A. It would have taken a great deal of time.

Q. I can't see that; of course, you had to have that infor-
3634 mation as a basis of your work, and having the information and having the space ruled off for it here, why could it have produced any delay of any consequence to insert?

A. I think I can make that a little more clear to you; for instance, two men worked together, one with the scale record in front of him locating the cars on these trains; another man with the waybill book, one calling him the number of waybills he found on the scale report, the information as to the train, and the second man calling the weight of the car, and the classification, a much quicker process than noting down the waybill number, and afterwards going through the waybill books, just to refute any charge of unfairness.

I will say that our sole object was to save time, not to prevent anybody from checking the statement; in addition to that, I would like to say too, that in a great many cases, where the waybill book was not readily accessible, reference to those sheets will show that we have noted the waybill number on there, as our own future guide; we did that in order to save time.

Q. I notice here statements of weight of interstate freight? Were not those statements taken from the waybills?

A. Yes, sir.

Q. Would it have consumed any more time to insert opposite that the number of the waybill?

A. I thought I had covered that; we worked a great deal in
3635 pairs or teams; for instance, Mr. Wright would take the scale report, find the cars in that scale record that we wanted on the trains, when the waybill was issued, from and where; I had the waybills scattered all around me; being familiar with them, I could keep track of them; and he called the waybill number; I opened up the book; he called the weight and it was put on that sheet.

Q. The waybill number was known at the time; how much more time would it have taken to insert the number of it in these exhibits?

A. Not a great deal; I can give you no other reason except to save time.

Q. Would there have been any material loss of time; you had that information, the number of waybill at the same time you had the weight shown by that waybill; you called out the number and inserted the weight, and although it required a fewer number of figures to insert the number of the waybill instead of the weight, did it involve a loss of time?

A. My judgment was, when I was doing the work, that it did.

Q. With both those facts before you, as a common sense proposition, with all the information called out to a man who was making the figures, and who put down figures of weight which involved a larger number of figures, and with a blank space for them, would it require any considerable loss of time?

3636 A. No, sir, it would not require a larger number of figures than the waybill; you would have to write in the station series covering the waybill number, and perhaps its date, and if it were a foreign line waybill, you would have to write, in some cases, the name of the road that made the waybill.

Q. I see right here before me in the space under the head of waybill reference, a few references on this sheet; I see under that head 3926 F. S. W.; that is the kind of writing that was necessary to identify that waybill?

A. No, sir, "3926 F. S. W." means that it was received by the Iron Mountain at Ft. Smith from the Ft. Smith Western; that is the number of the Ft. Smith station, and we had to go to another record for it.

Q. Even these references in this sheet are misleading?

A. Those sheets were not intended as exhibits.

Q. They were your work sheets?

A. If in the Missouri-Pacific General Auditor's Office, there is a man who cannot look at that sheet and tell what that means, I wouldn't think much of his intelligence.

Q. Well, we will assume that is an exact reference; I was not criticising that; assuming that does give the waybill number, tell me how much time it consumed in giving those figures there?

A. As to how much time it took, I couldn't say; it wouldn't take but a very small time to write the figures you had on there; we only made a reference of that kind in guiding us, where we had
3637 to; you will find no unnecessary references there.

Q. You say sometimes it took you two or three hours to locate a waybill?

A. Sometimes it did, but I can readily say that our plan was no harder to follow than that the railroad has employed in this case.

Q. Your failure to make a record of the waybill reference, if the railroad should undertake to check those figures, would involve upon those engaged in it, the necessity of going through the same labor you did, and tracing it?

A. Yes, sir, inasmuch as they did not see fit to make a joint matter of it, in the first instance.

Q. Isn't it a fact that in the data worked up by the accounting officials of the railroad, and delivered to the representative of Haskins & Sells, they gave you tracing references so you could verify their work without going to as much labor and trouble and expense as the railroad would be put to on account of the absence of those waybill identifications?

A. I don't know that I follow you; I will say this, that Mr. Johnson has shown us every courtesy and every facility, but we have had to dig out a lot of stuff for ourselves.

Q. Did Mr. Johnson give you the figures based on some record without the references? Didn't he, as a rule, give you the reference to that record so you could turn to it? And you didn't do
3638 that, you did not reciprocate in preparing these work sheets?

A. Yes, sir, but Mr. Johnson has given us no statement of the magnitude of that one.

I gave you an incomplete answer awhile ago; you asked me whether it was not a fact that it took three or four hours to locate a waybill for a car; it did for a few, for perhaps some hundreds of them, but the great bulk of them were not that hard to locate.

Q. You used the wheel reports for what purpose and to what extent?

A. First, as I explained, when working on the dispatcher's sheet, if it showed a local train in operation where a through was scheduled to run, and didn't show on his sheets positively that that local train was annulled or cancelled, we had reference to the wheel reports for that section of road for that day, to see if he had not himself classified a local train as a through train, and as I explained in my direct examination, having satisfied ourselves that he had misclassified it as a through, we took that particular train as a local for that day; that was the first use we made of the wheel report; it gave us the character of the trains' work, and we classified them in that way.

The next use we made of it, was to get from it the numbers and initials of the full carloads, the point at which each car was picked up and set out by the train, and I mention it because it appears
3639 on our sheets, the ultimate destination of the car, as shown by the wheel reports, although it wasn't worth much.

Q. Why wasn't it?

A. Because it was wrong in a great many instances.

Q. That grew out of the want of method and accuracy on the part of the conductor?

A. Yes, sir.

Q. To what extent can those wheel reports be relied upon as correct records of information written in them by the conductor?

A. As to the number of cars he pulled, as to where he picked them up and set them out; if that information is incorrect, the railroad knows nothing about what is going on on the road, and we assumed it was correct, and I treated it as correct.

Q. In other words, the identification and journey of the car?

A. Yes, sir.

Q. You regarded it as substantially correct as to that?

A. Yes, sir.

Q. In other respect, how is it?

A. The conductor shows sometimes net weights, which may be correct and may be incorrect, depending on whether he estimated them, whether they were the billed weight, or whether they were the net weight obtained on track scales.

He shows the gross weights, car and load, which I should
3640 say are seldom, if ever, accurate; they would be accurate in the case where he had the scaling of the car on the waybill, because that would be an actual scale weight of the car and load, but in the case where the car had not been scaled, in the first place, the contents of the car would be shown on the waybill at an estimated weight; in the second place, to get the gross tons, he would have to add an estimated tare weight; I say he would have to; the tare weight is available on the side of the car, but as a matter of fact, the conductor estimates the weight of the car.

Q. Why does he do that, when the tare weight is printed on the side of the car; isn't that for the information of conductors?

A. Yes, sir, and weighmasters, but my experience is that they take them up and weigh them on the desk in the yard office; and there is also a schedule on the back of the wheel reports of estimated weights for empty cars, to be used by conductors when they have cars not stenciled, or hauled without waybills, or miscellaneous information, it says here. My recollection is when I mixed with train men,—I was around the yards with them very often,—practically all of the time when a car had not been scaled, they estimated the tare weight, and filled up the estimated gross tonnage in that way?

Q. That is kind of guessing it off?

A. Yes, sir.

3641 Q. Are they as a rule, careless or particular or careful men?

A. They are as a rule careful, but they are not clerks—they are trainmen.

Q. I mean of clerical habits?

A. As far as estimating car numbers is concerned, there is a check on that, and there is not much chance for it to be wrong; take a train leaving a terminal—I have officiated as yard clerk many a night and Sunday when I was chief bill clerk of the station the conductor goes out and checks the lists the cars that have been made up ready for him to take out on the road, the yard clerk accompanies him, takes the seal protection on the cars; they come into the office, the conductor takes his train book and calls on the yard clerk for the waybills by car number; those waybills are dealt out to him, and as he takes the waybill and enters the contents of the car and destination in his train book, he checks the car numbers to see that he gets the waybill for the cars he has in the train; incidentally, the yard clerk who has taken the seal protection for the cars, gives the conductor that information for the side of the train he took, so that he may have a complete record of the cars he takes out of the terminal, contents and destination as shown by the waybill, and its seal protection; when he gets through

3642 checking up the train with the yard clerk, when he gets the seals on the cars, and has located the waybills for the cars as he lists them in his book, he has a pretty correct record of what he has on the train.

Q. If I remember correctly, you stated on your examination in chief, that it frequently occurred the agent would have duties to perform on the platform which would interfere with his work in the preparation of way bills; I wish you would repeat your statement; you know what I am calling your attention to?

A. That had reference entirely to less than carload business; the agent would have two or three packages of freight to be taken from his station in the local train, and he would make the waybill before the train arrived at the station, take the impression copy of it, have it ready to hand to the conductor, that he might take the waybill and check freight into the car from it; in order to do that, he must make a copy of that waybill without the car number, because he

cannot know in advance of the arrival of the train, into what car the freight will be put, and I said, for that reason a great many waybills covering the L. C. L. freight, would be without car numbers, so far as the auditor's impression copy was concerned.

Q. In other words, that affects the value of the waybill as a record of the car numbers?

A. Of less than carload freight only.

3643 Q. I mean in L. C. L., the kind you are speaking of; is it a fact that practically the agent and the conductor go through the process you described awhile ago, of the one reading off the waybill and the numbers and so on, to the other one, and the numbers of the cars—the correctness of the numbers of the cars as shown by the wheel reports, being protected in that way?

A. Yes, sir, it seems to me that is a protection of it.

Q. The point I asked you, you stated awhile ago, as the principal reason why the description of the car numbers contained in the wheel report was more reliable than other contents of it, that the agent would read off perhaps some number, I don't remember what it was, and the conductor would take it and enter it, and in that way, it came in there by a mutual process between the two? That is what, I refer to now; I want to ask you if practically that is absolutely carried out, or if in the practical manner of conducting their work, the agent does not simply hand the conductor the papers he has, and the conductor takes it and later on works it out.

A. I can only speak from my own experience in a yard office, and I will amplify that process a little for you; as a matter of fact, the conductor takes his train as I described; he lists the numbers of the cars from the cars themselves in the train that is made up for him to take out on the road, and then he comes into the yard office, and asks for waybills to cover those cars; he is not allowed to transport them without some form of waybill, the regular

3644 waybill or card waybill, which temporarily takes the place of the waybill; he comes in and asks the yard clerk for the waybill for the first car in his train. The yard clerk files those waybills in little pigeon holes, according to the terminal number of the cars; the yard clerk takes the waybill; reads the car number, and hands the waybill to the conductor, tells him the contents and destination; the conductor takes that; the process is repeated until the train is covered.

I speak not only from observation on that, but from actual experience in handing out those bills, which was part of my duty in the Bixby yard that I spoke of, on the Iron Mountain; it was often my duty in the yard in East St. Louis, when I relieved the yard force during the press of business and lack of help; as a matter of fact, the conductor checks his train over with the yard clerk to see that he has the waybills for all his cars.

Q. You think, as far as the numbers are concerned, and the place of the car picked up and the place where it is dropped off, the wheel reports are fairly reliable?

A. Yes, sir.

Q. Do I understand that in other respects you do not regard them as reliable records?

A. Not in the question of tonnage; you understand that the figures shown by the conductor may be the actual ones on the way-bills he has in his possession, but they are afterwards subject to weighing and revision, and to the actual tonnage being inserted, and of that, the conductor knows nothing.

3645 Q. Their habits, business and work is not such as to qualify them for doing work of that sort, is it?

A. They are not clerks but trainmen, but I see no reason why the statement of cars they carry and where they carry them to and from, should not be accurate.

Q. I am asking if in other respects from these three, if you regard those wheel reports as reliable records?

A. No, sir.

Q. Speaking about one feature of that record, you referred to, you said that the record shows where the car was picked up, and where it was dropped; tell me now just what you mean by that, take a station like Little Rock, where are the cars that are brought into Little Rock, destined to Little Rock, where are they dropped off the train?

A. My recollection is they would be dropped at Argenta on the main line.

Q. What would the wheel reports show about that?

A. It might show they were left at station #829, 830 or 831.

Q. What are those stations?

A. Those are the stations in the Little Rock terminals. 829 is Argenta, 830 is Baring Cross, and 831 is Little Rock Union Depot; some of the conductors call the Little Rock terminals by that number, although it is a passenger station now.

3646 It might be shown as set out at Little Rock 3998, which is the number on the Ft. Smith branch, or they might have been shown, if they came up the Valley Division, to have been delivered at station 4000, which is East Little Rock, depending on where they were coming from and what direction.

Q. In other words, what they try to show is, they try to designate the place at which they were left?

A. Yes, sir. I might say in that connection, that while sometimes, take Little Rock for example, the conductor will show the cars left at 830 or 831 or 829, apparently three different stations; if his train went into Argenta, the heading of his wheel report is pretty correct, and that shows that he came into Argenta and took those cars into Argenta yard, since he showed those cars were left in Little Rock terminals.

Q. In other words, the information you think would be fairly reliable there as to the place of the yard he left it in; if he left it on the north side of the river, he wouldn't regard it as being left on the south side of the river, would he?

A. If his train broke up at Argenta, it certainly did not take the car any further; if it broke up at East Little Rock, it did not take it any further.

Q. What does the record show, the wheel report?

A. In case of conflict between the information given in the body of the report as to where the individual car was left at
3647 Little Rock terminals, and that information given in the heading as to where the train's journey ended, we do not attempt ot run the car any further than the train; if the wheel report showed the car stopped at Argenta, and the conductor said that he took the car to Little Rock, we figure it stopped at Argenta or Baring Cross; we consider Baring Cross and Argenta all one yard.

Q. In checking over the wheel reports, I wish you would state from your memory, where those reports showed most of the cars destined to Little Rock, we will say from the north, were left, whether at station 829, 830 or 831.

A. I would have to have the sheets here to tell you, I don't recall now; I do recall that the conductors mixed those numbers at times.

Q. Then you took the train book——

A. We endeavored to get, as far as we could ascertain, the actual mileage made by the car.

Q. Why is it that you do not include in your abstract, the description of the L. C. L. carloads; I think you stated in your examination in chief, that you included the number and initial of all full carloads, but you did not of the L. C. L.

A. As I explained before, we knew that it was impossible to locate all the waybills for L. C. L. package freight, and made no attempt to locate any of it; we saved time by not setting up the cars separately; we afterwards applied the average loading as estab-
3648 lished by the Cotton Belt test; the individual car meant nothing to us.

Q. What are the records in the office of the auditor made up from, in regard *of* handling of freight?

A. The auditor's record of freight handled is made necessarily from the waybill, whatever records he makes of its handling; his revenue records are made from the waybill.

Q. They are the basis, I suppose, of the auditor's accounts?

A. Yes, sir.

Q. Do those waybills show the tonnage?

A. Yes, sir, the waybill would not be a regular waybill without that.

Q. Are the waybills used in the auditor's office as a basis for keeping account of tonnage, the statistical amount of tonnage?

A. My understanding is, and from Mr. Roth's statement in this matter, that primarily the waybill is the basis of tonnage figures.

Q. And does it show the tonnage of trains on which the billing was issued?

A. No, sir, it shows the weight of the individual shipment, covered by the waybill.

Q. Perhaps I asked my question in the wrong way; what I wanted to know was, was there accounts of the tonnage of trains made up from the waybills?

3649 A. My understanding is that is not a matter of compilation by the auditor; my understanding is that the information which is compiled in the office of the car accountant, is compiled from the wheel report; that is, they get the gross ton miles in that way.

Q. And in like manner, you went to the billing frequently I suppose, to get an account of the freight hauled in these local trains?

A. Yes, sir, we went to the billing.

Q. Did you confine yourself to the billing for that month?

A. No, sir, we confined ourselves to the waybills covering the cars that were in the trains; some were September waybills.

Q. The waybill doesn't show the train the freight goes on, does it? The auditor's copy of the billing doesn't, does it?

A. No, sir.

Q. You deem it necessary, in order to get the weight of the contents of the cars, to go beyond the wheel report and to trace it up,—somewhere I believe you said you did, and explained how you did it in your examination in chief?

A. Yes, sir.

Q. Of course, in doing that, whatever you did was confined to local trains?

A. Yes, sir.

Q. You didn't take up the through trains?

A. No, sir.

3650 Q. And you wouldn't have any information as to the tonnage that was carried on through trains from the scaling of them?

A. No, sir, we compiled no information for the through trains.

Q. The local trains, the trains that run as a rule within the limits of the state,—through trains as a general rule, I think, come from outside of the state?

A. Not necessarily.

Q. Not necessarily, but I am speaking of the general rule, that is the general case, isn't it?

A. The Iron Mountain has local trains on its Memphis branch, that run over into Tennessee.

Q. Yes, sir, they treat that as a local train?

A. Yes, sir; on its main line, running north from Hoxie, into Missouri,—Poplar Bluff.

Q. Give me the terminal points?

A. Hoxie and Poplar Bluff, as I recall; it may run to Piedmont; out of Van Buren, local trains run up to Wagoner; from McGehee, one runs south into Louisiana to Monroe, and from McGehee south into Louisiana to Lake Providence; when you get down close to the border divisions, locals pay no attention to the state line.

Q. Those, you say, are treated as local trains, and were they treated as local trains by you?

A. Yes, sir, necessarily so, because they were local trains for the mileage which they travelled in Arkansas.

3651 Q. You described in your examination in chief, the process of getting the scale weights?

A. Yes, sir.

Q. What you said about that, is confined to local trains?

A. Yes, sir, and to their performance in the state of Arkansas, when they cross the state line.

Q. Suppose that freight was brought into Arkansas on a through train, interstate freight operating into Arkansas on a through train; in such a case as that, would those cars be scaled at the first place where there was a scale, after it started out from the initial point of the trip?

A. That, I think, is the usual practice.

Q. That, in all probability, would be some point in the State of Missouri?

A. Yes, sir, it may have been in Missouri or Kansas.

Q. Freight that is brought in on a through train as distinguished from a local train, you did not trace back for the purpose of getting the scale weight?

A. Not unless it got on a local train in Arkansas, when we became interested in them and ran them down.

Q. What effect did that have on the correctness of your weights as to trans-state freight and interstate freight that happened to go into the state on a through train, instead of a local train, and which was scaled in Missouri?

A. If they moved on a local train inside of the state, we got them.

3652 Q. Suppose it did not do that; suppose they moved on a local train inside of the state, but they were not sealed inside of the state and came into the state on a through train, how would you get at the correct weight?

A. It would not make any difference to us where they were scaled as long as they were scaled.

Q. You went to the scaling for the purpose of verifying the weights on the wheel reports?

A. No, sir.

Q. For the purpose of getting the correct weights?

A. Yes, sir, and to locate the billing that covered the cars.

Q. You said you traced those scalings in one direction or the other direction, but that was all on local trains?

A. Yes, sir.

Q. May there not have been a case, in which goods handled on local trains, were brought into the state on through trains, and for which you were not doing any tracing?

A. Yes, sir, I see your point now; I guess you misunderstood my explanation; it did not make a bit of difference to us where that car came into the state, where it was going, or anything about it, until it got into a local train; how it reached that local and became a part of it, was of little interest to us. The fact that it was scaled before it reached the local, or that it came to the local in a through train, had nothing to do with it; if it was scaled, it was re-

3653 ported to the auditor regardless of the service it got before it got to the local train, and that was all we were interested in.

Q. You didn't trace it and get to any record, for the purpose of tracing it up the line of the direction of the through train as you described yesterday?

A. I did not intend to say that, if I did; what I mean was, if we did not find it weighed at the first track scale that the local hauled it over, we went back to the next track scale in the direction which the car was coming; we did not know whether it passed that other scale in a through train or local train.

Q. Suppose it did not pass a track scale or was not scaled in the state of Arkansas on a local track.

A. It might have been scaled in Kansas, Missouri, Nebraska or Colorado.

Q. What I am trying to ascertain was, what you did in that case of that class of freight, trans-state and interstate, which was hauled in on through trains?

A. Assume we had a car moving in a local train from Hoxie to Newport on the main line, and we did not find that car was weighed on the scales at Hoxie; it was going south; the supposition was, in most cases, it was moving steadily in one direction; we tried Poplar Bluff scale, the next scale north; if we didn't find it there, we proceeded on up; I haven't the exact scale locations here now; let's assume there was none between Poplar Bluff and De Soto, we
3654 tried De Soto, and then we tried the St. Louis scale, and in that way, we, in most cases, located our car.

Q. You don't mean there was a local through from Hoxie to De Soto or St. Louis, do you?

A. No, sir, but if the car came over Iron Mountain rails from St. Louis to Hoxie, it certainly had a chance to be weighed at any scale between St. Louis and Hoxie.

Q. You mean, to that extent, you investigated the records of through trains?

A. No, sir, I didn't care what kind of train it was in; I investigated the scale records, looked at the records of scales it moved over.

Q. Going to the matter you mentioned a moment ago, in order to ascertain the tonnage of the L. C. L. cars, you say you got the total figure and multiplied it by 4?

A. The total car mileage figure, multiplied by 4.

Q. In order to get the ton miles?

A. Yes, sir.

Q. And you say you based that on the exhibits 19 and 20, filed by the Cotton Belt railroad in this case?

A. Yes, sir.

Mr. HILL: He said he deduced that from the statistics there found.

Mr. MOORE: I said he took that as the basis because exhibits 19 and 20 showed that.

3655 A. I said, we figured from the basic figures given in Mr. Kimbell's exhibits and that result was obtained; that figure appears nowhere in his exhibits.

Q. I understand that is what you say here; it was the result of calculations based on that exhibit?

A. Yes, sir.

Q. That is what I understood all the time; I don't understand that you took it bodily out of the exhibits. Do you think that it is fair and right, and that you could properly apply a condition of that kind on the Cotton Belt road, where the average haul is 40 miles, to the Iron Mountain Railroad, where the average haul is 72 miles?

A. I don't see the connection.

Q. It seems to me there is a good deal of connection.

A. I think I said in my examination in chief, that I was of the opinion—it is a matter of opinion pure and simple—that the average loading would be heavier on the Iron Mountain, owing to a greater density of traffic; aside from that, I did not express any opinion.

Q. Yet you applied the rule, based on calculations in the Cotton Belt exhibit, to the Iron Mountain, notwithstanding, in your opinion, it would not have been proper to do it.

A. I didn't say that.

Q. You said it was your opinion there would be a heavier tonnage and yet you apply that rule to it?

3656 A. I gave you my opinion on the subject; we used the figure four as a result of a consultation between Mr. Wharton and myself, and when we finally decided on its use, we thought that we were stating for the Iron Mountain the minimum, in making use of the figure so arrived at; we put all the ton miles state L. C. L. shown in Mr. Roth's exhibit, on the local train. Now, any increase of that figure 4 will simply result in putting more interstate L. C. L. ton miles on the local train; any reduction of it, would take some off.

Q. That is all very true; we will assume that is all true; the point I want to call your attention to, is whether that is a correct basis upon which to ascertain the loading of those cars in ton miles?

A. The only way in which the actual figures can be obtained is to ride the trains, as was done in the case of the Cotton Belt.

Q. Mr. Ludlam testified in the Missouri rate cases, didn't he, that an estimated figure such as you have stated you made in the C. B. & Q. case, was of very little value, that the only way reliable information could be obtained, upon which a statement could be based.—a correct statement could be based, was to do it at the time, and as you say to ride the trains, didn't Mr. Ludlam state that?

Mr. HILL: We want to object to that; Mr. Moore has ob-
3657 jected time and again to stating testimony in other cases.

The MASTER: The record shows what Mr. Ludlam testified.

Mr. MOORE: I am calling attention to Mr. Ludlam's testimony in the Missouri case; he is the head of Haskins & Sells, and if the testimony of Mr. J. M. Johnson, taken down in Arkansas in another case is competent, this certainly would be.

Q. Didn't he make that statement?

Mr. HILL: I object to the question; Mr. Johnson's testimony that

I sought to introduce over your objection, was proved to be correct in a measure and in a measure incorrect, by the others; that is all I am asking; you are trying to prove what Mr. Ludlam testified; there is a record to prove that.

By the MASTER: I do not think that is a correct question.

3658 Q. Mr. Hamilton, you know what Exhibit 14-a and Exhibit 15 in the Missouri Pacific Case was, do you not?

A. I do not believe I am familiar with them by number.

Q. It is the total tonnage of state and interstate freight, W. C. Fisher's exhibit.

A. I would like to say that I was not present at a great many of the Missouri hearings. I was up in Chicago at that time.

Q. Well, never mind that.

Mr. Ludlam testified on the stand in this case that those were the exhibits showing the state and interstate freight on the Missouri Pacific Railroad, and he also testified that his information was that that data upon which those exhibits were based was obtained by men who went along with the trains.

He further stated that he testified in that case that it was not practicable to get that information accurately as to what makes up the tonnage of particular trains, whether they be local trains or through trains.

Then he testified that he stated further in that case that it was impracticable to ascertain that information from the books and records of the Company subsequent to the operation of the trains and the handling of them:

If he is correct in those statements, is the information obtained by you in the manner you described, as distinguished from the method adopted by Mr. Kimbell, the results which have been ob-
3659 tained in exhibits 19 and 20, correct and reliable data upon which to act?

A. I would say in answer to that, Mr. Moore, that while I did not hear Mr. Ludlam's testimony and am not familiar with the exhibits you refer to, that what Mr. Ludlam had in mind—at least it appeals to me that what he had in mind was the classification of less than carload business.

It is inconceivable how anybody understanding the method in which freight is handled under way-bills and what becomes of those way-bills after the freight is handled, and what a detail record of handling of the freight they must necessarily be, that anyone knowing that, and undoubtedly Mr. Ludlam did, would say that information of this character as to carload business could not be ascertained at any time during the life of the way-bill under which the car moved. The location of the way-bills for less than carload business is open to the objection that I have made to it in my testimoney here.

Q. Now, going back to the Cotton Belt statistics upon a calculation from which you based your four tons to the less than carload car:

It is in evidence in this case that the cotton hauled to compress

points was less than carload business and was treated as interstate business: that is correct is it not?

A. I understand that it is in evidence in this case that cotton hauled to compress points was treated as interstate
3660 business.

Q. And that it was principally less than carload traffic? Did not Mr. Bee so state?

A. I don't recall that he stated that.

Mr. HILL: If you want to read him any testimony, read it, but do not ask him——

Mr. MOORE:

Q. I want to ask you if, in view of the large cotton movement in the month of October, it would be fair to take the Cotton Belt statistics, or calculations based upon the Cotton Belt statistics for movements of freight in that month, as a test for the average loading of less than carload cars for a period of six months.

A. To pass an opinion on that I would first have to know operating conditions and first hand on the Cotton Belt and to know the relative volume of other commodities moving in the various months. I would not like to pass upon that without such information.

Q. You did pass an opinion on it when you used the figures of the October test as a basis to be applied to the six months' period. That is the very thing you did and that is what I am asking you now.

A. I think I explained fully, Mr. Moore, how that was arrived at. That is comparing the two months, the same month in each year on the two roads. I said that in my opinion it was a fair proposition to apply a figure of four to the Iron Mountain because of the greater density on the Iron Mountain——

3661 Q. I am not speaking of applying Cotton Belt statistics to the Iron Mountain, but to the Cotton Belt itself, and the point I want to call your attention to is this:

If, on account of the very large movement of cotton in October, if that would not operate unfairly as between—to apply a deduction made from those figures and the test of Oct. 1907 to a period of six months.

A. I misunderstood your former question. I did not mean to——

Q. Well, now I have made myself plain, what do you say?

A. I will say that in doing that we read Mr. Kimbell's opinion as given in evidence here, that October, as far as the relative volume of state and interstate business was concerned, was a normal month. That is, while the total volume of state and interstate might fluctuate from month to month, the relative movement would be the same. At least, I so construed it, and when he said "interstate," of course he had in mind cotton traffic which is all interstate and that was our reason for applying those figures in that way.

Q. Did you understand Mr. Kimbell as saying, or intending to say, to apply that statement to the loading on less than carload cars?

A. No, sir; to state and interstate business.

3662 Q. We are now talking about the correctness of the principle upon which you have ascertained the average loading of less than carload cars, and you take October, the heaviest cotton month, perhaps, in the year——

Mr. HILL: Is there any evidence of that?

Mr. MOORE: We don't need any evidence on that; we will assume it.

You take the calculations based on those figures: now, I ask you if anything in Mr. Kimbell's testimony was understood by you as justifying that course?

A. I understood it to mean that the relative volume of state and interstate business was the same for one month as for any period—I think he said a period of years, in answer to Judge Hill's question.

He was talking of state and interstate business and the relation between the volume of the two. Now, as both state and interstate move interchangeably, carload and less than carload, in the same cars and in the same trains, I think that applies.

Mr. Kimbell testified on page 91 of Volume 1 of the printed record, and Mr. Doddridge on page 156 of Volume 2 of the printed record—we used the light that these gentlemen gave us, because they were closer to the proposition——

Mr. HILL: Read what Mr. Doddridge says.

A. This is in answer to a question from Judge Hill:

3663 "Q. Mr. Doddridge, I will ask you, from your experience, what would you say was the average loading of the less than carload package freight car?

A. The load of less than carload freight varies greatly——

Q. I am talking about Arkansas?

A. I have no statistics as to Arkansas, but in my judgment, it probably would not run over three or four tons.

Q. What average loading is maintained in such a car, in a day's run, over a local freight train?

A. Well, in a local freight train that is peddling it out; it simply decreases until it is resolved to nothing."

We also had in mind Mr. McPherson's statement as to the average loading of these package freight cars which ran from——

Mr. MOORE:

Q. From two to five.

A. —two to five, I have not looked it up Mr. Moore.

Q. That is my recollecton of it, two to five.

In your quotation from Mr. Doddridge's testimony he states the opinion that the average loading of a less than carload car would not run over three or four tons.

A. I think he says from three to four.

Q. He says exactly what I stated there.

A. Yes, sir; that was my recollection of it.

Q. Now, if that is true, would October not swell the loading above

the average for a year, for a period of six months on account of the movement of cotton that month?

A. It might, yes, sir, but I fail to see how that would
3664 affect our use of that figure materially because we have already loaded on to the local train all of the state less than carload business shown in Mr. Roth's exhibit, put all the state business on which is developed to be the most expensive train. Any change in the total ton mile figure which we put on local trains and from which we deduct the total state to get at the interstate on local trains, would simply affect the interstate figures. If that loading of four tons is too low, then we will have to put some more interstate less than carload in the local train. If it is too high, we will have to put some more of it on the through trains.

Q. You also said in your examination in chief that you thought when you took all the state less than carload ton miles from local trains you worked an injustice to the state business:

You were asked what information you based that on and you stated that it was practical to haul—you gave as a reason for that view it was practical to haul state freight in Arkansas a maximum of 305 miles.

Now, Mr. Hamilton, I want to ask you if it is usual to haul state freight in Arkansas 305 miles?

A. That I cannot say, sir.

Q. Do you not know from your examination of the testimony in this case that a haul of 305 miles on state freight in Arkansas would be exceptional?

A. I stated that was a miximum, Mr. Moore.

3665 Q. Perhaps you did state that. Now, is it fair to take the highest maximum haul that is practicable or possible in the state of Arkansas and base a statement such as you made upon that possibility?

A. I think my statement was that as that haul was practicable that freight moving that distance would move at least a portion of its journey in the through train. That is what I was illustrating. The average haul of all state freight shown by Exhibit 26——

Q. We know what it is—72 miles.

A. Yes. The average haul of all less than carload state freight is shown as a trifle over 57 miles. Of course, that is the average. It takes in all the short haul stuff and all the longer haul stuff and I should say that there is a good deal of long haul stuff in there—perhaps a good deal short of 300 miles, but there are many local freight trains run in Arkansas way below 100 miles, and it would be economical railroading and good railroading, wherever a shipment could traverse a through freight division in a through train to let it travel that way and do its peddling at either end or both ends in a local. I gave as an illustration a shipment from McGehee to Van Buren, 102 miles from McGehee to Little Rock and 150 odd miles further to Van Buren.

3666 While I could conceive that such a shipment might be hauled in the local from McGehee to Pine Bluff, and perhaps again in a local from Pine Bluff to Little Rock, I do not believe

that the agent at Little Rock would allow it to go up the Ft. Smith division in a local.

Take a shipment from Texarkana to Newport, or from Newport to Texarkana; take a northbound shipment; that could have moved in October, 1907, in a local to Arkadelphia. It might move in a second local from Arkadelphia to Little Rock, but I feel pretty sure it would go out of there in a through train.

Take a shipment from El Dorado out on the end of the Camden Branch, as it is called, to say, Pine Bluff—if the Iron Mountain got the shipment—it would move in a local, perhaps, to Gurdon, but while it might go in a local from Gurdon to Little Rock, I think again at the transfer platform in Little Rock it would go in a through train—I do not suppose a great deal of freight moves the maximum of——

Q. I just want to ask you one question about that: I want you to give me your views from your knowledge of the statistics and the records in this case, as to whether such a haul and such movements as you have described are usual or would they be exceptional?

A. Not having analyzed the contents of a less than carload car, I could not answer that question, but it seems to me reasonable that such movements would be made and if they are economi-
3667 cally handled by the railroad, they would be handled in the manner in which I have stated, getting a partial haul in the through train.

Q. I did not ask you if you thought it reasonable that such movements as you gave might occur: I asked you this:

Assuming that such movements might occur and did occur, are they not exceptional?

A. I don't know that it is exceptional. I could not say without analyzing the situation.

Q. Do you think that there is a very large volume of traffic moving between McGehee and Van Buren?

A. I don't know that there is.

Q. I just ask you, speaking of those two stations, if you are able to form a judgment and state whether that would be customary or exceptional?

A. I simply gave those illustrations as those on which I based my opinion.

If you care to have it done, I will be glad to examine the company's way-bills and see if those movements——

Q. I will not ask you to do that.

Your stated in your first examination in this case, referring to the work embodied in the exhibits, that having ascertained the train engine, freight car and caboose miles of the local in each train, you deducted that figure from the total figures of like character in the company's statistics, referring, I suppose, to Exhibit 26?

3668 A. No, sir, that was the ton mile proposition, Exhibit 26. The train mile figures——

Q. I see the distinction, from the statistics compiled by you. Now, those statistics were the total statistics without distinction

between the tonnage carried on local and through trains: that is what you refer to?

A. I think you are confusing two things. Those figures would not have any tonnage in them.

Q. Well, tell me just what you refer to: you say, that having ascertained these elements that I recited a moment ago you deducted them from the totals of figures of like character and the company's statistics. I think that is plain enough. What I want to ask you is this:

If any incorrectness or errors should, by chance have crept into your results and the figures that you made when you attempted to fix the relative quantities—I will call it that for the want of term just now—by the process described, your results were defective and erroneous both ways?

That is to say, your showing of the similar elements on the through train would be affected just as much as the showing on local trains?

A. Necessarily so; to whatever extent that error existed on the through train it would on the other.

Q. In other words, the error would multiply itself in that way?

3669 A. It would be reflected on both sides.

Q. Mr. Hamilton, do you think there is any distinction between the intermediate terminal expenses and the same character of expense at originating and destinating points of freight hauled?

A. Do you mean as applied to the freight or as comparing terminal with terminal?

Q. As applied to the freight.

A. Yes, there would be some, undoubtedly.

Q. What would be the difference, in favor or against?

A. An intermediate terminal, by which I take it you mean a terminal——

Q. What I want to know is, which would involve the greater expense, the terminal or the intermediate——

A. That is what I started to answer, but I want to give my reason first.

Q. Then I want to apply it in another way. I spoke of freight. I will include also the movement of trains handling cars at intermediate terminals and at the termini of the train run.

A. That involves two propositions. When you speak of the handling of freight in a terminal sense it means one thing with less than carload and another thing with carload.

When you speak of handling of trains, it means the handling of cars in the trains.

3670 Q. Take the freight first.

A. The first distinction between the handling of carload and less than carload, the handling of less than carload originating at or terminating at intermediate terminals, would be practically the same as at the destinating or originating terminal. But in that case that I referred to the intermediate terminal would be the origin or destination of the freight.

In the case of freight moving from one small center which would be its originating terminal, to another small point which would be its destinating terminal, through a large intermediate terminal, that freight would undoubtedly get just as much handling at that intermediate terminal as it had at either end, for the reason that it would go into that terminal, possibly, in the way car and be unloaded and reloaded in another way car to go out on the line beyond.

Q. Describe what would be done at intermediate terminals between division points——

A. The handling would be the same at both ends; there would be no material difference.

Q. I want you to compare now the expense at the intermediate terminal with the expense at the originating and destinating points——

A. That was what I was aiming to do.

Q. —in cases where the freight does not pass an important
3671 terminal in going from one place to another, but where it is between important terminals.

A. Where both its originating and destinating points are between the important terminals?

Q. Yes.

A. It would get a handling at both ends, loading at one end and unloading at the other, provided it would not have to be transferred. If the point to which it was destined was not the termini of a local freight run, it would get just those two handlings——

Q. What do you mean by "terminal"? I want to see if we are going at cross purposes. What do you include in the terminal expenses?

A. It depends, in the first place, on what you call a "terminal." In the ordinary acceptance of the term, the terminal——

Q. I mean the sense in which you used it in your exhibit in this case?

A. We used it in a great many senses. If you refer to the particular use I will be glad to define it.

Q. I will call your attention to that part of your testimony that I want explained in connection with the questions I have asked you, which, perhaps, I have not formulated in a happy way to get the information I wanted to get.

You say:

3672 "We took the reports for the entire month of all through and local trains running into and out of a given terminal."

A. Yes, sir.

Q. "Or passing through them": that is what I have in mind now.

"And at the time we found a car set out at an intermediate terminal by a through train we charged that as a terminal handling—whenever we found a car set out by a local—etc."

You are recognizing, as I understand it, two classes of terminal services—terminal services at the intermediate terminals and at the originating and destinating terminals of the train?

A. Yes, sir.

Q. What I want to inquire of you, Mr. Hamilton, is this: which involves the greater expense, the intermediate terminal handling or the terminal handling at the point of origin or destination?

A. Without having before me the expense of operation of each of these terminals where a switch engine was kept, in connection with the number of cars using the terminal, I would not be able to form any comparison. If I knew the expense of a terminal for a given period I could make a comparison.

Q. Do you make any allowance for the difference in the expense of intermediate and other classes of terminals in the formula which you applied in this case?

3673 A. Perhaps, Mr. Moore, if I make a little explanation of my testimony right there, it will be more clear.

Mr. McPherson, or his office, to be more accurate, furnished us with a list of the stations in Arkansas at which switch engines were maintained during October, 1907, the month we had under examination.

Those engines were kept there—aside from their industrial switching—for the purpose of handling cars left there by trains and handling cars to be taken away from those stations by trains.

Now, between Argenta and Texarkana, the termini of a through freight run, I found a switch engine kept at Hope. That engine was there to take care of any cars set out at Hope by a through or a local train, or it prepared for movement any cars to be picked up there by either class of trains, and we have taken a number of cars handled at each terminal as indicative of the use made of that terminal by through and local trains; that is, the number of cars handled for each class of train.

In order to compare the expense of handling those cars, I would first have to know the expense of the Hope terminal, per car, and then set it up against Texarkana or Argenta or these other points to make a comparison.

The engine was there and the cost or expense per car unit of handling would depend upon the use made of the service.

3674 Q. What did you do about it? Did you make any allowance for any increased expense at the termini over the intermediate?

A. I spoke of "intermediate" in the sense that in that case Hope was——

Q. The question is did you make any allowance?

A. No, sir; we took all the cars handled at all the terminals.

Mr. HILL:

Q. You mean terminals where there are switching engines?

A. Yes, sir. We had to do that, necessarily, unless we had separate expenses for each terminal and could pro rate it separately between local and through trains on the basis of the use made of that service at that time.

You will recall, further, that in asking for that information as to the Ft. Smith terminal we were told that it was in the central

division expense accounts and that it was not now obtainable. I think Mr. Johnson made that statement. So we were compelled to lump, not only the expense of terminals but the use made of them to divide that expense.

3675 Q. You spoke this morning about a back-haul in some connection:

If I remember, Mr. Bee testified as to the practice of railroads in carrying freight to division points and then back-hauling. He stated that less than carload freight—we will say from Little Rock on the Iron Mountain—would be carried to Little Rock on a local train and shipped up the line, what he called a "back-haul," thirty or forty miles:

Is that the practice?

A. I don't know, Mr. Moore, as to the Iron Mountain in Arkansas, because we did not go into the less than carload cars to know what their contents were, but there might be occasional for that.

I think that would occur in some cases. I don't know just how the Iron Mountain loads its merchandise and where its transfer platforms are, but I can conceive where that might be done and it might be good railroading to do it.

For instance, St. Louis might have freight for the first, third or fourth stations north of Little Rock, on a given date and not enough to make a full car to break bulk at the most north-

3676 erly station of the three or four; sooner than load that in a car for, say, Newport, to be reworked, they might load it in a Little Rock car to be reworked and come back.

I know the Frisco does that very largely at some of its transfer platforms, at least I am so informed by their superintendent of transportation. But not having gone into the contents of the cars on the Iron Mountain in Arkansas, as I stated, I don't know.

Q. Mr. Bee also stated that that would be done with reference to the carload as well as less than carload?

A. I don't see the necessity of that.

Q. Where would that freight appear in the statements prepared by you, that back-haul?

A. Carload or less than carload?

Q. Either way.

A. The carload would appear in the trains that handled it both ways.

Q. In the train that handled it both ways?

A. Yes, in the trains that handled it in both directions.

Q. Will you please explain that?

A. Say a car was going from Newport to a point north of Little Rock. For some reason that was carried into Little Rock and then carried back. We would have a record of it on each train. I do not recall any of that. I don't think that carload business

3677 would be back-hauled. I don't see the necessity for it.

Q. How would it be on the less than carload?

A. I can't answer that, sir.

Q. Where would it appear in your figures?

A. We would have the car miles of the car that took it in one direction and the car miles of the car that took it in the opposite direction and would multiply that by four, as we did others.

Q. In other words, you would have the cars to Little Rock and on the back-haul from Little Rock to——

A. Yes, any back-haul. If it moved in a local train we would have each.

Q. And that would be multiplied by four?

A. Yes, the average loading.

Whether there was any back haul stuff on the carload business, I don't recall, and I don't know as to the less than carload because we did not analyze the contents of those cars.

Q. But to the extent that there was a back-haul it would appear that way in your accounts?

A. Yes, sir, if there were any, it undoubtedly would.

Q. How would that appear on the record of the Railroad Company?

A. I assume you refer to Mr. Roth's figures?

Q. Yes.

A. Mr. Roth would take into his figures the haul indi-
3678 cated by the heading of the way-bill, as I understand.

Q. That would be from St. Louis to the station north of Little Rock, whatever that station would be?

A. Yes, sir.

Q. We will say Beebe: Mr. Roth's figures were taken into that station?

A. Yes, sir.

I don't believe that in the ordinary conduct of the business of the road a carload of freight would be back-hauled. I don't see the necessity for it. The only excuse would be in the case of a car of perishable stuff or a desire not to stop a car at intermediate stations, and I don't think they make any time by back-hauling——

Q. Now, Mr. Hamilton, were the figures which are the bases of the exhibits filed by Mr. Wharton, compiled with accuracy by you or those who were working under your direction, do you think?

A. The men who assisted in the compilation of them were competent and thoroughly understood their instructions. The plan outlined for their compilation was a good one, in my judgment. To the best of my belief those figures are accurate, yes, sir.

Q. I suppose its value depends upon its correctness?

A. Its value would depend upon the correctness of the percentages which were derived from those figures, because the percent-
ages themselves are what are used in our various calculations.
3679 I am speaking now of the figures on Exhibit "I." And whether those percentages are right or wrong depends upon the correctness of the figures upon which they are based?

A. Necessarily so, except when you are dealing with totals, where large differences are necessary to affect the percentages, which, of course, are expressed in parts of one hundred.

Q. Who are the parties who assisted you in making up those figures?

A. Mr. Wright and Mr. Dutlinger, practically all of the time; Mr. O'Conner, and Mr. Hetzel and Mr. Reichardt, who did simply clerical work, such as copying, additions, and did none of the classifying of the ton mileage.

The gentlemen I have mentioned were employed by the Arkansas Railroad Commission, working under my supervision.

In addition to that, at various times when we could use a man for a few days, we had the assistance of some of the members of Haskins & Sells' staff. Mr. Gilliam, of our St. Louis office; Messrs. Porter and Webster of our Chicago office; Mr. Senft, of our St. Louis office.

The bulk of the work, however, was done by Mr. Wright, Mr. Dutlinger and myself.

Q. Were your figures, at any time, shown to the accountants of the railroad company and was any revision made by you and your men on account of errors that were pointed out?

3680 A. The principal revision which was made in our figures was due to the fact that after we had gotten most of them together, we found that either Mr. Roth had been mistaken or we had misunderstood him as to the basis on which he had figured the mileage in his Exhibit 26.

A great many of the distances which our cars were hauled, were fractional distances. That is, the distance would terminate in a fraction of a mile and we understood that in making his figures Mr. Roth had dropped fractions of ½ mile and under.

It developed later, when our figures were practically completed, that Mr. Roth had picked a half mile up, and over. That necessitated a revision of our figures, our car mile and mileage figures.

We found some minor errors in our figures, principally errors in footing car mileage, in making that revision. Those were the only differences that our attention was called to.

Q. Did you make corrections of all those figures, Mr. Hamilton?

A. Yes, sir, I had the figures gone over by my assistant.

Q. I hand you one of your work sheets and call your attention to what is contained in the column "miles hauled" opposite car number 82,962 P. R. R.

3681 Also car 3972, with the initials of the Cotton Belt, St. L. & S. W., and car 64,413, B. & O.

I wish you would examine that and state what appears upon it in regard to the miles hauled and any corrections that may have been made by you in regard to that; state what the corrections indicated by Mr. Roth were, or by whoever represented the railroad.

A. (After examining paper.) I find that the mileage shown opposite those cars is 41 miles each. Those are the figure- placed on there by one of my assistants.

The information given on the abstract sheet indicates that those three cars were hauled from Station No. 997, which is Harrisburg, Arkansas, to Station 987, which is Paragould, Arkansas.

The mileage between those two points, indicated by the official Station List, is 37.46 miles.

When the mileage of 41 was placed against those three cars, in

the first instance, it was an error of four miles for each car or a total of 12 car miles.

I find that on revising our figures, as I explained a few moments ago—which revision was first necessitated by a misunderstanding between Mr. Roth and ourselves—that we have revised those figures to read "37" miles, which is the exact distance shown by the station list, between the two stations, correcting that original error of four miles per car for the three cars.

3682 I find that opposite our station number "997" on the sheet, somebody has noted station No. "987," indicating that the car was taken there, and showing delivery point at station 786, whereas we have it from Harrisburg to Paragould.

The mileage of 37 miles as latterly placed by us, is correct for the haul which we show.

Whether the cars were actually hauled from Paragould to Knobel, as indicated by this second correction (which was not made) I can only say by reference to the wheel report. If that second correction is correct, the correct mileage would be 21 miles.

Q. Have you the wheel report there?

A. No, sir, the wheel report is part of the Company's permanent record and is in their possession.

Q. Now, Mr. Hamilton, would that four miles difference be accounted for by the fraction you spoke of a while ago?

A. No, sir, the four miles was a revision which we made. We corrected the four mile item at the time we revised our other figures.

Q. You explained a while ago that you had fallen into some errors by reason of a misunderstanding or mistake in the representation made to you by Mr. Roth as to the manner in which he used fractions, which amounted to——

A. It would make a mile each way——

Q. —that was the way you made the errors?

A. No, sir, that was what started us to revising the miles

3683 on these sheets.

Q. That does not explain that difference, does it?

A. I said before, in doing that we found some other differences which we attempted to adjust as we went along.

Q. Do you know if the mileage used by you in making up your ton miles is the same that was used by the Railroad Company in making up Exhibit 26?

A. I understand so, yes, sir. We were informed they took the mileage on the Official Station List of the Company and that is what we aimed to use.

Q. Please explain what figures you used in ascertaining the mileage?

A. We took that out of the Company's Official Station List.

Q. And applied the information you got from the wheel reports?

A. Yes, sir.

Q. You do not know where the Railroad Company obtained the figures, the basis of the ton mileage represented in Exhibit 26?

A. I am informed by Mr. Roth that he used the station list mileage, which is the basis we used. Mr. Roth had given me a

memorandum of the method on which he had compiled Exhibit 26 and the basis used, when our work was about completed.

Prior to that time we had just discussed the matter verbally, which served our purpose as well.

3684 I notice here under the head of "Mileage" he does not state the source from which he got the mileage, but I recall distinctly that he told me it was taken from the Official Station List. I don't see where else he got it from.

Q. Were there a large number of errors corrected by you in the manner you spoke of a while ago, that had been pointed out by the railroad accountants?

A. There were quite a few in the mileage adjusted, yes, sir. Whether you would consider them large in view of the size of the statement would be a matter of opinion, but there were quite a few.

I recall one instance where on comparison of the mileage used by the Transportation Department and that in the Official Station List, we were shown a wire from the Division Superintendent to the effect that the mileage on the White River Division was a mile out of line, I don't know whether it was too much or too short in the station list, but that impressed on my mind the fact that the railroad company did make the station list the basis of its mileage.

Q. Were you able to locate all of the cars?

A. There were some unlocated. I endeavored to have Mr. Dutlinger, who is still assisting me, make an actual count Saturday, but he told me these sheets were in use, and again today—until he gets the sheets I cannot say how many.

3685 It just occurs to me, Mr. Moore, that I left a point uncovered in my last answer:

Reverting back to this car mile revision: I recall that the differences we located were both ways, up and down, and that the net change in our figures was negligible.

Of course, when you consider the revision of a statement of that kind, its accuracy, you must consider all sides of it, because the figures used in our exhibits are the percentages derived from those figures. The mistake which would offset another one, of course, would nullify it.

Q. I hand you one of your work sheets and I want to call your attention to car I. C. 42,282, which is shown to have moved on October 1st, on train 295, from Wynne to Bald Knob:

Will you take the sheet and state what the contents of that car was?

A. (After examining sheet) The sheet does not describe the contents of the car. Was that your question?

Q. Yes, give the pounds and the classification of the freight?

A. It is classified as "trans-state", 56,000 pounds, and I would infer that the final destination shown on the wheel report was Lyndon, Kansas.

Q. Now, take the same car which was hauled on October 2nd, from Baring Cross to Newport?

A. That is not on this sheet. It would be on another

3686 division.

Q. On October 2nd——

A. That appears as the last car in train 92, moving from Baring Cross to Newport. The classification shown is the same. The weight is shown as 44,800 pounds.

Q. There is a difference in the weight, is there not?

A. Yes—that would amount—if the weight shown on the first train of 56,000 pounds were correct—to a shortage in the trans-state weight on the other train of about 150 ton miles.

Q. How would it be the other way if the second was right and the first wrong?

A. That would amount to an excess of the trans-state ton miles on the first mentioned train of about 450 ton miles.

Q. Now, take the same car from Newport to Cushman, on October 3rd?

A. It is a trans-state car moving one day on each local train. I find that the weight of 56,000 pounds shown on the first wheel report which we discussed is shown on that. It is classified also as "trans-state" in each of the three instances.

Q. That is a difference of what?

3687 A. The same difference as existed between the first two cars. It is identically the same weight as shown on the first movement.

Q. Do you know what the correct weight is?

A. I assume, without second reference to the billing, that certainly two weights of one car and one movement cannot be correct. Which is right, I would have to refer to the billing to determine.

Q. I understand neither one is correct; it is 62,000 *thousand* pounds?

A. That would necessitate my examination of the Company's records again.

Q. Now take car C. & O. 6855.

A. Is it a similar movement?

Q. Yes, a similar movement.

A. It is from Bridge Junction to Bald Knob, according to this abstract sheet.

Q. Assume that was from Bridge Junction——

A. My record shows Bridge Junction.

Q. —what is the weight on that car?

A. The weight is shown "trans-state, 76,000 lbs."

Q. Take the next movement made on the 2nd of October: what is that movement?

A. I assume you mean from Bald Knob to Newport?

Q. Yes—Baring Cross.

A. I find that car classified as "trans-state, 42,000 lbs."

3688 Q. That is a difference of 34,000 pounds, is it not?

A. Yes, sir.

Q. That is to the destination of it, I suppose?

A. Yes, sir.

Q. What destination does your record there show?

A. My first record of the car, the conductor has reported it as a

car for Linwood, Kansas. I recall there was a heavy tie movement out there at that time for the Union Pacific Railroad.

The second wheel report from Baring Cross to Newport, the train in which the car was hauled from Bald Knob shows the destination is Kansas City, which is entirely consistent, as the car would route through Kansas City.

Q. Now take C. C. 4143 of the same date, the same train and give the weight of that car on the first movement?

A. From Bridge Junction to Bald Knob, in train 295——

Q. What is the weight and classification?

A. That is classified as "trans-state freight, 63,700 pounds."

Q. Now, take the next movement from Bald Knob to Newport and give the weight and the classification?

A. It is classified as 54,200 pounds of interstate freight.

Q. What is the difference there?

A. 9500 pounds.

Q. There is a difference in the classification, too, is there not?

3689 A. Not as we made use of the figures.

Q. It is classified as "trans-state" in one instance and in the other as "interstate"?

A. You will find no "trans-state" figures on our Exhibit "I" or in our percentages.

Q. You have furnished "trans-state" figures in evidence, have you not? I believe Mr. Wharton did?

A. Yes, sir, at your request.

Q. Take the next movement, now, on *the* October 7th, and see what that is?

A. On the same train? the last I had was on the first, I think.

Q. No. 296.

Q. That is a train moving in the opposite direction, on the White River Division,—no, that is the White River train north of Newport.

Here is a trans-state car that took five days between Newport and Batesville.

We revert there to the original figure shown on the first train, 63,700 pounds.

Q. Now, take car C. M. St. P. 80,800, and turn to train 295, October 1st and state the movement, and the weight and classification there?

A. The car is shown as moving from Bridge Junction to Bald Knob, containing 68,700 pounds of trans-state freight.

Q. What is the next movement—train 92, October 2nd—what is the weight and classification there?

3690 A. It is classified again on that train, as "interstate" business showing a weight of 40,000 pounds.

Q. A difference of 28,700 pounds?

A. Yes, sir.

Q. Now, take N. Y. C. 26,361, on train 295, October 1st: what is the movement there?

A. That moved from Bridge Junction to Bald Knob. The weight is shown as 68,700 pounds of trans-state freight.

Q. The next movement, on train 92, classified as trans-state?
A. 50,600 pounds.
Q. The difference there is 18100 pounds?
A. Yes, sir.
Q. Take C. I. & S. car 182405, in train 295, October 1st, and state where that moved, and the weight and classification of it?
A. It moved from Bridge Junction to Bald Knob and is shown as containing 72,800 pounds of trans-state freight.
Q. Take the next movement, on train 92, October 2nd, from Bald Knob to Newport: what is the weight there?
A. There seems to be a discrepancy there, Mr. Moore. I find this car on train 92 bears a similar number, but instead of being listed as "C. I. & S." it is listed as "C. & E. I." Which of the two is correct, or which wheel report is correct, I don't know without reference to it.

Q. Is it not probably the same car?

3691 A. I would not assume that without seeing the wheel report. We show a weight of 42,600 pounds on it here.

Q. These cars are left together on the same train?
A. Not necessarily. If they did, they are——
Q. Does this not show the moving on successive days on the same train, first from Bridge Junction to Bald Knob and then from Bald Knob to Newport, on the second of October?
A. One train shows a C. I. & S. and the other a C. & E. I. I note that Mr. Wright has marked it on the side "no record." I don't know what is referred to.
Q. What is the weight?
A. The weight in the second train—that is the weight of the car marked C. & E. I. is 42,600 pounds.
Q. That is a difference of 30,200 pounds?
A. If it is intended to cover the same movement as the previous car.
Q. Take I. C. car 35,853; give the movement, the weight and classification on that, on the first day of October?
A. It moved in train 295, from Bridge Junction to Bald Knob and it is classified as "trans-state, 60,300 lbs."
Q. Now, give the movement on October 2nd, in train 92?
A. It is shown as moving from Bald Knob to Newport and is classified the same way, shown as 40,100 pounds.

Q. There is a difference of 20,200 pounds, is it not?

3692 A. Yes—it comes to me, Mr. Moore—I don't know that it applies to these particular cars that we have discussed, but we found a great deal of billing for a movement of ties from points in Tennessee or Mississippi, on the Illinois Central, through Memphis, which had originally been billed at Memphis through to the Union Pacific Railroad, and the Auditor's record showed that the heading of those way-bills had been corrected to read to Kansas City—I believe for the reason that through billing was unauthorized, and I recall—and I think if the tissue book were brought up here it would bear me out—that a great many hand copies of way-bills were posted in the book for which there were already tissues copies in the book.

I notice that the lower weights on this train 92 are in my figures. Also that the other trains we have taken up on these same cars of ties are in Mr. Wright's figures. It is possible he got one copy of the way-bills, while I got the other.

However, an examination of the impression book will show that and bear out my statement that there were a good many duplicate copies of billing for these cars in the Auditor's record.

Q. These are the weights, though, that you used in making up your ton miles on local trains?

A. From these sheets; yes.

Q. Take car I. M. S. 4753, October 1st, train 295, and see what you have in regard to the movement, weight and classification

3693 of that?

A. I find that that car moved from Wynne to Bald Knob, destined to some point in Kansas—it is not quite decipherable, now,—it is said to contain interstate tonnage of 58,300 pounds.

Q. Take the same car on train 92, on October 2nd, and see what you have there?

A. It does not appear on these sheets, on that train. It is not on that train on the second. It appears on that train on the third.

It shows a movement from Bald Knob to Newport for some Kansas destination and is said to contain 60,000 pounds of ties for the company's use.

Q. That is company material, is it not?

A. Yes, sir. Without examining the bill, I would not be able to say whether the car was a confiscated car of commercial ties or whether it had been erroneously classified.

Q. In one movement it is classified as "interstate" and on the other, as "company material" on your working sheets there?

A. Yes, sir.

Q. Now, take Big Four, 20,719, on train 295; it is on the Memphis division, October 1st?

A. It is shown as moving from Wynne to Bald Knob, to a destination said to be Kansas City, interstate business, 38,000 pounds.

3694 Q. Take the next movement of that on October 2nd, on train 92—may be it is the third—either the second or third?

A. I find that classified as "interstate business, 60,000 pounds.

Q. A difference of 22,000 pounds?

A. 22,000 pounds.

Q. Now, take M. C. car 16987, train 295, on October 2nd, and state the number of tons on that car?

A. The car is shown as containing interstate freight, 60450 pounds.

Q. Take it up on the second or third of October on the next movement you find there?

A. I find that car on the third of the month on train 92, with a weight of 49,200 pounds.

Q. That is a difference of 11250 pounds, is it not?

A. Apparently, yes.

Q. Take car M. K. & T. 15805, October 2nd, on train 295, and give me the movement of that with the weight.

A. The car was moved from Wynne to Bald Knob, containing 58800 pounds of interstate freight.

Q. Now, take it up on train 92, on October 3rd, and state the movement and weight?

A. Interstate freight 45,600 pounds.

Q. That is a difference of 13,200 pounds, is it not?

A. Yes, sir.

3695 Q. Take it on train 296, October 7th.

A. I find that is shown there as 50800, instead of 58,800; that would be an error in copying.

Q. Take car D. R. G. 10714: train number is 92 and the date is October 3rd.

A. Where is that moving?

Q. From Baring Cross to Newport.

A. I find that car was moved from Argenta to Newport, the destination said to be Carthage, Missouri. It is classified as "interstate freight, 34,800 pounds."

Q. On October 6th, train 246, is the next movement shown here: see what the weight there is. This is from Newport to Cushman.

A. I find that car classified on that train is interstate freight, 37,900 pounds."

Q. That is a difference of 3100 pounds?

A. 3100 pounds.

Q. Take the same car on train 296 on October 7th, the next day, from Batesville to Cotter, and see what the weight there is?

A. The movement from Batesville to Cotter is shown to contain "interstate freight, 48,600 pounds."

Q. That is 13,800 pounds more than is shown on the first movement, is it not?

A. Yes, 13,800 pounds.

Q. And it is 10,700 pounds more than is shown in the second movement, is it not?

3696 A. Yes, sir.

Q. Now, take car M. P. 30166, train 92, October 5th, from Baring Cross to Newport, and state the weight and classification of that.

A. It is said to have been hauled from Argenta to Newport, destined, according to the wheel report, to Hoxie, Arkansas; classified as state business, 69,200 pounds.

Q. On train 92, October 7th, you will find the same car: see what the classification and the weight is there?

A. That cannot be in the same train because it completed its journey so far as this train is concerned.

Q. It is the other end, is it not?

A. No, sir, the train runs from Newport to Argenta and from Argenta to Newport each day and they only——

Q. At any rate, the next movement of that car, what train is it on?

A. I have it 92 from Newport to Hoxie, which is a different train on the same division.

There are two trains numbered 92 up there.

The car moved from Newport to Hoxie, but here the destination is shown as Cairo.

What is the date of the next movement you gave me?

Q. October 5th. What is the weight shown on this last one?

A. Just a minute, please, until I look that up. (Referring to paper.) The car went into Hoxie on the 5th and is shown on the 7th, two days later, as going back from Newport to Hoxie,
3697 with a different destination.

I have no assurance that that car was not made empty at Hoxie, sent back to Newport and reloaded in the 48 hours intervening. The one conductor shows it destined to Hoxie and the other to Cairo. I will have to examine the wheel report and billing as we did to show it was two different movements.

Q. What was the weight of that car in the last movement, train 92, Newport to Hoxie and the classification?

A. Understand, Mr. Moore——

Q. I understand, you say it may or may not be the same loading, but I want to get your record.

A. That would necessitate an examination of the billing.

Q. I want to know what your record shows is the weight of that?

A. I will give you that in a moment.

The second weight, in which we show the car as destined, not to Hoxie but to Cairo, shows a weight of 61,200 pounds and is classified as interstate, which would be correct if its destination were Cairo.

Q. There is a difference there of 8,000 pounds?

A. There would be no difference where there is no comparison, and I don't know that it covers the same movement.

We found lots of those cars in very active service.

Q. At any rate, between those two weights there is a dif-
3698 ference?

A. Considering those figures in the abstract, yes, sir.

Q. How do you treat it there? Do you treat it as one car in your figures?

A. No, sir, I have two movements of it, two different trains.

Q. Mr. Hamilton, on the first movement shown here—from Baring Cross to Newport, is it not?

A. Yes, sir.

Q. The date is October 5th?

A. Yes, sir.

Q. That would probably take that date, to get that from Baring Cross to Newport on a local train by daylight?

A. Possibly, yes, sir.

Q. You say that car was destined to Hoxie; when would that car reach Hoxie in the ordinary course of business, would you say, it being now, as shown here, its first movement from Baring Cross to Newport?

A. It could have reached Hoxie in very short order. The local freight train from Hoxie to Newport goes down and back in a day, but I suppose a through train would take it up there in a few hours.

I do not know the exact schedule time of through freight, but it is only a few hours difference between Newport and Hoxie. They

are not very far apart. It could go up there on an ordinary through freight train in three hours.

3699 Q. You mean that would involve a second movement between Baring Cross and Hoxie?

A. It would mean that it moved from Newport on a through train that evening.

Q. It would get there that evening, it would have to be unloaded, would it not?

A. At Hoxie?

Q. Yes.

A. No, sir.

Q. If you assume it is two different cars?

A. Yes.

Q. And then carry it back to Newport?

A. Yes, sir.

Q. And load it there for Cairo?

A. Yes, sir.

Q. Would it have been in accordance with the rules used in operating trains to have started that car out on a local train billing to Hoxie—from Baring Cross to Hoxie—and transfer it from that train to Newport on another train going to Hoxie?

A. It would have to transfer into another train upon arriving at Newport in a local, because that is the terminus of the local's run.

Q. But on the next movement you see the same car got to Hoxie on train No. 92?

A. Yes, with an interval of 48 hours.

3700 The only way to tell that would be to find the way-bill to cover——

Q. We will pass that; it is not worth while taking more time for it.

A. We found a lot of cases of that kind where there were two very close movements of cars. I speak from memory—and that might have been one of them.

Q. Now, take car Big Four 20725, October, 7th, on train 92, from Baring Cross to Newport:

I want you to show the weight of that car and its classification on that date.

A. That car is shown as moving from Bald Knob to Newport. The conductor said its destination was St. Louis and we have classified it here as interstate business, 42,600 pounds.

Q. Did you go to the way-bill for your classification?

A. Yes, sir. I see nothing in what I have said to——

Q. You said the conductor said on the wheel report——

A. I am just giving the information I have here.

Q. What is the next movement of that on October 12th, train 92?

A. That fellow had five days at Newport.

It moved out of Newport classified at 42,300 pounds and this time in the trans-state.

Q. There is 300 pounds difference in the weight?

A. Yes, sir.

3701 Q. Suppose that weight should have been 47,800 pounds: of course, you have nothing there to show it and neither have I, but that would have made quite a difference?

A. A difference of 5500 pounds, if that were the correct weight.

Q. Take car Q-43197, train 92 on Oct. 19.

3702 A. I find that car moved from Little Rock terminals,—from Baring Cross, to Newport, and that it was classified as 44,700 lbs. of state business.

Q. Turn to train 246 on October 20, next day, and see what you find there about that car?

A. From Newport to Cushman on the 20th; it is shown now to be destined to Webb City, according to the conductor, and has interstate business of 45,800 lbs.

Q. So there is a difference of a few thousand pounds in weight, and difference in classification, transferred from state to interstate?

A. If it is the same movement, yes, sir; one movement, according to our memorandum here, is shown to be destined locally to Newport; the other, on the succeeding day shows the car destined to Webb City, Mo.

Q. Take car M. P. 62141, train 92, from Newport to Hoxie on Oct. 1st, what do you find there to be the weight and classification of that car?

A. That car is said, on this sheet, to be destined to Carthage; that is the conductor's information, and to have contained interstate freight 54,600 lbs.

Q. Now turn to train 294, Cotter to Crane, and see if you find that same car there, and what its contents is?

A. Yes, sir, I find it on October 8th, train 294, seven days later, on the White River Division; there it is shown to be destined to Crane, Mo. Apparently that was the end of the division and the conductor got mixed on it, but it now contains company supplies; that was seven days later.

3703 Q. What is the weight?

A. 20,000 lbs; that is seven days later than the other movement.

Q. It was shown to be an interstate movement on the first movement?

A. Yes, sir; where the car was in the interval, I couldn't say; in the first movement, it was destined to Hoxie, and in the second movement, it was destined to a White River point.

Q. Isn't it destined to Crane, Mo. in the first instance?

A. That is the second move.

Q. Isn't it true also of the first?

A. My record doesn't show that; it may have been; the conductor showed in the first instance it was destined to Carthage, and we have apparently located the billing on that examination; I see there is a check against the destination, indicating to my mind it was found there; this other movement is seven days later; whether those two will compare or not, I cannot say; it is quite possible for the car in seven days to go from Newport to Carthage, and again moved seven days later, in company service, from Cotter to Crane; they are not a great distance apart.

Q. Turn to car I. C. 33909, which moved on Oct. 8th, on train

245; what is the weight and classification of the freight? That is Cushman to Newport.

A. I haven't it here.

3704 Q. May be it is on train 295.

A. The train I had is Cushman to Newport.

Q. 295 is Cotter to Batesville?

A. Yes, sir; it is on train 295 from Cotter to Batesville, southbound.

Q. What do you find there?

A. The car is shown as going from Silamore to Batesville, and the ultimate destination of it is shown as Paragould, and it is classified as state business, 67,200 lbs.

Q. Turn to train 91, Oct. 11, Newport to Argenta, what do you find there?

A. Moving from Newport to Bald Knob, and said to contain 45,000 lbs. of company freight; here the destination is shown as station 937, which is apparently in error, because the car is moving south from Newport, and the destination indicated by the conductor is Cairo, Ill., which is north. The destination given on the first sheet is Paragould, which would require a northward movement from Newport to Knobel; this car seems to be going the other way.

Q. You have there train 295, and then I gave you the last train 91; in between that, there is train 245, Cushman to Newport?

A. Yes, sir.

Q. It is not worth while to look at that, because the weight and classification is the same there as on train 295, and you find it the last time on train 91.

3705 A. That wheel report on 245 confirms the statement that the car is destined to Paragould; I notice here that we have noted in the waybill reference, that the car was waybilled at Silamore, and the weight was the same. I would infer that either the number of the car shown in train 91 is in error, or that same was reconsigned, or other disposition was made of the car; the two movements of the car on the White River division indicate it being destined to Paragould, which would require a northward movement from Newport, but the train on the main line is hauling it south to Bald Knob; there is no indication that it is the same movement; of course, I don't know that it is not, but it seems improbable.

Q. The difference in the contents of the car is 12,200 lbs., and the classification is different?

A. If it be the same movement the comparison is right; I don't know how you could compare them if they were not moving under the same waybill.

Q. Can you move either way, north or south, going to Cairo; it might go off the White River Branch via Bald Knob?

A. I can't conceive of anything short of a blockade on the main line that would take it all the way around by Bald Knob to Cairo.

Q. It might go by the way of Paragould then.

A. I am not clear as to which is the short haul, but I can tell you in a minute; it would be a longer haul by way of Bald Knob, considerably.

Q. If it would go the other way, would it go by Paragould?
3706 A. By Knobel, which would be north of Newport, and then down the branch 20 miles to Paragould; it would be a somewhat longer haul the other way; it might go the other way.

Q. That is one of the cases we were discussing the other day, when you were testifying in regard to the movement of trains and retention of trains in terminals, and you were talking about the back haul through Knobel?

A. Yes, sir.

Q. This business might have gone to or from Newport, south by way of Bald Knob or north by way of Knobel and gone to Paragould?

A. Yes, sir, there is a choice of routes.

Q. This had to travel a good distance on that line from Silamore?

A. Yes, sir; once you get the car to Newport, it is just a question of which route you take on the main line; the shorter route is by Knobel; of course, it may be the same movement, but it is not linked up here.

Q. Turn to Missouri Pacific car 29263 on train #91, the first move, Oct. 14, Bald Bnob to Judsonia?

A. Yes, sir.

Q. What do you find to be the weight and classification?

A. Said to be moving from Bald Knob to Judsonia, and to be destined to the latter point, and to contain company material, weight of 82,200 lbs.

Q. On Oct. 17, on the same train, I take it that stuff moved from Judsonia to Kensett, showing the same weight and classifica-
3707 tion; see if you find that?

A. Yes, sir.

Q. On Oct. 21, the car moved still on the same train, from Kensett to Higginson, what is the contents and the classification of that movement.

A. It is shown as containing state business, 80,400 lbs.

Q. On Oct. 30, you will find car on the same train from Higginson to Garner, what is its contents on that occasion?

A. The car is shown again as containing coal, 82,900 lbs., of interstate business.

Q. So that car appears to be classified company material, containing state business, and containing interstate business, on these three movements?

A. You will notice that on the first move from Bald Knob to Judsonia, the car contained 1800 lbs. more than it did on the second move from Judsonia to Kensett. That is a Mo. Pac. coal car, my memorandum on the margin of these sheets indicates the car was loaded with coal; that looks to me like a car of station coal, peddling down the line, but that does not account for its commercial classification during the last move; there was a lot of coal stored at Bald Knob during that period, I take it as being company coal; it was a car which was partially emptied, probably, but sent on down the line, and that accounts for the decreasing weights, where it is classi-

fied as company business; whether it was eventually handled as commercial coal, I couldn't say.

3708 Q. That doesn't account for its being classified as company business?

A. Not for the last moves.

Q. Take up car Erie 51746, train 91, Oct. 4, that car moved from Hartshorn to Newport, what was its weight and classification.

A. I do not find an Erie car in train 91 between Newport and Baring Cross on the 4th.

Q. I said Hartshorn, I should have said Hoxie?

A. That is shown as picked up at some point, moving to Newport.

Q. The first movement, I call your attention to, is from Hartshorn to Newport.

A. Yes, sir, moving from Hartshorn, which is the second station north of Tuckerman to Newport, shown as containing 87,400 lbs. of interstate freight.

Q. The next movement is on train 91, from Austin to Baring Cross, that is on the 14th of October.

A. I do not find the same car.

Q. On the 12, it moved from Newport to Austin, and on the 14th it moved from Austin to Baring Cross.

A. The car moving from Austin to Baring Cross on the 14th is 51,796 Erie.

Q. Returning on the 12th, Newport to Austin, train 91, what do you find there?

A. No, sir, that is car 51,796; those car numbers have been checked by the transportation department to see if they were right; I will say for your information, if you desire to compare the

3709 movement of 51,796 Erie on the 12th and 14th, there is a difference there of about 400 lbs., I think—there is no difference practically—the cars are classified and the weight is the same on both trains.

Q. Do you recall that the car reports show that the conductors made a mistake that day in those cars, and that those are really the same car, that the number was 51,746, and that he made a mistake in entering it on the list as 51,796?

A. Not out of this multitude of cars; I would say for your information, that we attempted to use the company's car records to locate some of these cars, and we gave up in despair. We found that back in 1907, under another management than that which now has charge of the car accountant's office, the car account was not very reliable; I found many instances where the car was entered under two or more different movements, under two or three different conductors on the same day, and I endeavored to find some of these cars in the car record, but it would show the car in question in Kansas or some other place the same day we had it in Arkansas; we had very little reference to them, but what we did do, we found they were of no use to us.

Q. Give us the weight and classification of that car?

A. Which?

Q. Moving from Newport to Austin and Austin to Baring
3710 Cross, car 51796.

A. I have a move of 51796 Erie on the 12th of the month, from Newport to Austin, and the weight is classified as interstate 87,800 lbs. I find the same car, 15,796, Erie, moving on from Austin to Argenta, two days later, and it is classified in exactly the same way, same weight and same classification.

Q. How is it classified on the 12th?

A. Interstate, 87,800.

Q. Isn't it classified as trans-state on the 14th?

A. No, sir, not on this sheet.

Q. Do you know the character of that tonnage?

A. No, sir, I would have to see the waybill.

Q. Turn to car P. L. 559,115, train 91, Oct. 25.

A. I find 559,115 Pennsylvania Line, on that day; it is shown as moving from Hoxie to Newport, and is said to have contained state tonnage to the amount of 56,300 lbs.

Q. Turn to the same car on train 91, Oct. 26, and see what the weight and classification there is?

A. That shows to have been loaded with 44,100 lbs., and it is classified here as interstate business, but it is moving from Bald Knob; there may have been a confusion of car numbers there, for this reason; here is a car moving on the 25th from Hoxie to Newport, and the next day, it shows it is picked up by another train at Bald Knob.

Q. What I want to know is, if your working sheet, your
3711 abstract shows that car, the number which you have there, moving on those two days and on those two trains?

A. Yes, sir, and it shows a missing haul in there between Newport and Bald Knob, when probably it is the same movement, with a through train movement during the night.

Q. The difference in weight is 12,200 lbs., and it is classified one time as state and the other as interstate freight?

A. Yes, sir, if it is the same movement.

Q. I want you to take C. B. & Q. 100,718, less than carload shipment of an automobile.

A. I wouldn't know that from this sheet; it might be a less than carload or carload; it is optional to take the carload rate, minimum or less than carload rate; sometimes the carload rate is cheaper.

Q. That moved out train 91?

A. I haven't the movement here on 91.

Q. On Oct. 23?

A. Yes, sir, the weight shown isinterstate business 20,000 lbs.

Q. Take the movement from Swifton to Newport on the 25th on the same train?

A. I find the same number two days later, moving from the station at which it was set out by the other train, differently classified; in the first instance, the conductor shows that the car was destined where it was set out; in the second instance, where the
3712 car is classified, it is shown as trans-state, and the destination is shown as Alexandria, La., which I find is checked; it

would occur to me that the car was unloaded and re-loaded, or possibly re-consigned.

Q. What does your sheet show as to the weights and classification?

A. Into Swifton, 20,000 lbs., from Swifton into Newport, 10,000 lbs.

Q. Take the same train south, 91, and state what is shown on the movement from Bald Knob to Baring Cross on the 26th of October?

A. The car now is said to contain wheels, company material.

Q. No weight given?

A. We didn't bother with the weights, because at that time, we were not going to use company material weights, and didn't classify them; this is a copy of the wheel report for a train that was missing on our first check, which Mr. Emlett very kindly obtained for us. That is why there are no company weights on there where there was on the other sheets.

Q. Take M. P. 62173, train 295, 10th of October, moving from Earle to Wynne.

A. That car was billed from Earle to Wynne, the man said it was destined to—looks like Ft. Smith; apparently it was not classified as state business; 80,000 lbs.

Q. The next movement is on the same train from Wynne to Bald Knob, what is the weight there?

A. Yes, I find it; it is classified as state 73,800 lbs., a differ-
3713 ence of 6,200 lbs. I assume that we had the billing on that car, on the first movement before it was weighed, and the next time, had it after it was weighed, or there is a mistake there; I think we had the billing in one case; I am inclined to think we had two waybills for one car or to give two movements.

Q. Do you remember where that shipment originated?

A. No, sir, I am just assuming that as it would probably account for the difference.

Q. I am told it was really an interstate shipment.

A. I would have to see the waybill to determine that.

Q. Take Mo. Pac. 600,07, lumber from Norvell, Ark. to Kansas City, Mo., train 295, Memphis to Bald Knob, 22nd of October.

A. I find M. P. 60,007, moving from some point on the Memphis Branch to Wynne, said to be destined to Kansas City.

Q. What is the weight of that?

A. 79,800 lbs, interstate.

Q. The next movement is on the 23rd from Wynne to Bald Knob?

A. Yes, sir.

Q. What are your weights there?

A. Shown there as interstate, 66,0004.

Q. That is a difference of 19,400 lbs.?

A. Yes, sir.

Q. Take car #58,581, New York Central & H. Railroad, 21 of Oct. Movement from Newport on train 245, Cushman to Newport?

3714 A. I find that car moving from Newark to Newport in that train on that day, shown as interstate 13,500 lbs.

Q. Isn't it 12,500, that is the figure- I have here?

A. No, sir.

Q. Look at the same car in train 91 from Newport to Baring Cross, on Oct. 22, and see what its weight and classification is?

A. That car is moving from Newport to Baring Cross on the 22nd, and it is said to contain 47,100 lbs. of state business; the first move was from Newark to Newport, and the weight of the contents, and the memorandum which we have on the sheet here, indicates that it contained cotton; I assume if it contained cotton in the first instance, the cotton was unloaded at Newport; 47,100 lbs. in the car south out of Newport was not cotton, because you couldn't get it in the car.

Q. The difference in the weight is 34,600 lbs.

A. Yes, sir, if it covers the same shipment, which I doubt, because there is a compress in Newport which would undoubtedly take care Newport cotton.

Q. There is a difference in the classification too?

A. Yes, sir, cotton is all interstate in Arkansas; the point I was making is that if the car carried cotton into a compress point such as Newport, it would undoubtedly leave it there, and the other movement showing a different weight, I would think there was a different shipment.

Q. The waybill showed it contained 35,600 lbs. of cotton seed.

3715 A. After it left Newport.

Q. I understand the waybill shows that.

A. I would have to see the waybill to say that; it looks to me like two movements.

Q. One is on the 21st and the other the 22nd?

A. Yes, sir.

Q. The next movement of that car was from Bald Knob to Baring Cross, can you turn to it without the date?

A. On the 24th, from Bald Knob into Baring Cross; this time it contains cotton seed, said to be loaded 60,000 lbs.

Q. That is a difference of 12,900 lbs. in weight?

A. Yes, sir, if they are the same movements; those are into one point and out, and into another point and out, as you go along.

Q. I want you to take up car 6607 C. H. & D., train 97, Malvern to Texarkana; on the 4th of October; it moved from Malvern to Prescott; state the weight and classification?

A. That is shown as moving from Malvern to Texarkana, 857 to 894,—that is Texarkana.

Q. On the 4th of October?

A. Yes, sir.

Q. What does the record show?

A. Said to contain 27,248 of state business.

Q. See if there is a movement of that same car on that same train Oct. 14?

3716 A. You have got to the end of the road when you get to Texarkana; it couldn't be a connected movement of that

car; it would hove to be in the opposite direction or another movement; you see, if you moved the car in the first place from Malvern to Texarkana, you couldn't move it any further.

Q. Your sheet there from which you have made up these figures, shows that it went on a continuous journey from Malvern to Texarkana?

A. Yes, sir.

Q. That, of course, would indicate that the next movement was a different car?

A. I should judge so, especially so as it is ten days later.

Q. I want you to give me the movement of that number of car on the 14th?

A. I find that this car on the 14th, 6607 CH&D, moved from Prescott to Hope; that movement is entirely inside the first movement, and ten days later; in the first instance, the car is shown as moving from Malvern to Texarkana, and it would, of course, complete any journey it had to make on the Iron Mountain, when it got to Texarkana, and it would, of course, complete any journey it had to make on the Iron Mountain, when it got to Texarkana; this second move is from Prescott to Hope. Undoubtedly, it is not, according to my mind, the same movement; in the first instance, it is shown as being destined to Texarkana, and the second instance, to Hope.

Q. Where did the information as to the movement of the first car from Malvern to Texarkana, which sheet does it come

3717 from?

A. It comes from the wheel report and is put on this sheet.

Q. We will have to go to the waybill, of course, to settle that; give the weight and the classification of the car on the 14th?

A. On the 14th of October, I find car 6607 CH&D moving from Prescott to Hope, and in that instance, I find the weight shown as 60,300 lbs. I see no connection between that movement and the one previously mentioned on the 4th of the month, where it is shown on the wheel report that the car was taken into Texarkana, as far as it could go on Iron Mountain rails; I don't believe they have any relation one to the other.

Q. What is the second classification?

A. The second is trans-state apparently.

Q. Take car 10426, ART, that moved on the 16th of Oct. from Cotter on train 295, from Calico to Batesville, state the weight and the classification.

A. 10426 ART shown as being destined to Newport, contained 8,000 lbs., cotton for the Newport compress, and it is classified accordingly as interstate business.

Q. Take the same car on the 24th from Batesville to Newport in train 245, and state its contents?

A. I find a movement ten days later, from Batesville into Newport; this time the car contins 30,100 lbs., of state business; the other was evidently a cotton movement; the car has perhaps been into Newport and back out to Batesville for another load.

3718 Q. The waybills will determine that?

A. You may find two waybills; it would determine for

each movement, for the two movements; there would be two waybills if there were two movements.

Q. I want you to take cars 169 B. C. R. N. and 230 L. & E., on train #98, the 18th of October, and see what you find on that date, in regard to those cars, in respect to weight and classification?

A. 98 is from Texarkana to Malvern; I find both those cars, and they are said to contain each 40,000 lbs. of bridge material, company business, property of the Iron Mountain road.

Q. Turn to the same cars the next day, the 19th, on train 96 from Arkadelphia to Malvern, and see what they show; the weights are the same, see what the classification is?

A. There is a reference on this sheet, in my own handwriting, that the cars are on both trains; I say on one, see 96, on the other, see 98! whoever copied the *the* weights there has copied them in the wrong column; that soaked the state business with 80,000 lbs. of company freight.

Q. It entered into your figures as 80,000 lbs. of state freight?

A. Yes, sir, the state got the worst of it about that; we went through a lot of those trains and matched them that way to save extra work; whoever copied them, copied them in the wrong column, side by side.

3719 Q. Take car 14,411 M. K. & T., train 97, Malvern to Texarkana, Oct. 29, car moved from Arkadelphia to Gurdon; state what the weight and classification was?

A. The car is shown as moving from Arkadelphia to Gurdon and contained 8200 lbs of interstate freight, apparently cotton.

Q. On the next day, Oct. 30, that car moved on train 891, from Gurdon to Camden?

A. Yes, sir, the Camden Branch local.

Q. State what the contents and classification there was?

A. There it is shown to have contained 27,000 lbs. of state freight; they evidently unloaded the first load at Gurdon, and re-loaded it for a point on the Camden Branch.

Q. The billing will show?

A. Yes, sir, whether it was two movements or one; for two movements, there will be two waybills.

Q. I want to call your attention to car 36,963, I. C. on Oct. 9, train 845, frobm Buel to Van Buren.

A. That car is not on the train; I see a B. & O. car of that number.

Q. See if it went from Buxel to Van Buren, on the 9th of Oct.

A. I find that movement, yes, sir.

Q. What is its weight and classification?

A. It is classified as interstate business, 81,000 lbs.

Q. Do you find that car on train 191, on the 23rd of October?

A. That is 14 days later, isn't it?

Q. On the 22nd, Higgins to Wrightsville, see what your
3720 working sheets show in regard to that?

A. I find the same car, but carrying 60,000 lbs. of state business; but I don't connect it with the movement from Buel to Van Buren 14 days previous.

Q. What is the description of that car?

A. B. & O. 36,963.

Q. Follow that car on the 23rd from Wrightsville to Woodson, and state what your abstract there shows as to the weight on the same train?

A. I find the car moving from Argenta, according to this sheet, it is shown as moving from Argenta to station 4005.

Q. Did you treat it as a movement from Argenta?

A. Yes, sir.

Q. It is so shown?

A. Yes, sir, it overlaps the movement you quoted before.

Q. I will assume that is a mistaken, the wheel report shows it is from Argenta to Wrightsville?

A. Yes, sir.

Q. State what the weight is?

A. If you are comparing those movements, which there is no basis here for connecting, I can give you the separate weights of the two movements; one is 60,800 lbs. of state freight, and the other is 80,200 of company coal; the car is a company car; the first movement, Buel to Van Buren, is still more remote.

3721 Q. Take the same car on the 25th from Woodson to Redfield.

A. There I find the car moving from Woodson to Redfield, and the tonnage is 66,300 lbs.

Q. Take the same car on the same train the next day, the 26th, Redfield to Pine Bluff, state what the weight is and classification?

A. The car is moving there, classified as company material, said to contain 80,000 lbs. It seems extremely probably to me, that there were two cars of some similar number moving on that line.

Q. Take the same car on train 193, moving from Pine Bluff to Varner on the 28th, and see what you have in regard to that car?

A. That is still two days later; I don't find it under that initial; I find now that I have car 36,963 B.M., that is said to contain company coal 62,600 lbs.

3722 T. A. HAMILTON.

Cross-examination resumed by Mr. Moore:

Q. Mr. Hamilton, how do you account for the mistakes to which your attention was called, in the weights and classification of cars as they appear on your working sheets?

A. I would like first, Mr. Moore, to satisy myself that they are all mistakes.

Q. Assuming that they are mistakes: how do you account for them?

A. Human fallibility.

Q. If those mistakes were of any considerable extent they might very seriously affect the value of your exhibits, might they not?

A. If expressed in ton miles the net difference was such as would materially change the percentage shown on Exhibit I, to just the

extent that they affected that percentage they would impair the value of our exhibits.

Q. I believe you stated that you took these weights from the waybills, did you not?

A. Those were my instructions to the gentlemen working under my supervision, yes, sir.

Of course, you understand, Mr. Moore, that in the tabu-
3723 ulation of a statement of this size, it would be impossible for me to see every figure. Had I done that, I would have compiled the statement myself.

Q. I understand, Mr. Hamilton. No one man can do that. You have to rely upon the skill and accuracy of others.

A. Speaking of the effect, Mr. Moore, that changes of the character I have outlined, might have on this statement, I would like to refer to a somewhat similar check that I had occasion to make in the Missouri Rate Case.

The Missouri Pacific Railway submitted a large statement as showing the effect on the Company's passenger earnings of the operation of the two cent fare law.

I recall it took some three or four six-months' periods before, after and during the operation of that law.

On behalf of the State of Missouri, we checked that statement. I, personally, did a great deal of the work; in fact, a major portion of it, and as I recall it, there were between 1500 and 2000 errors in the statement, which I, however, tabulated as I went along.

When I got through and figured up the effect of those errors, give and take on the statement, I found that the net difference was so small that we approved the figures.

It is so in large statements of that kind where work is condensed into a comparatively brief space of time and worked up hurriedly,
but where the principle on which the statement is correct,
3724 and the work is conscientiously and consistently done, I always have great faith in the net result, regardless of minor errors.

Q. Did you make any comparison of the weights that are contained in your abstract sheets with those shown in the Company records, to see that they corresponded as to this local tonnage?

A. Those weights were derived from the Company's records as to each particular record.

Q. You did not make any particular comparison?

A. We got them from the record in the first instance.

Q. For that reason you saw no necessity for comparing them?

A. We saw no necessity of doing the work twice.

Q. It would have been a verification, would it not?

A. It would virtually have been making the statement twice.

Q. In allotting or determining the amount to be charged to interstate business, did you take into consideration the fact that the movement of empty cars in local business was very large, nearly 100% of the cars that were hauling the following commodities:

Lumber and other forest products to manufacturing centers; cotton seed to oil mills; coal, stone, sand and gravel from producing

points to consuming points, would involve a return movement, either going—usually going—of empty cars?

3725 A. That would depend on many things, Mr. Moore.

Q. I mean now in the operation of local cars, in the conduct of this local traffic?

A. Whether it would be necessary to provide a return load for the car going in any given direction, or hauling any given class of traffic, would depend first on whether that car had to be brought back to the point at which the shipment originated, or to the territory in which it originated.

It might be a car belonging to another line, very advantageously home routed with a load in the direction in which it was going. The movement might be the reciprocal loading for some other movement.

It would require a man who knew exactly the details of the traffic on each piece of the road, to answer that quetsion as to whether there would necessarily be such an empty movement.

But if you ask whether we took that into consideration in dividing our state and interstate expenses, I will say that a car mile was a car mile to us.

Q. Which means that you did not take it into consideration?

A. I don't see how we could.

Q. Suppose it should turn out that upward of eighty per cent of that class of business involved an empty movement:

Would you not think that was a material consideration

3726 which should be brought out and taken into account in making the division of expense as between state and interstate business?

A. Our division, of course, was primarily between through and local trains, and it seems to me that we would have to have the exact factors as to which business caused the most empty movement, state or interstate, before we could intelligently answer that question and before anybody could pass on it.

Q. Now, apply it to the train itself, the train movement as between local and through trains:

There you have on local trains a condition under which there is a very heavy movement of empty cars which produce no revenue, but are an expense to the railroad company, and as to which there is no corresponding condition existing as to the through local trains:

Should that not be taken into consideration in determining the expense of operating the two classes of trains? Not speaking now of the business itself, but the operation of the two classes of trains?

A. I would first have to know why these empty cars were put on the local. It seems to me that the local in that case is relieving the through train.

As to the effect of it on the division between state and interstate business, we would have to know for what class of business the empty movement was made, whether it was an empty return

3727 movement of interstate business, or a movement to load interstate business, or the same for state.

Q. The matter I am speaking of is state business, because it is

lumber and forest products to manufacturing centers; cotton seed to oil mills—

Mr. HILL: What state—

Mr. MOORE: The state movement of these commodities.

Q. I am confining myself to that. Let us now pass from that to the effect upon the business itself—the traffic:

You divided your expenses on the basis of the car mileage and disregarded the loading of the cars: if the fact should be established that as to that kind of local business there was a large empty movement, would it not be a consideration that should be taken into account when you came to divide the expense as between state and interstate traffic?

A. I understand you to say about eighty per cent?

Q. I asked you if about eighty per cent of the traffic of the cars that hauled these commodities one way, don't result in an empty movement in the opposite way?

A. I don't see how eighty per cent of the Company's business, expressed in ton miles, which is the intrastate ton mile total, could possibly cause eighty per cent of the empty car movement.

Q. I did not state that. I said, if about eighty per cent of the movement—we will say in the transportation of cotton seed
3728 to the cotton mills—if about eighty per cent of the cars that hauled the seed to the mill, do not return empty to the point where they obtain the seed?

A. I have no information on that.

Q. I wanted to make it plain to you. I do not mean of course, eight or eighty per cent of the total movement of cars.

A. But you would have to first determine what the cars were hauled empty for in each class of train, before you could consider that factor.

Q. But if what I have assumed were true, would it not be an important element of expense? That is the point I want to call your attention to. I am not trying to prove whether it is true or false, but I am trying to ascertain your view as to whether it would be an element of any importance if it is true?

A. I would first have to have all the information I mentioned, before I could pass an opinion. I would not want to do so otherwise.

Q. What is the information you have to have?

A. As to the purpose of hauling those cars in the local train; whether they are hauled for the state or interstate traffic.

My understanding is that the state traffic takes care of itself prety well, in the way of empty cars. The dispatcher usually
3729 finds cars on his division to take care of his needs, except in the cases of every large movements, and it seems to me that they keep those cars pretty close at home, and the local would distribute as many cars at its way stations to take care of interstate business, as it does to take care of state business.

Q. Let us get down now to a simple basis by assuming that cars that haul these products—that is, lumber and forest products to

manufacturing centers; cotton seed to oil mills; and coal, stone and gravel from producing to consuming points.

In point of fact, the cars which haul those commodities from the producing to the consuming point, do in fact return; that is, a large proportion of them do in fact return empty back to the place where they were loaded.

Now, just assume that fact; that is all that is necessary for the proposition that I want to call your attention to. I want to know if, in your judgment, that would constitute an element of any importance in dividing the expenses, either between trains, or between local and through business?

A. If you will eliminate the question as between trains and confine it to a division between state and interstate business, I can answer it.

Q. Well, I will do that.

A. I will say that if your assumption that there is no
3730 return load for cars handling the traffic you speak of, in state business, and that you further assume that that is a large portion, that the statement is correct; that the extent to which there was no return load for those cars, there would be an extra expense of that business.

Q. You stated, Mr. Hamilton, that that local business took care of itself:

Do you mean that the cars that are employed in it, in local service, are retained at the local points——

A. I don't imagine that a dispatcher who knew his business would let cars lie around, there should be a great deal of loading at these stations where cars are made empty and in that case it would obviate the necessity of setting out cars. I should think a dispatcher would make his agent make use of his empties, sooner then send him any.

Q. Now, going back a little to your Exhibit I:

Your first column represents the ton miles of freight carried on local trains?

A. Yes, sir.

Q. Your second column represents the ton miles of freight carried on through trains during the month of October; both of these are the month of October?

A. Yes, sir.

Q. The last column, which is headed "Total" represents the total tonnnage, and expresses in the various ways as expressed in the exhibit, as you obtained it from the exhibits filed in the
3731 case by the Railroad Company——

A. Exhibit 26.

Q. Now, in making up your exhibits and preparing the figures upon which you have based your division of expenses, you made no effort through any investigation of your own, to ascertain what business was done on through trains? You confined yourself to the local trains: that is correct, is it?

A. We made no attempt to analyze the performance of through trains from the wheel reports.

Q. You determined the performance of the through train by determining the local trains—deducting that from the tables as ascertained from Exhibit 26?

A. Yes, sir; that is the plan.

Q. Of course, the correctness and the value of the figures prepared by you depends upon whether the two sets of figures—that is, the figures based on your investigation of local trains, and the figures shown in the column taken from Exhibit 26, reflect similar conditions?

A. That would seem to be the logic of it.

Q. Is it not true, Mr. Hamilton?

A. Yes, sir.

Q. What per cent of the total business did you investigate on the Iron Mountain road, as shown by you? It is about 11.18%, is it not?

A. Expressed in ton miles.

Q. What is it on the Cotton Belt road?

3732 A. 10.9%. Of course, that is Mr. Kimbell's figure.

Q. You have already testified, Mr. Hamilton, that you know how Exhibit 26 was made up:

State in detail what your understanding is as to the manner and the sources from which Exhibit 26 was compiled?

A. After we had our misunderstanding as to the mileage basis, which I referred to yesterday, at my request Mr. Roth furnished me with a memorandum as to how Exhibit 26 had been compiled, covering certain points that I desired specific information on, and it confirmed the verbal understanding I had had with him prior to that time, except on the mileage proposition, and I have that before me now. It expresses my understanding of how he got his figures.

Q. Please state what it is.

Mr. HILL:

Q. Is that Mr. Roth's statement? Read it into the record.

A. Yes. It covers a lot of minor matters that are not basic matters, but the basis on which he got his figures is in here.

Mr. MOORE: Read it in part or all, into the record.

A. "System business": The data is taken from the Company's journals. The journals are abstracts, as I explained in my examination in chief, of the way-bills, or the impression copies of the way-bills, on which the auditor basis his check of agents' "freight received" reports, and ascertains that the Company is getting its proper freight——

3733 Q. Are you still on the "journal"?

A. I have not quite finished.

Prior to journalizing those way-bills of course they should be—I don't know what the practice was just at that time—gone over to see that the rates and extensions are correct and that the revenue shown therein is the amount that should be collected by the agent. Some adjustments are afterwards had, necessarily, where there was a disagreement between the agent and auditor as to rates, weight, etc.

Q. What do these journal entries represent?

A. They represent the charge to the agent, in the first instance, for freight which he is to collect; the credit to him for freight collected at other stations and which is billed as pre-paid; the charges to him of advances to other stations, the collection of which he is charged with. They show the weight of the shipment and an index to its classification, for the purpose of the Company's statistics—that is, by commodities and classes.

In addition to that, they give the index of the way-bill number and date, and supposedly, in the case of carload shipments, the car number.

That information is grouped by receiving and forwarding stations in approximately a geographical order.

Q. What do you mean by the term "System Business"? You said "System Business".

A. Business intercharged between stations on the Mis-
3734 souri Pacific Iron Mountain System, which includes the Kansas branch lines of the System. That is ordinarily known as the "Missouri Pacific System". It would not take in the T. & P.; the I. G. N., or the Denver & Rio Grande.

Q. Does that journal show any freight in the month of October that was not billed in that month?

A. No, sir; it is entirely on the "forwarded" basis.

To explain what I mean by "forwarded basis" it is an abstract of the way-bills made at Missouri Pacific stations during that month, to stations on the Missouri Pacific.

Q. It then represents the date of the billing or receiving of the commodity at the station on the Missouri Pacific System at which it was received rather than the date at which it was moved?

A. Always the date of the billing. The date of the receipt might be, in extraordinary cases, in the next month.

Q. But it is the date of the bill and that is ordinarily the date it is received?

A. I suppose there would be very little of the Missouri Pacific business—I am not informed as to that. That is, that a shipment billed at one Missouri Pacific point, unless billed near the end of the month——

Q. It includes only such business as is actually billed in the month of October?

A. It is on a "forwarded" basis entirely.

3735 Q. I want to ask you if that billing record as it appears in the journal, actually represents that class of freights? I am going now to the "System business" that is handled over the rails in the state of Arkansas, during that month?

A. I can readily conceive where some business billed in a prior month would finish its journey on the System rails in the following month.

Q. That would not be included in that journal?

A. No, sir; it would be in the journal for the preceding month, on a "forwarded" basis.

Q. I believe you stated yesterday, when you were asked about

tracing the movements from the wheel reports to the waybills, that you went back into the waybills of September to get some of the bills that did not appear in the journal representing the October System business.

A. No, sir; it should have been journalized and was journalized in September.

Q. On the other hand, suppose a carload of freight, or less than carload, as the case might be, is billed in October and does not move until November or December:

That journal does not in that case reflect the movement over the rails of the railroad company?

A. No, sir; it reflects the date on which the shipment was waybilled.

Q. If such delays as you have indicated in your testimony
3736 existed in the forwarding business on that road, did occur and were as general as you have advised us they are, there might be a good deal of business billed in October that did not move that month, as shown in your "total" column?

A. There might be business, and there was business billed in September which moved in October.

Q. And in October which moved in November?

A. I can't say as to that. I was working on a movement basis and concerned myself only with the stuff that moved.

Q. If business was not in the habit of moving promptly and swiftly from the time it was received by the railroad, but there were delays, then what would be your judgment as to whether the commodities that are billed and shown on this journal "B" reports, could be assumed to have moved in that month, all of it?

A. It would be my opinion, Mr. Moore, that there would probably be as much October business moved in November, as there was September business that moved in October, the conditions being the same throughout that period.

Q. So this billing record, then, would not in fact represent the real movement of traffic over the rails of the railroad in Arkansas?

A. It would represent its way-billing dates.

Q. Mr. Hamilton, do you think there is a large percentage of that lap-over business from month to month, that you spoke of just now?

3737 A. Pardon me a minute. I have some figures here that I would like to refer to.

Q. Very well.

A. (After examining figures): I worked up from the Company's records the total freight train mile figures in Arkansas, for some months—for the entire six months in which we were interested, and I found that there is not a great deal of fluctuation in that figure from July to August; August to September; September to October; October to November, and November to December.

It runs along pretty well, and I should assume from that that if there was a heavy September lap-over into October, and if the Company ran almost as many trains in November as it did in October,

some of the October business would have lapped over into November. They would not run trains that they had no use for.

Q. Mr. Bee and other witnesses have testified that there was a blockade beginning in October of that fall, which impeded the movement of trains and the handling of freight: What effect would that have upon this particular month, October 1907——

Mr. HILL: Did Mr. Bee testify that there was any blockade on the Iron Mountain in Arkansas?

Mr. MOORE: I think so; yes, sir.

Mr. HILL: I would like to be cited on that.

Mr. MOORE: If he did, it has been stated—I asked him
3738 if he thought it was on that line and I think he stated it was, if I remember correctly.

Q. —and upon these fluctuations to which you referred a moment ago?

A. I find that in October, 1907, the figures taken from the Company's statistics show 274,000 freight train miles—in round figures; there are some odd; and in November, 268,000 freight train miles. Pretty close together. From that it would seem that whatever traffic conditions existed in October, also existed in November.

I base that, of course, upon the assumption that the Company would not run freight trains, except locals, until they had tonnage for them, and that the trains run were necessitated by the volume of business which was moving, and that the practically level train movement would indicate like movement in the two months.

Q. How was it in September?

A. September runs 265,000 train miles as against 274,000 in October.

Q. Do your investigations there show the per cent of the lap-overs, of the fluctuations in October?

A. Do you mean in ton miles?

Q. Yes, in ton miles?

A. No, sir. We interested ourselves in finding waybills to cover the movement of these October trains, and when I made the
3739 statement that some of them were September way-bills, I recall going to the September records for them.

Q. What would be the per cent of difference on state freight, if you can say, as shown by the records kept by the Company, showing the billing, and the actual movement as developed, we will say, by the exhibits introduced by the State in this case?

A. As we based our Exhibit I, on Mr. Roth's Exhibit 26, and the total intrastate freight on Exhibit I, expressed in ton miles, agrees with the total ton mileage of intrastate freight shown on Exhibit 26, and Mr. Roth states that he took his figures for Exhibit 26 from the Company's records, I should say that the total of our Exhibit I, agrees with the Company's records. It depends, of course, upon the accuracy with which Exhibit 26 was compiled.

Q. That is all right, but what I want you to state now is this: what is the difference, in per cent, in the state freight in the month of October, as shown on Exhibit 26, and the amount of freight

actually moved and handled on the rails of the Company in Arkansas, during that month?

A. To answer that question and to give you a mathematically exact answer, it would be necessary to work up the performance of the through trains, added to the performance of the local trains, and compare the result, expressed in ton miles, with Exhibit 26.

We have gone on the assumption that the lap-over from
3740 month to month, would take off trains, such September way-bills as are not included in Exhibit 26, and add to our trains such October way-bills which were included in Exhibit 26, and moved in November. So far as the actual train movement is concerned, the two are about equal.

Q. Do you know what proportion or part of the state freight in local trains was not included in Exhibit 26?

A. No, sir.

Q. Could you have found that by making an investigation?

A. Yes, sir, we could have tabulated the September way-bills which we located on our local trains.

Q. Would that not have given you some relation between the figures worked up by you and the showing made by Exhibit 26?

A. No, sir; there would have been another side to the proposition. I would have had to find out how much November movement on trains was on October business.

Q. What would have been disclosed to you if you had made that examination?

A. That there was included in the October train movement certain September ton mileage, according to the Company's journal records.

Q. Have you any idea, or can you state approximately what the per cent of difference is between the business shown by the Exhibit and that actually moved in state business that month?

3741 Mr. HILL: He has answered that question in different forms, about four different times. I submit it to the Master——

The MASTER: He may answer the question this time, but there is no need for repetition.

A. I have no information and cannot answer——

Mr. MOORE:

Q. I did not ask you that question before, or anything like it: I have asked you if you could state amounts, but now I asked you if you could state approximately.

A. I think my other answers would cover that. Unless we had tabulated those September way-bills we could not have told what the percentage of ton mileage covered by them was.

I said we had not tabulated the way-bills. To clear that up and reduce it to one answer, we worked entirely on the assumption that the lap-over of September billing into October, covering freight which we found on our October trains, was off-set by the lap-over of October billed stuff that got on to November trains. That is it in a nut-shell.

Q. Are the lap-overs in the same proportion, on state and interstate business?

A. I should assume that they were. In Mr. Kimbell's judgment the movement in October was typical of a series of years, so far as the relation of the two classes of traffic are concerned.

3742 Q. Have you made any investigation for the purpose of informing yourself, whether there would be any difference in the proportion of the lap-over between state and interstate freight?

A. No, sir. Inasmuch as we applied the percentage we obtained on this one month's business, to the six months' business, it seems there the lap-over would take care of itself pretty well.

Q. How would the proporition of the lap-overs compare as between freights carried on local trains and those carried on through trains?

A. Mr. Kimbell's assumption being that the two classes of traffic, state and interstate, would move in relatively the same volume for the six months, or for a period of years, that it did in October, I would have to imagine a violent change in the method of handling state and interstate freight, as between through and local trains, to make any particular difference.

I suppose the state freight that ordinarily traveled on local trains in October, would naturally follow the same channel in November, and the same is true of interstate, and also of the two classes on through trains.

Q. If we assume that the difference in state freight, as shown on Exhibit 26, as compared with that actually handled on account of lap-overs, was 4½%, and that the difference in interstate

3743 freight was 23%, would you think that that statement of the larger percentage of interstate freight seemed excessive, or do you think there would be as great a difference as that?

A. I will have to answer your question Yankee fashion.

Q. That is all right.

A. I infer from your question, Mr. Moore, that your percentage assumption referred to the September freight which was carried on October trains?

Q. I refer to this: I refer to the tonnage or amount of freight as reflected in Exhibit 26, that class of freight, state freight, and the amount that was actually handled and moved in the State of Arkansas—referring, of course, to the state freight first, and then afterwards to interstate freight.

A. The difference between the two would be the lap-over we speak of, and in my judgment would not exceed, if you consider both lap-overs, September into October and October into November.

If your percentages do not contemplate both those lap-overs, I should say that in my judgment they are not correct percentages.

If they contemplate the September lap-over only, you have stated only one side of the proposition. You would have to have all the factors before you.

Q. Let me explain: I am not assuming that it was a September lap-over, if that is what you mean; that is, business of Sep-

3744 tember that was carried or not carried:

I assume now that the total difference, as shown by an in-

vestigation of the business handled, according to the records upon which Exhibit 26 was compiled, and that actually handled upon an investigation of the performance of the local trains as made by you. Upon that basis I want you to state it.

A. I cannot see the ground for comparison——

Q. I want you to state the effect upon the relative business, state and interstate, if the difference in the interstate business was five times as great as on the state business.

A. It comes right back to the question of what went into these local trains' figures. In those local train figures is some September lap-over.

Now, considering that alone and comparing the relative percentages of those figures with Exhibit 26, which covers all of the billed or are counted for business of the month, you have left out an element, and that is the portion of billed or accounted for business in Exhibit 26, which moved on November trains, and you cannot consider one without the other.

The lap-over at both ends in those figures which you referred to as compiled by me covering local train ton mileage from certain September way-bills. Before I can compare Exhibit 26,
3745 which consists of all October business, as I understand it, I must know what there was of October business in Exhibit 26 that went on the November trains and how it compares with the lap-over from September. Then I can tell you how Exhibit I compares with Exhibit 26.

Q. Do you go upon the assumption that if this 23% I mention, is correct, as appears from the record, that there would be a similar lap-over and a similar percent in November?

A. That is what I stated, sir. My opinion is that the lap-over from month to month would be approximately the same.

Q. Do you work on that assumption?

A. That is what I stated in the first instance, that we worked exactly on that assumption.

Q. I wanted to get that clearly into the record.

Mr. Hamilton, I think you stated yesterday that your figures were made out on the same basis of those of Mr. Kimbell's, as shown in his Exhibits 19 and 20:

Did I understand you correctly?

A. I said, Mr. Moore, that there was no difference in the results so far as the carload business was concerned—or should not be—speaking of the ton miles, of course.

Q. I do not want to take time to turn to Mr. Kimbell's testimony, but as I remember, Mr. Kimbell testified that he obtained the data and made the basis of his figures by putting men on the trains, riding trains, and at terminal points, and obtaining from
3746 actual observation the movements: you did not do that?

A. No, sir.

Q. You took the data that was—so far as the performance of local trains was concerned—it was that alone you were dealing with—you obtained that in the same way as you described in your examination in this case?

A. Yes, sir.

Q. Are you correct in the statement that you obtained it in the same way that Mr. Kimbell did?

A. I do not believe I said just that, Mr. Moore.

Q. You do not intend to say that?

A. What I intended to say was——

Q. I may not be accurate as to that——

Mr. HILL: I will say that I called upon him to state the difference between the method followed by Mr. Kimbell and himself, and he made a calculation by demonstrating the difference in the less than carload——

The WITNESS: I take it, Mr. Moore, that what you are chiefly concerned in, is whether our results were similar——

Mr. MOORE:

Q. No, that is not it. I am trying to ascertain if you meant to say your method was the same?

A. No, sir; what I meant to say was this—and what I think I did say:

Mr. Kimbell placed men on the local freight trains who rode the trains and got the information from the way-bills in the con-
3747 ductor's possession. He placed men at division terminals who handled the way-bills brought into the terminal by through trains, which was practically riding trains; with this difference that they accepted the conductor's statement as to the freight set out between terminals. In that way he got his information from the way-bills. Mr. Kimbell—during my examination in chief—stated and I think the record shows it, that the reports of these men were corrected up in the Auditor's office on the basis of actual scale weights.

We worked from the impression copy of the way-bills on file in the Auditor's office.

I fail to see the difference.

3748 Q. Doesn't Mr. Kimbell's method give him all the freight that was moved on through trains from actual investigations?

A. I thought we were discussing local trains?

Q. No, I am discussing the whole situation; doesn't Mr. Kimbell's method give him the freight actually carried on through trains?

A. Mr. Kimbell's figures represent, if they are accurately compiled, and I doubt not they are, the movements on through trains, taking from the waybill covering the freight in those trains; I think I have explained two or three times now, that we did not work up any through train figures.

Q. Wasn't there any other difference in the methods and in the results?

A. Mr. Kimbell's method not only caused him to act with reference to the waybills, but he was dealing with the freight.

Q. His men were there present at the time on the trains, and didn't he, in his methods, eliminate that element of uncertainty

growing out of the lap-overs that would exist from taking the records from the billing of the railroad?

A. Undoubtedly, whatever elements of uncertainty there is, it exists in working up the accounts and statements as exhibit 26 is, and deducting therefrom an actual figure or calculation, obtained in a manner which closely approximates and brings the same
3749 result as Mr. Kimbell's local train figures; whatever the difference is, there will be that difference between the two methods.

Q. I believe it is shown that your exhibit I, does not show the average haul of state and interstate freight on local and through trains?

A. That would be impracticable, when they are carried in the same cars, in the case of less than carload business.

Q. It would be quite an important fact in determining these questions, if you could determine it, wouldn't it?

A. The average haul of state freight in a local train can be ascertained, but you would have to match up the haul of each particular shipment in every local train it travelled in, for its entire journey, to get at the average haul of state shipments on local trains, and then if it got on a through train for an intermediate haul, it would further complicate the matter; I don't believe figures on that kind would be of much value.

Q. On what mileage have you based your figures in ascertaining the performance of trains 205-6, between Cotter and Batesville?

A. I would have to see the sheets to tell you that.

Q. Haven't you stated you used the station book?

A. We had some discussion as to that; in checking over some figures placed on our sheets by the railroad people, I found a difference of a mile; I was shown a telegram by Mr. Johnson from the division superintendent to the effect that the mileage of that
3750 particular division in the station list was wrong; we had some discussion about it; there was a difference of one mile; I can look at those train sheets, and I would be glad to tell you.

Q. Wasn't that telegram to Mr. Amouck?

A. I think he was present, I forget who it was addressed to.

Q. Who was the telegram from, you said Mr. Johnson showed you the telegram?

A. I was at Mr. Johnson's desk, and Mr. Amouck was there, and we were discussing the matter, and the telegram was there between us, and the question came up as to the actual length of that division, and I know it was a question of whether it was 95 or 96 miles; the station list shows the mileage to be 96, figuring the fractions, 95.63, which we would consider 96 miles, and my recollection of that telegram is Mr. Amouck said the correct mileage would be 95.

Q. What basis did you use?

A. There is a conflict of authority there, one the company's official list, and the other a telegram from the company's superintendent of the operating department; it would be immaterial in either event.

Q. I want to call your attention to another condition in regard to the mileage; you testified, I believe, that you thought it would be

good railroading, and you would assume that local business would be handled in local trains. Now, take business off the White
3751 River Division, going to points we will say on the Valley Division, Pine Bluff or McGehee; what is the mileage shown on the railroad's schedules, and upon which that movement would be figured in the records on which exhibit 26 was compiled?

A. From a White River point to a point on the Valley Division?

Q. Say to McGehee, for instance. I mean, would the straight mileage from the originating point to the terminal station, be used by the railroad company?

A. You say to McGehee?

Q. Yes, sir, I am not asking for figures, I want the comparisons. How would the mileage on a movement of that sort be ascertained in the figures upon which Exhibit 26 is based?

A. My understanding is that the company, in its regular statistics from which Exhibit 26 was derived, figures short line mileage between points, or is governed by certain routing circulars.

Q. I am not speaking about the different lines of railroad.

A. They have routing circulars on their own line, and I assume that the actual movement except for some physical obstacle would be by short line mileage.

Q. I will assume the movement is by the way of Newport, Little Rock and Pine Bluff, eliminating any question about the routing.

A. Yes, sir.

3752 Q. Where would they go to get the mileage upon which Exhibit 26 is compiled?

A. They would take the mileage over the White River from the point where the shipment originated, through Newport, Little Rock and Pine Bluff to its destination, totalling the mileage, picking up or dropping the fractions at the end of the run.

Q. If a movement of that sort was broken up into three or four movements on three or four trains, and so appeared on the wheel reports, what effect would that have upon the relative mileage between—as shown on your figures and those on exhibit 26?

A. Picking up the fractional miles for each fractional part of that run—we picked up a fractional mile or dropped a fractional mile as the case might be; the way we figured, the run was cut up into sections, and the company figured their mileage from point to point, necessarily so.

Q. Trains #193, 194, 741, 742, 744, 745, and 743 to 746 inclusive, on the Central Division, I believe run from—those trains I mentioned carry freights, don't they, from points on the Greenwood branch to Van Buren?

A. Trains 193 and 194 do not run on the Greenwood branch.

Q. They run from Van Buren to Wagoner, don't they?

A. Yes, sir.

3753 Q. State the run of trains 741, 742, 744, 745, and 743 to 746 inclusive?

A. Train 742 runs out of Greenwood in the morning, runs through Ft. Smith to Greenwood Junction, back from Greenwood Junction to Greenwood, a round trip on the Greenwood Branch; runs from

Greenwood to Greenwood Junction again, and on that trip goes down from Greenwood Junction to Van Buren, comes back out of Van Buren to Greenwood Junction, and goes down the Greenwood Branch to Greenwood, and I suppose, ties up for the night; that is the only train they have, and the different numbers are given it for the different portions of the run.

Q. How are freights hauled from the Greenwood Branch to points in Oklahoma? Are they hauled on those trains?

A. Yes, sir.

Q. There is a haul of seven miles from Greenwood Junction to Van Buren?

A. That is about the figure.

Q. What mileage do you charge in the State of Arkansas on that haul?

A. My recollection is that on those little trains, that ran around Greenwood and Van Buren, and served the Greenwood Branch, there was very little business.

Q. That wasn't the question I asked you, Mr. Hamilton?

A. What little business those trains handled, we figured the mileage which the trains handled it, from the point on the Green-
3754 wood Branch to Van Buren.

Q. That would be seven miles down and seven miles back?

A. Yes, sir.

Q. How does that appear on the records from which Exhibit 26 was compiled?

A. If the business was waybilled from a point on the Greenwood Branch to a point in Oklahoma, the straight away mileage would be figured by the company.

Q. So on every ton of that class of freight, you have charged, by your method of figuring, 14 miles more mileage than appears on the records of the railroad?

A. Yes, sir, but you will have to get a microscope to find the tonnage; there was so little on those trains.

Q. I asked you is that wasn't a fact?

A. Yes, sir, that is true.

Q. There is a train that runs from Van Buren to Wagoner, isn't there?

A. Yes, sir, trains 193 and 194, you spoke of.

Q. Freight that originates at Van Buren and below there, and is pulled on that train, you take that into account in your figures, as a local train?

A. I don't know that I understand that.

Q. What I asked you is, how did you treat that part of the run of those trains that are scheduled to run between Van Buren and Wagoner; did you treat them as local trains in that territory?

A. It did seven miles of Arkansas work, and in apportion-
3755 ing the train expenses, that is the wages, for instance, we apportioned seven miles of that expense to Arkansas.

Q. You charged that mileage up?

A. Yes, sir.

Q. On every ton of freight that passed over it?

A. Yes, sir, it got a seven mile haul in Arkansas.

Q. Is there a station between Van Buren and the state line?

A. No, sir.

Q. Is that mileage included in the records of the railroad company, upon which exhibit 26 is based?

A. It should be if the statement is properly made.

Q. Did you investigate to see whether it did or not?

A. It is Arkansas traffic. We were told that the revenue and ton mileage in exhibit 26 were based on actual track mileage in Arkansas, and those seven miles are in Arkansas; if that isn't true, we have been misinformed on that particular.

Q. Those trains do not handle any Arkansas intrastate traffic do they?

A. No, sir, there is no station between Van Buren and the Oklahoma line at which they could deliver traffic, and if it crosses the line, it is interstate.

Q. All the traffic then is interstate?

A. Yes, sir, so far as Arkansas is concerned.

Q. Are they not in effect and practically, Oklahoma local trains?

A. They serve seven miles of Arkansas, out of a total
3756 run of about 83 miles in Arkansas and Oklahoma.

Q. They carry no Arkansas freight except interstate freight?

A. If there is no place between Van Buren and the line at which they can deliver business, all the freight must be interstate.

Q. The only question about that is whether it should be treated as a local train in Arkansas; an analogous condition exists also, between Eudora and Calvit, on the Louisiana State line; train 345 and 346, between Eudora and Calvit don't do any intrastate business, do they?

A. It is not exactly the same sort of situation.

Q. The only difference is that there is a little station near the Arkansas line on the Arkansas side.

A. You are assuming a whole lot; I found they did quite a lot of business there; I found quite a lot of freight at Indian station, Arkansas, going to Eudora.

Q. Is there any local business there of any consequence?

A. You mean business that originates or terminates there?

Q. Yes, sir, state the business you found there.

A. I would like to have the train sheets for that train; I can do it if I have them.

Q. The point I want to particularly call your attention to, is this: whether there is any state business of any consequence at that station?

A. I recall a movement of logs to Eudora.

Q. I am speaking of state movement.

3757 A. I recall a movement of logs there from Indian, Ark.—I think they went up to Halley, if I mistake not; there was a log movement there; how great it was, my memory doesn't tell me now. I had that impressed upon me that there was a log movement there, and those logs were state business. I didn't finish my

answer to your question in the first instance, as to whether I considered that this train was a local train in Arkansas, and whether the train you mentioned, running from Van Buren across the state line, was a local train in Arkansas; it is charged to Arkansas, the crew is paid local freight train wages; seven miles of its run is charged to Arkansas; I don't know how you could classify it otherwise.

There is this distinction between those two, that in the case of the train out of Van Buren, it served but seven miles in Arkansas, out of a total run in Arkansas and Oklahoma of approximately 83 miles, whereas this other train on the Calvit-Eudora Branch serves in Arkansas, eight miles out of a total run of 37.

Q. Have you ever given any thought to the extent to which these, and any other discrepancies that you may know of as to mileage, growing out of the different methods you have adopted in making your figures, and those adopted in making up the figures in exhibit 26, would have upon the value of your figures, for the purpose of showing the comparative cost as between local and through

3758 trains, and state and interstate business?

A. You say these and any other discrepancies in mileage between my basis, and the basis on which exhibit 26 is compiled; I think we all agree there was one discrepancy in one instance, that is the fractional hauls in short hauls, where we might pick up or drop the fractional mileage, where the railroad company would figure straight away mileage between billing points.

Q. There may be cases in which a shipment might pass to a station where there was a switch engine kept like at Diaz, or such a case as I put to you at Little Rock. The wheel reports would show that the car was dropped at that station, and was put at one point, and the switch engine might put it a mile away; it might have been dropped at Little Rock at the Ft. Smith crossing, and the switch engine might have taken it to East Little Rock, and there it might have been taken up by the Valley train; the wheel reports would only show where it was dropped, and where it was picked up again; the railroad's mileage would be based upon the distance from the point of origin to the destination, and would take in all those intervals that might be covered by the switching?

A. Yes, sir, your proposition is just this, that one train would take the car into one portion of the yard in Little Rock terminals, and another train would take it out of another portion.

3759 Q. My question is, whether those discrepancies growing out of those matters, in your judgment, would materially affect the relation between local and through business as worked up by you and by the compilations shown by exhibit 26.

A. In the case of the Little Rock terminal, where a portion of the haul would be by a switch engine between extremities of the yard, and between the yards in the terminal, there would be no distinction in th manner in which interstate and state freight would be handled. A car from Van Buren to McGehee, would get the same service as a car from St. Louis or New Orleans.

Q. I will confine it to cars in trains, the handling of cars in trains, the mileage you attributed to the cars?

A. We figured the mileage for the distance the train hauled the car; I don't see just what you are comparing it with; I thought I did in the first instance.

Q. Let me state it fully. Your figures relate alone to local trains?

A. Yes, sir.

Q. And if they are based upon one theory or one method of investigation, which would include in your mileage a mile here or exclude a mile there, and fourteen miles here and seven mils there, which is not included in the ton mileage represented in the total column of your exhibit I, wouldn't it have a material effect
3760 upon the result you reached by deducting your local performance from the total figures based on exhibit 26?

A. I don't see where these differences would come in; I saw your illustration of the Little Rock terminal, and I think I can answer you on that proposition; I think the illustration I gave you would serve very well.

Take a car from Van Buren to McGehee say; the mileage from Van Buren to Little Rock is 150 miles,—that is about the figure—the mileage from Little Rock to McGehee is 102 miles, but one mileage is figured from Van Buren into Argenta, and the second mileage is figured from East Little Rock to McGehee, and we will assume as your illustration did, that there is a distance between those two points which is switch engine mileage. As I see it, Mr. Roth's figures of mileage, represented in Exhibit 26, would be the straight mileage from Van Buren to McGehee, overhead, whereas, if we had that car in a train from Van Buren to Argenta, and in a second train from East Little Rock to McGehee, say a mile would be lacking in our figure; that comes under the head of fractional miles we would drop or pick up as I stated before.

I don't think that in itself, would make any appreciable difference in the figures compiled; I would like to see or apply to the individual movements and work it out, before I expressed any
3761 opinion; it is a small matter, and in a statement of this size, wouldn't have a great weight.

Q. You are dealing in ton miles?

A. Yes, sir.

Q. You obtained the total ton miles shown in your total column from exhibit 26?

A. Yes, sir.

Q. You obtained the ton miles in column one in the way you have described?

A. Yes, sir.

Q. Can you make a comparison in that way, can you arrive at correct results, by deducting the local performances from the total, for the purpose of ascertaining the ton miles, unless the mileage is ascertained in both ways on each column—on the two columns?

A. You mean ascertaining them the same way in both columns?

Q. Yes.

A. You would have to analyze the differences and reduce them to figures and see whether they would affect the percentages in which the ton miles were expressed, in order to give an intelligent answer to that. Those are give and take propositions, and I doubt extremely if there would be any material difference in percentages shown here when you got through.

Q. Suppose there was a material difference in the percentages, what effect would it have on the result?

3762 A. It would affect the result just as it affected the percentages.

Q. It is a fact, isn't it, that Little Rock handled more state freight in and out, than any other station in Arkansas?

A. That is a question I cannot answer; I assume that is so; it is a pretty big town; I don't know about that.

Q. It is a commercial center of the state?

A. Yes, sir, I think so.

Q. What would be your view about that, as to the quantity of freight handled?

A. I should imagine Little Rock would handle the bulk of the business, if it was properly favored in the matter of rates, and can get into its own territory, and if Memphis and Fort Smith don't cut it out.

Q. I want to ask you if your figures and methods you have adopted in ascertaining the mileage, is not short from one to three miles on all state freight that is handled in and out of Little Rock, as compared with the mileage shown on the records from which exhibit 26 was compiled?

A. There will be a difference which we have discussed at great length, on business handled through Little Rock, but I don't see how there could be any difference on business originating or terminating in Little Rock.

Q. Let me illustrate; take a shipment billed from Newport to Little Rock; that is the way it would be charged so far as

3763 the mileage is concerned on the records of the railroad company, on the records from which exhibit 26 is made up, to the station of Little Rock, and I understood from your statement yesterday, if it should be dropped in Argenta yards, at Baring Cross or Ft. Smith crossing, that you would charge the mileage to the point where it was dropped?

That illustrates what might be the difference, and the same thing can work the other way too, perhaps.

A. It is the mileage between your yards and your freight house, as I see it; I would have to know that the Company added that and figured its mileage to the freight house in making its statistics, but assuming that to be correct, there would be this difference between the company's statistics and our train figures, that is, the mileage from the yard at which the train was set out, over to the freight house, necessarily, because we do not have any train movement from the yard to the freight house; you would have to have a lot of that stuff to make a dent in 120,000,000 ton miles.

Q. Mr. Hillman testified that in the absence of actual gross

weights, he would take the percentage of car miles in each class of trains, that is local and through, and the percentage of train miles and add them together, and divide them by two, for the purpose of ascertaining the gross weight; he says that would give you a percentage which each represented—I mean the dead weight—
3764 strike out gross weight—I want to ask you if you pursued that method?

A. I think our exhibit K in the Iron Mountain case, states we used the car mile as a basis for the division of expenses; Mr. Hillman was referring to; we did not pursue that method; we used the car miles.

Mr. HILL:

Q. What was that, maintenance of way or maintenance of equipment?

A. Maintenance of way, I think; our Exhibit K shows that we used car miles, after applying a certain arbitrary to the engine miles to make them a car mile equivalent.

Mr. MOORE:

Q. Have you ever figured the difference, either in per cents or any other way, that you have allowed under the methods pursued in making up the exhibits filed by the state in this case, in favor of local trains, on account of the increased expense of operating that class of train over the through trains; I know you have made a 50% allowance here and a 50% allowance there on certain accounts, maintenance of way and some things, and maintenance of equipment and other matters, but have you given any thought to and can you state to me, either the actual or approximately what the difference is, we will say in per cents, or if you can express it in any other way that would express it better, what difference there is, and what allowance you have made, total allowance, in favor
3765 of local trains, on account of the increased expense in operating them?

A. You say in favor of local trains—you mean a charge against local trains?

Q. Well, against, then.

A. It is necessary in order to do that, to see what our arbitrary addition, in each class of expenses where an arbitrary addition was made, figured out in dollars and cents would be; that is, to make figures without the arbitraries and then with them, and then that would express it to you.

Q. Have you ever done that?

A. No, sir.

Q. Are you prepared to state what allowance or charge, if you express it in those terms, has been made against local trains, on account of the increased expense?

A. Any answer to that would be the result of calculation such as I have just described, and I have not made that calculation; anybody can make it from the basic data given in these exhibits.

Q. I will ask you further, have you any idea—any approximate

idea—of the difference if any, that has been made as to the expense of conducting state over interstate business, in the methods adopted in the exhibits filed in this case?

A. Do you mean what our results are in working out the extra cost per ton per mile on state and interstate business?

3766 Q. Yes.

A. I perfer to make that figure and give it to you this afternoon.

Q. Can you work it out there just in a minute?

A. No, sir, it takes some calculations, and I want to prove the figures carefully.

Q. I believe you were going to figure out the cost per ton mile?

A. As I understood your question, it was the cost per ton mile, as per our exhibits, for local and through trains?

Q. Yes.

A. Exhibit J shows in column one, line six, under the head of train cost, total train cost for local trains, as we have arrived at them, using the various bases set forth in Exhibit K, which is an explanatory exhibit. Dividing that figure of $644,008.78 by the total ton mileage of revenue freight of local trains shown on Exhibit I, which is 13,470,970, we find the local train costs per ton per mile to be 4.781 mills; taking the total train costs for through trains, shown in column two of Exhibit J, line six, namely,

3767 $1,948,289.55, and dividing it by the total ton miles of revenue freight on through train shown on Exhibit I, 107,050,490, we get an average cost per ton per mile for through trains of 1.820 mills; the excess of the local train costs over the through train costs per ton per mile, is expressed in percentages, 162.67%.

Q. That is the difference in cost per ton per mile without any discrimination as between classes of freight?

A. That is the average for train costs only.

Q. What is the difference in the cost per train mile as between the local and the through trains?

A. That was not in your question this morning; I will have to figure that. Dividing the train costs shown on exhibit J under the heads of local and through by six times the local and through train miles shown on exhibit I, in order to get a six months figure, I find the average cost per train mile on local trains to be $1.52; on the through trains, $1.65.

Q. If you want to ascertain the increase in the state revenue provided by the railroad tariff of November, 1908, as compared with the Arkansas Commission tariff, what method would you pursue?

A. You are talking now of revenue derived from traffic, not rates published in the tariff; the concrete result of moving the traffic under those two sets of rates?

3768 Q. Yes.

A. As the Commission's distance tariff is entirely on a mileage scale, the comparison would have to be on that basis; you would have to take the actual movements under the railroads voluntary rates, and apply to these actual movements, waybill by way-

bill, shipment by shipment, the rate for that distance on that commodity which would apply under the Commission tariff, and in that way, get a comparison; that is the only comparison there could be.

Q. That is the only way in which it could be ascertained?

A. If you desire to compare the result of applying the standard distance tariff which has been enjoined to the traffic moving under the railroads tariff from November, 1908, the comparison would necessarily be shipment by shipment, rate by rate.

Q. You would have to compare the new tariff to the business for the last half of 1907?

A. You asked me to compare two tariffs in the abstract?

Q. I am speaking now concretely, with reference to this case; therefore, if you want to apply the railroad November tariff to the business that was done in the last half of the year, 1907, you would do it in the way you have stated, by applying it to the business that moved during that period?

A. It could be done in that way, yes, sir, but if you were endeavoring to ascertain the average revenue per ton per mile or the two periods, of course, there would necessarily be the assumption
3769 that the various commodities moved in relatively the same volume, in the last half of 1907, as they did during the period which you were comparing, but you have not said yet, which period you want it compared with.

Q. What I am speaking of, is how you would ascertain the increase of revenue from the same business which was moved in the latter half of 1907, under the latter schedule of rates?

A. If you wanted to know what the rates under standard distance tariff would be an any commodity, or the revenue derived from moving any commodity under that tariff, you would have to apply the rates of that tariff to it.

Q. There have been some other methods suggested and I wanted to see what yours would be.

That is all, Judge Hill.

3770 Redirect examination, Mr. T. A. HAMILTON.

By Mr. HILL:

Q. Some question was raised as to your salary when you were working for the Iron Mountain road; if you have no objection, I would like for you to state what your present salary is, with Haskins & Sells?

A. They are paying me this year $3,000.

Q. Referring to these work sheets that you turned over to the Iron Mountain, representing the work on the October movement, some questions were asked you, seeming to imply that you had not carried forward memoranda that you should have carried forward.

I will ask you what was the purpose you had in making up those sheets; were you doing that for the Iron Mountain or whom were you doing it for?

A. My instructions were to secure, for the information of the

state's attorneys in this matter, the ton mileage performance of local freight trains on the Iron Mountain, to do it as expeditiously and as economically and as accurately as I could. I had no other object in view, than the accomplishment of that purpose.

Q. In making up these work sheets, you didn't do it with
3771 the expectation of turning them over to the Iron Mountain at all—that was not the purpose?

A. No, sir, they were compiled for the use of the attorneys for the state, subject to their disposition.

Q. You turned them over to them subsequently as a mere matter of helping them in their work?

A. Yes, sir.

Q. Mr. Moore asked you, as I understood him, about the excess costs of the local over the through trains; have you also the excess costs as shown, of the state over the interstate?

A. For the Iron Mountain?

Q. Yes, as shown in your October movement, the same as Mr. Moore questioned you about?

A. The figures for which Mr. Moore asked, and to which you refer, were the excess cost per ton per mile of all business on local trains over all business on through trains, and I gave him a figure based on the train costs shown in columns one and two, line six, of exhibit J, divided by the total ton miles of each class of train, as shown in Exhibit I.

Q. That didn't show anything but the train costs, didn't show the maintenance of way and equipment, did it?

A. Yes, sir, it showed everything but traffic expenses, station expenses, loss and damage freight, supervision and general, accruing to the directly allocated portions of transportation expense; the portion of general expense following those previously allocated; those were not train costs, they were divided directly between state
3772 and interstate.

Q. This 162 I believe it was you gave Mr. Moore represented all the train costs and everything except the matters you have just mentioned?

A. It represented the division by the total ton miles on each class of trains, of the figures shown in columns one, and two, line six, exhibit J.

Q. Making it in round numbers about three to one.

A. It was 162.70%, as I recall it, excess.

Q. Give the statement between state and interstate.

A. The excess cost of state over interstate business per ton per mile is 68.11%.

Q. That takes in everything?

A. That takes in all the costs of state and interstate business, as represented by the figures in columns 3 and 4, of exhibit J, shown on line 8, total cost of intra and interstate business, divided by the interstate and intrastate ton miles, shown on exhibit I.

Q. These are all referring to freight, of course?

A. Yes, sir.

Q. Now, give the excess revenue of state over the interstate?

A. The figures which I have given, as I have explained, were based on these six months exhibits, but using the October ton miles.

Q. That was the same basis you gave Mr. Moore yesterday?

A. Yes, sir.

(Two preceding questions and answers read, at the request
3773 of Mr. Moore.)

Mr. HILL:

Q. Is that answer right?

A. Yes, sir, as to what I have done; that is the basis on which I made the figures for Mr. Moore yesterday; in talking of train costs, it may make some slight difference if I took the six months ton miles, figured on the basis of the six months ton miles, the excess cost of intra over interstate business per ton per mile, considering all costs shown in Exhibit J, is 86.9%.

Q. And figured the other way?

A. My figure was in error, I applying only the month's ton miles to the six months' expenses.

Q. Give us the revenue.

A. Exhibit 5 shows the average revenue per ton per mile for the six months period from state business to have been 13.377 mills per ton per mile, and from interstate business, 6.75 mills per ton per mile; the excess of the intra over the interstate, expressed in percentages, is 98.18%.

Q. In round numbers, 98% more revenue and 86% more expenses of the state over the interstate?

A. Yes, sir.

Q. Now on this lap-over proposition that you explained in your cross-examination of one month's business on the other on your October train movement; you explained fully, as I understand, why you thought one would equalize the other; did you have any statistics in mind to bear out that figure?

3774 A. Yes, sir, the Cotton Belt figures.

Q. I wish you would give those?

A. Exhibits 19 and 20, which cover the test made under Mr. Kimbell's direction, show the ton miles of intrastate freight transported as developed by Mr. Kimbell's men riding the trains, to have been 1,381,303, and the ton miles of interstate freight ascertained in the same way, that is the actual movement, to have been 29,087,265; of the total movement as ascertained by Mr. Kimbell's men on the trains, the intrastate was 4.534%, the interstate 95.466%.

The company's statistics which I understand are on the same basis as Mr. Roth's exhibit 26, regularly compiled for the purpose of their own information, show that during the same month, Oct. 1908, the ton miles of intrastate freight were 1,372,093, and of interstate freight, 28,952,919.

The percentage which the intrastate freight ton miles taken from the company's regular statistics, compiled on the same basis, I understand as exhibit 26, was of the total ton mileage so compiled, 4.525%, and the interstate freight was 95.475%.

If those percentages had been handled in the way we ordinarily

handle them, and in the way which we have handled them in our statistics here, running them out but two places—when I say statistics, I mean exhibits we have filed in the case—running them out two places, the percentage figures would have been identical
3775 in each case for the actual movement, and the movement as shown by the company's statistics, as they are shown on this memorandum I have here, the difference is nine one thousandths of one per cent.

Q. How many decimals do you have to carry forward to find the difference?

A. Three decimal places.

Q. That represents the lap over on the Cotton Belt?

A. That would indicate that he actual lap over took care of itself, as I suggested in my cross-examination.

Q. With the exception of how many thousandths?

A. 9 one thousandths of one per cent.

Q. I wish you would attach that as an exhibit?

A. Same is hereto attached and marked for identification as exhibit "E-1" and is as follows:

For Exhibit "E-1," see Volume 9, page 5857.

3776 Mr. MOORE:

Q. Do you understand that the figures on these two roads, the Cotton Belt and Iron Mountain, are compiled on the same basis?

A. I understand they are compiled from the waybills as they are in the case of the Missouri-Pacific statistics; I feel quite safe in the assertion that they are not compiled for the auditor's ordinary purposes by riding the trains.

Q. What I want to get at is if one is not on the received basis in all accounts, and the other the forwarding basis in all accounts, and if there would not be a difference resulting from the use of those two bases?

A. That might develope, I am not prepared to say now. I am quite sure that the company's regular statistics are not compiled by riding the trains.

Mr. HILL:

Q. Speaking further of this lap over, if there were any differences in that, would they affect any of the other statistics shown on the other exhibits, other than the ton miles between state and interstate?

A. I take it you refer to exhibit I, which gives all our statistics in the case of the Iron Mountain.

Any lap over of ton mileage or any discrepancy between the basis on which the ton mileage shown in exhibit 26 and those shown on exhibit I were compiled, would affect nothing but the ton mileage, and the dependent percentages of the car miles, caboose
3777 miles, etc., there would be no lap over; that is the actual movement during the month, caboose miles, cars and engine miles.

Q. The lap over that has been gone into at great length, only goes to the ton mile statistics you finally use, and would be erroneous only to that extent, but not to the preceding bases used?

A. Not to the other statistics used in Exhibit I; it is a ton mile proposition pure and simple.

Recross-examination.

By Mr. MOORE:

Q. The car mileage every month would depend, I suppose, wouldn't it, upon the amount of traffic handled during the month?

A. I think that would be a fair assumption.

Q. If there was a large amount of traffic handled one month, and a small amount in another month, probably the car mileage would be changed?

A. Yes, sir, I don't suppose they would haul their cars around for amusement; I suppose they would let them stand idle, that would be cheaper than to haul them around.

Q. On what basis, do you understand the records kept by the Iron Mountain Ry. Co. of freights handled and upon which Exhibit 26 is based, is made up.

3778 A. I think we went over that before; I can give you that information as I recall it.

Q. What I mean, and I will call your attention directly to it, is the record of freights that are received as distinguished from freights forwarded by the railroad company?

A. It is partly a forwarding and partly a receiving proposition as I understand it.

Q. Just explain that fully?

A. It is a forwarding proposition in this, that the Iron Mountain takes into its accounts, and into its statistics, all waybills made during the month at stations on the Iron Mountain-Missouri-Pacific system; it also takes into account waybills made on other roads, perhaps, in preceding months, receiving during the current month; all waybills received from connecting lines; they may be dated in the current month or preceding month; it takes in all its forwarding business, and such business as received from connecting lines during the month.

Q. How does it treat business originating on another line, passing over its rails in the State of Arkansas, delivered to another line and delivered to its destination?

A. Where the Iron Mountain is intermediate carrier?

Q. Yes?

A. Without reference to the memoranda I have made, I couldn't say whether that settlement is made before the delivery is effected by the ultimate carrier or not, or whether it is carried by the Iron Mountain as freight in transit, on the basis of the propor-

3779 tion they expect to receive for their haul in the ultimate settlement; I think the latter method is the one pursued.

Q. If the entry on the record is based on the settlement, then it would appear of the date that the last carrier, that is the con-

necting carrier, to whom the goods was delivered by the Iron Mountain Road would make its settlement with the Iron Mountain road?

A. Yes, sir, I recall that Mr. Roth stated that he took such intermediate business from company's in transit sheets, and I infer from that, that such intransit business is in his exhibit 26, his memorandum states that fact, as I recall it.

Q. Do you mean that Mr. Roth's memorandum states that his entry on the accounts and on the records of the railroad company before the settlement is made by the last connecting carrier?

A. Mr. Roth's memorandum states he took that business from the company's in transit sheets, that is the only solution I can see.

Q. What do you understand that to mean?

A. Just as I have stated.

Q. You haven't said it in a way that is intelligible to me; at what period, with reference to the shipment itself, from the time it originated until the time it was finally delivered at destination; would that be entered on the accounts of the railroad company?

3780 A. It would be the period in which it passed over Iron Mountain rails, that would take it into the Iron Mountain's accounts, regardless of when it was billed or delivered.

Q. Didn't you have yesterday, a copy of the statement that Mr. Roth furnished you?

A. Yes, sir, I referred to it just now; it is up stairs, I can get it in a minute.

Q. I wish you would do so? Just read whatever you have there.

A. Mr. Roth gives the basis or the source of his information in this manner: "System business from the company's journals interline received from company's B. report; interline forwarded from connecting lines abstracts and our October in transit sheets; interline intermediate from connecting line abstracts."

I see from his fourth statement, that that is settled or taken into the company's accounts as settled for, by connecting lines.

Q. Your impression was erroneous about that?

A. Yes, sir, I recalled the reference to in transit sheets.

Q. Do you know what system is in vogue on the Cotton Belt system?

A. No, sir, not in that detail; they have abandoned the antequated freight journal system, which is still in vogue on the Iron Mountain, and are checking one agent against the other.

Q. In order to avoid any misunderstanding about the effect of your testimony, I want to call your attention to my under-

3781 standing of your statement in answer to my question yesterday, as to the relative costs per train mile of local and through trains; I understood you to state yesterday that the cost per train mile per mile of the through train was $1.65 and for the local train, $1.52, was that correct?

A. We made these figures here yesterday and proved them at the time, and the record will show the cost per train mile was the result of dividing the train mile into the total cost; there is no analogy between the figures yesterday and those today.

Q. What I intended to ask you was if you intended to modify that statement?

A. This refers to ton miles and the other to train miles.

Q. I am just asking you to avoid any confusion about the matter.

A. There is no relation—one is the train unit and the other is the ton unit.

Q. You still adhere to the statement made yesterday as to the train costs between local and through trains?

A. Those were the average train costs between local and through trains; I think those figures were right; that was the result of dividing train miles into train costs—not the ton miles.

Q. How long would it have taken the accountants of the railroad company to have checked the figures prepared by you and used by you in your exhibits in this case, without your

3782 work sheets?

A. We couldn't have gotten any figures unless we had assembled them on the work sheets.

Q. What I mean is, if you had not furnished the railroad company with your work sheets, had simply put the figures that appeared upon the sheet upon the page containing the results of your figures last February and March, how long would it have taken them to go over and check those, without the aid of the work sheets?

A. By working with an average of four assistants, we put those figures together in a little over four months; had the railroad put as large a force and as equally competent one, as I fortunately had to assist me, it seems to me they should have accomplished it in at least the same time, perhaps shorter; we were not familiar with the records when we started in,—that is not familiar with the present system of filing, things of that kind, although we had first hand knowledge of Iron Mountain conditions, Mr. Wright and myself, it dated back a little, and we had to familiarize ourselves with the road to a certain extent; it seems to me, that a group of men taken from the company's present employees, should have done the work as quickly.

Q. Didn't the railroad accountants furnish you with their data and everything they used in their work in making up their accounts?

A. Mr. Johnson gave us access to all their figures.

3783 Q. Didn't you expect in making up those sheets, that the railroad accountants would want them and you would let them have them?

A. I prepared them subject to the disposition made of them by counsel for the state; I had no voice in the matter.

Q. Didn't you at that time contemplate and expect they would be called for and that the accountants of the railroad company would be allowed to use them for the purpose of tracing and checking your work?

A. It appeared to me, if they desired to check our figures, having declined or neglected the opportunity to join in a joint compilation, that they might have wanted to check them.

Witness excused.

It is agreed between the counsel, that Mr. Hamilton may be examined in re-direct examination, in regard to the matters that were brought out on cross-examination, touching the October car movement in the time to be used by the plaintiff in rebuttal.

3784 T. F. WHARTON, being called on behalf of defendants, testified as follows:

Direct examination.

By Mr. HILL:

Q. Have you prepared some statistics based on the Interstate Commerce reports, as to the increased efficiency in train performances, tons accomplished, etc.?

A. Yes, sir.

Q. I wish you would state what you have, and introduce it as an exhibit?

A. Same is hereto attached and marked for identification as Exhibit "F-1" and is as follows:

For Exhibit "F-1", see Volume 9, page 5859.

3785 A. This is an exhibit of freight and passenger statistics, covering a period of ten years, ending with the year ending June 30, 1907, for the entire United States, for the Interstate Commerce Commission Group 8, for the St. Louis, Iron Mountain & Southern and the St. Louis Southwestern Ry. Companies.

It shows in the first column the ton miles of freight carried; these are expressed in millions, the first figure representing 95 billion, 139 million. As to the ton miles carried in the United States, this indicates an increase of 148.7% in ten years; that is the increase of the year ending June 30, 1907, over the year ending June 30, 1897.

The ton miles carried in group 8, show an increase of 174.8% in the ten years period.

On the St. Louis, Iron Mountain & Southern, there is an increase of 139.1% in the ton miles in the ten years.

And on the St. Louis, Southwestern, an increase of 117.1%.

The second column gives the freight train miles in millions; the first figure represe-ing 464 millions. Down under Iron Mountain & Southern, we have had to express that in fractions, the fraction meaning 4 millions 400 thousand, compared with six million, four hundred thousand in 1907.

3786 The same is true of the Cotton Belt, the freight train mileage would be expressed as 1 million 2 hundred thousand, and one million, four hundred thousand.

These figures indicate an increase in the train mileage which hauled the ton miles of freight just referred to, of 35.5% in ten years in the United States, 46.7% in ten years in group 8, and 36.2% on the Iron Mountain, and 14.3% on the St. Louis Southwestern.

The third column, gives the average train load in tons, and indi-

cates an increase in the average loading of trains of 75% in the ten years, in the United States; of 75.3% in group 8; of 75.6% on the Iron Mountain & Southern, and 83.7% on the St. Louis, Southwestern.

The statistics used in the third column are those for the United States and group 8, as shown by the Interstate Commerce Commission report. We have not divided ourselves, the train miles into ton miles to get that figure, but have taken the Interstate Commerce Commission figure itself; in the case of the St. Louis, Iron Mountain & Southern and St. Louis, Southwestern, we made those figures by dividing the train miles into ton miles into ton miles carried.

Q. You are setting up by your own calculation on these two roads, that calculation made by the Interstate Commerce Commission comparisons in the United States and group 8?

A. Yes, sir, the Interstate Commerce Commission does not give the average train load on each road, but only for the
3787 United States and each group.

The 4th column gives the average receipts per ton mile in cents. I think those receipts explain themselves. They have practically remained stationary, during the entire period, the changes being very small; I might say the percentage at the bottom of the 4th column, means seven ten thousandths of one percent, the way it is entered there.

In the 5th column, is given the number of passengers carried one mile in billions, the first figure for instance, representing 12 billions, 256 millions.

The passenger figures indicate an increase in ten years in passenger miles for the United States of 126.1%; for group 8, of 252%; on the St. Louis, Iron Mountain & Southern, 154.2%, and of the St. Louis, Southwestern 172.6%.

The sixth column shows the passenger train mileage in millions, the first figure for instance, representing 335 millions, and the first figure under the head of expenses for instance, representing seven hundred thousand, the decimal point indicating that these figures for passenger train mileage, show an increase in this mileage in the United States of 51.9% in the ten years; under group 8, 100/7%; on the St. Louis, Iron Mountain & Southern, 71.4%, and of the St. Louis, Southwestern Ry. Co., 71.4%.

3788 The seventh column shows the number of passengers per train mile; that indicated for the United States an increase of 37.8% in the passengers carried per train mile; under group 8, of 61.5%; on the St. Louis, Iron Mountain & Southern, of 44.4%, and on the St. Louis Southwestern, of 57.5%.

The figures in the last column, are average receipts from passenger per mile in cents; these show but slight variation in rate during the period.

Q. Does that complete the explanation of it?

A. Yes, sir.

Q. Make that an exhibit to your testimony.

A. I do so, and same is marked for identification as Exhibit "F-1", and is as follows:

For Exhibit "F-1", see Volume —, page —.

3789 Q. Have you read the opinion of Judge Farrington, in the case of Southern Pacific v. Bartine, 170 Federal Reporter, and studied the formula that he has adopted there for working out the division between state and interstate?

A. Yes, sir.

Q. Have you prepared an exhibit using Judge Farrington's formula as applied to the statistics in this case?

A. Yes, sir.

Q. I wish you would explain it and introduce it as an exhibit.

A. There will be two, one for the Iron Mountain and one for the Cotton Belt, which are marked for identification as Exhibit "G-1" for the Iron Mountain and Exhibit "H-1" for the Cotton Belt, and are as follows:

For Exhibit "G-1", see Volume 9, page 5861.
For Exhibit "H-1", see Volume 9, page 5863.

3790 Q. Explain how you made the exhibit?

A. Both exhibits are made in exactly the same manner, one for the St. Louis, Southwestern and one for the Iron Mountain, and both cover six months, ending Dec. 31, 1907.

Judge Farrington, as I understand the case, only passed on the question of freight rates and freight expenses, and in compiling his figures, used the ton mile basis, assuming that the transportation expenses would be three times as much per ton per mile for the state business as for the interstate, and that on all other expenses, the cost would be the same per ton per mile; these figures have been compiled on that basis, using the Iron Mountain and the Cotton Belt ton miles and classification of expenses.

Q. The formula will show for itself; state what is the return on the property if Judge Farrington's formula was applied to the Iron Mountain statistics in this case?

A. Assuming that the passenger business netted the same earnings on interstate business, the return on the property of the Iron Mountain would be 7.37%, and on the St. Louis S. W. would be 11.42%.

Q. That is on all business?

A. Yes, sir, all intrastate business in Arkansas.

Q. Have you had prepared a copy of the original affidavit of Mr. E. K. Vorhees, filed on the application for a modification of the injunction?

3791 A. Yes, sir.

Q. I wish you would attach a prepared copy of that as an exhibit?

A. I will do so, and same is marked for identification as exhibit "I-1":

For Exhibit "I-1", see Volume 9, page 5865.

It is agreed: That the record will not be encumbered by copying the Vorhees' affidavit, as each side have their respective copies, and only one will be filed to take the place of the original.

Cross-examination.

By Mr. MOORE:

Q. How do you account for the falling off in the receipts per ton per mile during the period covered by your exhibit of freight and passenger statistics compiled from the reports of the Interstate Commerce Commission, at the same time that the business seems to have increased throughout the country?

A. Well, I don't account for it particularly, except that the original rating is this rate; I don't believe that would be affected by any great increase or decreased rate, the average rate per ton per mile.

Q. Wouldn't you think that the universal adoption of low state rates by state commissions and state authorities, would bring down those receipts in that way?

A. If the rates were universally reduced that might be possible, but it would effect it only slightly.

3792 Q. In the United States there is a reduction of 4.9% dur- the ten years?

A. Yes, sir.

Mr. HILL: I object to that;; Mr. Wharton has only put in evidence the facts; what his views are about them I don't know; I don't know whether he is qualified to handle those propositions or not.

Q. On group 8, there is a falling off of 9-½% in the ten years in the receipts per ton miles?

A. 10½%.

Mr. HILL: I want to put in copy of the deposition of Mr. J. M. Johnson, in the case of Chapman & Dewey, Lbr. Co. v. Jonesboro, Lake City & Eastern Railroad.

It is agreed that same may be introduced, subject to objection for incompetency, and that same will be filed to take the place of the original, and not copied.

(For testimony of J. M. Johnson see page 3793, this record.)

Mr. HILL: I want to put into the record all the original affidavits used before Judge Vandeventer; they may be part of the record, I don't know whether they would or not; I want to make an offer of introducing the original affidavits; if they are not already a part of the record we want to introduce them and offer them in proper time.

For affidavits see pages 133 to 451.

3793 In the Circuit Court of Craighead County, Jonesboro District.

CHAPMAN & DEWEY LUMBER COMPANY, Plaintiff,
vs.
JONESBORO, LAKE CITY & EASTERN RAILROAD COMPANY, Defendant.

J. M. JOHNSON (Vice-President in charge of Traffic of the Missouri Pacific & St. Louis, Iron Mountain & Southern Railways) first having been duly sworn, testifies as follows, on behalf of the Defendant:

Direct examination by Mr. J. C. HAWTHORNE:

Q. State your name, age, residence and occupation?

A. J. M. Johnson, age 64 years, residence St. Louis, Mo., occupation Vice-President in charge of Traffic of the Missouri Pacific Railway Co.

Q. How long have you been engaged in the traffic department of railroads in this country?

A. Thirty eight years.

Q. Have your duties caused you to come in contact with the earning capacity of Railroads generally?

A. Yes.

Q. Are you acquainted with the physical condition of the Jonesboro, Lake City & Eastern Railroad Company?

A. Well, only in a very general way.

Q. That road is eighty three miles long; it has a terminal at Barfield on the Mississippi River and a branch that runs to Osceola on the Mississippi River, and the two branches connect at Osceola Junction and lead to Jonesboro. The branch and main line make
3794 up eighty three miles of road. Are you familiar with the costs of operating railroads generally, Mr. Johnson?

A. No, I cannot say that I am. I am not an operating official. I am a traffic man.

Q. Take it that on a road eighty three miles in length eighty per cent of its tonnage is forrest products, would a two cent rate on rough lumber be compensatory for a haul of one to twenty miles?

A. I should say not.

Q. Are you familiar with the tariff formulated by the Arkansas Railroad Commission, known as Standard Distance Tariff No. 3, as applied to the Jonesboro, Lake City & Eastern Railroad Company?

A. I am familiar in a general way with the tariff of the Arkansas Railroad Commission establishing the rates on rough material. I could not name the rates for the different distances, but am familiar with the tariff in a general way.

Q. I hand you what purports to be a copy of the tariff put in effect in April 1st, 1907 and in 1908 made to apply on the line of the Defendant Railway Company, being a rate on rough material in addition to shipment of percentages of that material out, the percentages varying according to manufacture of the rough material, this copy being embodied in the complaint of the Plaintiff.

A. So then this is a correct copy?

Q. I would like for you to examine that tariff sheet and state whether in your opinion as a railroad traffic man the rate of two cents would be compensatory on the shipment of lumber from points on the Jonesboro, Lake City and Eastern Railroad to Jones-
3795 boro, or other Junction Points, a haul of fifty miles and under?

A. It would not. The rates established by the Arkansas Commission as applicable upon so called rough material from the point of origin to the manufacturing point were made to be applied in connection with an outbound movement of the product. The rates of themselves into the milling points are not considered compensatory. In fact, they are very much less than the cost of transportation, but are made in connection with an outbound haul, under which the carrier receives a long haul and reasonable rate, so that the rate in the aggregate from point of shipment of the rough material to the destination of the product, considering the stock, is considered fair and reasonable.

Q. When there is an outbound rate of only two cents per hundred pounds on the product of the rough material, would that be compensatory to the road moving both the rough material and the outbound product?

A. It certainly would not. That would only mean a rate of four cents in the aggregate, including a stop, which would mean from two to four terminal movements, which, of course, could not be performed in connection with the haul at that rate with any degree of profit.

Q. Are you familiar enough to say whether a company so situated would sustain a loss if they undertook to move tonnage at those rates, two cents and two cents out on the product, forty per cent of the rough material?

A. Well, it depends of course somewhat on the service performed on the outbound haul.

Q. I mean would the rates be compensatory in the aggregate?

3796 A. Well, as I said, you are receiving two cents for an inbound movement, fifty miles or less. I stated that that rate is not compensatory. Now, in taking up a movement, outbound, we must consider the distance and service performed on the inbound movement. If the inbound movement is of considerable distance, for which you receive only two cents, why I should say it is not compensatory.

If you take the freight, the inbound and outbound, in the aggregate, the finished product only amounting to forty per cent of the rought material, the rate then for hauling in and out would be 2 1/8c. per hundred on the two hauls. Would that be compensatory?

A. I understand the question to be this: would a rate of two cents per hundred on the rough material in from distances fifty miles and less plus a rate of two cents on forty per cent of the inbound

tonnage be compensatory for the single haul of the rough material in? Is that right?

Q. Yes.

A. That would give you a rate of 2 6/10 in the aggregate for the service performed. I should say that would not be compensatory. Now, I want to say in connection with that that the Arkansas Railroad Commission has established rates for the transportation of lumber and lumber products between points in Arkansas. The rates established by the Commission are assumed to be fair and reasonable compensation for the service rendered. Anything less than those rates are not considered fair and reasonable nor compensatory, so this rate, being very much less than the rate
3797 established by the Commission, I should say was not a fair rate for the service.

Q. You understand, Mr. Johnson, I judge you take into consideration in making that answer that they have established a lumber rate of five cents for fifty miles and under and the two cent rate, which you have read in the tariff handed you was conditioned upon an outbound shipment over the same line of forty per cent of manufactured product. When you speak of the rate being less than the reasonable rate the Commission fixed (or one presumed to be reasonable), do you refer to the local rate of five cents on lumber?

A. I refer to the regular scale, which has been established by the Railroad Commission of Arkansas. I do not know whether it is five cents or not. I know that it is much higher than two and one eighth cents. The point I want to make is this. The Railroad Commission has established what it called lumber rates. They represent a rate for the movement of lumber and its products between points in Arkansas when the shipment originates at a given point and is sent to another point, that service being complete within itself. Those rates are separate and distinct from those rough material rates. They have no relation to rough material rates whatever. The Commission had no thought, so far as we are advised, of applying the rough material rates on a shipment which was complete within itself. They could only be used in connection with some subsequent movement upon which the Commission's rate would again be applied, that is, the rough material rates would be applied on the material coming into the milling point and when the shipment went out the Commission's rate applying on lumber and its products would be applied, so these are not rates
3798 of themselves. They are only rates representing part of a movement.

Q. If the line of road so physically situated that the rate applicable to the haul that it would make out of the outbound tonnage would bring a return of only two cents on the finished product you would say that that rate combined with the two cent rate in on rough material would not be compensatory for the movement of the rough material alone from point of shipment, or a distance of fifty miles and under, to the point of milling?

A. That is a state movement. There is no two cent rate on outbound movement under the Commission's tariff for Arkansas.

Q. The question is based upon the assumption that the proportion of revenue that the Jonesboro, Lake City & Eastern Railroad Company would get on the outward movement would be two cents on the finished product.

A. You could not get that under any tariff or tariff arrangement of the Arkansas Commission. I mean there is no tariff of the Arkansas Commission and there is no joint arrangement authorized by the Arkansas Commission that will give you as little as two cents. If you are going to apply the rough material rates in view of the outbound movement, that outbound movement must give you the lowest rate that the Commission makes. That may be their rate for fifty miles and less or it may be the proportion which would accrue to your line of a joint rate which is authorized by the Commission, and the joint rate authorized by the Commission represents about eighty five per cent of the local rates.

Q. Mr. Johnson, in your experience as a traffic and freight man, have you studied the cost of movement of the different classes
3799 of freight, different kinds of tonnage, in determining what would be reasonable rates in the handling of different classes of traffic, and are railroad rates not based on the assumption that they make fair return on cost of movement of that freight?

A. It is not very difficult to determine the cost of moving any particular commodity any particular distance. In fact, it might be said to be impossible to do it. We can only figure in a very general way. We know about what it costs to move a ton of freight one mile at the end of the year and we know what we have received for moving a ton one mile. Now, that is on the business as a whole, which, of course, is made up of hundred- of thousands of different shipments. It is impossible to know the exact cost of moving one ton of any particular class of freight for any particular distance.

Q. But in making the rates, is the general average of cost of moving a commodity taken into consideration in fixing a rate that will be compensatory in the moving of any particular commodity? I refer to the general average of cost you have spoken of as shown by your records at the end of the year.

A. No, rates are not made that way. By experience, we have some knowledge of about what we ought to have for the service in question. Rate making as a general proposition is largely a guess and the railroad people claim by experience they are very much better able to guess correctly than the other fellow. There are so very many factors entering into the cost that it is impossible to determine the cost of moving the different classes of freight, and we can only determine in a general way from experience about what is fair and compensatory.

3800 Q. Now when you say that a two cent rate for the hauling of rough material a distance of fifty miles and under is not compensatory, do you speak with reference to your general experience in freight matters through the period of years that you say you have been directly connected with the traffic departments of railroads?

A. I do. Let me explain there a little bit. A haul of that character represents in the first place a movement of the empty car from some point to the loading point. The car is switched into the train to be moved to the loading point, then it is set out at the loading point, then picked up again when loaded, then taken into point of destination and set out again. There are four terminal moves besides the haul. Those terminal moves are just the same whether the car moves fifty miles or whether it moves one hundred miles or two hundred miles, and those movements are really the expensive movements, especially in a large terminal. I do not know how expensive your terminals are at Jonesboro, but in a place like St. Louis or Little Rock we would figure on a terminal movement of that kind costing something like two dollars. There would be eight dollars right there for terminal movements so these short hauls, we figure, can not be performed at anything like the rate per ton per mile that we could perform a long haul.

Q. You have likewise, Mr. Johnson, entered into that the free time for loading and unloading those cars and the train expense, which is considered, of course, in all those items?

A. That is the time when the car is out of service, you might say?

3801 Q. It is just as long for a short haul as it is for a long haul?

A. Just the same.

Q. In other words, you mention the terminal moves, free time, etc., as some of the elements that enter into the item cost?

A. All of those.

Cross-examination by Mr. ALLEN HUGHES:

Q. I understand you to say, Mr. Johnson, that you cannot tell us what would make the actual cost for hauling a carload of lumber fifty miles, or a less distance, to Jonesboro. Am I correct about that?

A. I cannot tell what would be the actual cost of moving a carload of lumber to Jonesboro.

Q. You spoke of rates in force in Arkansas. If you have a Missouri Pacific or Iron Mountain tariff accessible that contains the rough material rates in force on that road, I would be glad to have you get it and let us know how those rates compare with these.

(It is agreed that the witness may read from these tariffs as if the tariffs themselves were placed in evidence.)

You have, Mr. Johnson, a tariff in Arkansas, something like the one set out in the complaint, with reference to which you have already testified, which pertains to rough material rates. That is the particular rate about which I desire you to speak now. The particular question I asked you with respect to that rate was: How does it compare with the rate on the Jonesboro, Lake City &

3802 Eastern Railroad about which you have spoken? How do your rough material rates compare with rough material rates on the Lake City Road, I mean rough material rates on lumber and

forest products? By this I mean the tariff in complaint now before you. You can assume that to be correct as both sides agree that it is.

A. I understand this is the tariff in effect today on the Jonesboro, Lake City & Eastern Railroad. It is somewhat different from the tariff we are using. Our tariff provides for rate of twenty five miles and under two cents, over twenty five miles and up to fifty miles two and one half cents, while the Lake City tariff provides for a rate of two cents for fifty miles and less.

Q. Are there other differences that you note?

A. The Lake City tariff provides for a rate of two and one half cents for fifty miles to one hundred miles, while our tariff provides for a rate of three cents for fifty to seventy five miles and three and a half cents for seventy five to one hundred miles.

Q. You need not pursue that comparison further for there are no distances in controversy in this cause exceeding fifty miles. Your rough material rates contemplate a certain amount of the tonnage of manufactured product after it is manufactured for outbound haul as all rough material rates do. Now suppose two lines participate in the outbound haul, how is the amount to which each of those lines is entitled determined? Suppose you haul the rough material into Nettleton and it was determined to ship this manufactured product, after being manufacured at Jonesboro, over the Frisco to Hoxie and thence to some other point on your line,
3803 either north or south of Hoxie, say to Newport or to Corning, how would the proportion which the Frisco and the Iron Mountain would have *be* determined?

A. That is not a supposable case.

Q. Suppose it did have to move over that route?

A. It would have to pay us the full tariff rate on lumber. The rough material rates can only apply on rough material going into the manufacturing point when the same line receives an outbound haul.

Q. I understand that perfectly, but suppose the same line receives the outbound haul?

A. There is no such case in the State of Arkansas and you can not have one. There is no such arrangement made. We would not arrange to give our product from rough material to the Frisco to hand back to us some place to continue the haul when we could take the haul direct ourselves.

Q. I think you do not understand me. Suppose, for instance, the Lake City road hauls rough material into Jonesboro, to be manufactured. Suppose it hauls that manufactured product, reshipped, as the shipper is bound to do, over the Lake City Road and say it is going to St. Louis. The Lake City road would handle it to Nettleton for delivery to the Iron Mountain or to Osceola or Blytheville and give to the Frisco. How would that re-haul be figured. It must come in somewhere. It must pass over two lines, either over the Lake City and the Iron Mountain or over the Lake City and the Frisco. This is the question that I am asking you, suppose that a gross sum of so many cents per hundred pounds

is charged for that haul, how is it divided between the two
3804 carriers?

A. An arrangement of that kind could be entered into, I presume, but it would have to all be made a matter of agreement and arrangement before hand. Today the manufacturer of lumber in Arkansas understands that when he brings in rough material that he can only have rough material rates applied when he ships the product out over the line which brings it in. If there is any diversion from that rule it must be pre-arranged.

Q. You do not understand. These rates only apply when it is to be re-shipped to some other point on carrier's line?

A. Yes.

Q. Have no application when shipped on some other carrier's line?

A. They all understand that. In that way the inbound carrier has a lien, you might say, on the outbound product.

Q. Do I understand you to say that if this shipment is hauled into Jonesboro the shipper is bound to give forty per cent outbound or pay the local rate? If it elects not to pay the lumber rate and does give a shipment to St. Louis and bills it over the Lake City road, you say the rough material rate has no application?

A. Not unless pre-arranged.

Q. Why not?

A. Because the rules do not permit it.

You have moved up state and interstate traffic. You have been talking about the rules of the Arkansas Commission. That is why I say the rules do not permit such movement. The rule of the Arkansas Commission says that rough material rates can only be applied in connection with the carrier that brought the ma-
3805 terial in. If the manufacturer elects to forward that product by some other line then he must pay the full inbound local rate, the lumber rate, that is the lumber tariff rate. He knows it, and we have no trouble with our shippers because they all understand it. They understand that if they want to divert the product from our line on an outbound movement that they have to pay the local rate in. It would be possible for the Lake City road to arrange with the Iron Mountain for the movement of the product from Jonesboro to St. Louis and some consideration be given to an inbound rough material rate but that would have to all be pre-arranged and the line as a whole from Jonesboro to St. Louis would have to take care of the absorption.

Q. I understand the full tariff rate must be charged to St. Louis. I am not questioning that. I understand that the full tariff rate must be charged, but when the whole tariff rate is charged and two carriers have assisted in the transportation, one carrying it a part of the way and one carrying it the balance, is there any fixed rule by which the compensation is divided or is it a matter of agreement?

A. It is a matter of agreement solely and there is no fixed rule. The general rule between all carriers is a mileage pro-rate but with

1609

a short line that is not followed. They frequently allow a short line a much larger division than a mileage pro-rate.

Q. Has the Iron Mountain an agreement of that kind with the Lake City during the last two years?

A. I could not say, I am not familiar with it.

Q. Who is familiar with it?

3806 A. Mr. Perkins.

Q. What is his official title?

A. Assistant General Freight Agent.

Q. Where does he live?

A. His office is in this building.

Redirect examination.

By Mr. SMITH:

Q. We have been questioning you about rough lumber shipments when the finished product is shipped out over the line that brought in the rough material, and you indicate the Arkansas Commission tariff, the provision of which is before you in the complaint in this case, to apply on the outward shipment when it passes over the line that brought it in and is delivered to a connecting line, the connecting line taking it either to a point in the state or to a point out of the State.

A. There are two rough material tariffs. While the rates may be the same in both tariffs their application is somewhat different. One applies on state traffic and one on interstate traffic. We do not have the same arrangement for joint rates between carriers on state traffic that we have on interstate traffic. Therefore, as a rule, the outbound movement of the product must be by the road which brings it in, the only arrangement we have for joint rates in the State being eighty five per cent of the locals. The manufacturer could not well afford to ship his product onto the second road, but would look for his rough material on the line of that road. On interstate traffic it is smewhat different. There is, as a rule, a general arrangement for through rates and divisions, and there are arrangements where a rough material rate applies on the rough

3807 material in, the product of which passes out over two or more roads.

Q. The tariff that you read the rates from in Missouri Pacific and Iron Mountain Tariff I. C. C. A-1127, and the rates you read were conditioned on the shipment out of the mill product over your line of road. Will you attach this tariff to your deposition as Exhibit "A"?

A. Yes.

Recross examination.

By Mr. ALLEN HUGHES:

Q. Under the tariff of the Arkansas Commission, when you haul inbound shipments of rough lumber twenty five miles and under the rate is two cents. Now what is the outbound rate on the manu-

factured product, box shooks, for instance, for this outbound haul, say from Jonesboro to St. Louis?

A. Twelve cents per hundred pounds.

3808 F. P. JOHNSON, being recalled for cross-examination, testified as follows:

By Mr. HILL:

Q. Mr. Johnson, have you your Ft. Smith terminal valuation, requested sometime since?

A. Yes, sir.

Q. Please explain what you have?

A. I have here a statement showing the property of the St. Louis Iron Mountain & Southern Railroad, embraced in our Ft. Smith terminals, showing the mileage, value per mile, total assessed value for the years, 1907 and 1909, and the differences between the two periods.

I also have a statement covering the property within the limits of the City of Ft. Smith, that is not covered by the State Board of Assessors.

Q. That is all shown on your statement?

A. Yes, sir.

I also have a blue print, if you want that as an exhibit, of the Ft. Smith terminals, located within the City of Ft. Smith.

Q. Yes, sir, I want that; they also show the terminals adjacent to the City that wasn't within the limits of the Ft. Smith terminals.

A. The statement of property does, but the blue print doesn't; it merely shows the line within the city of Ft. Smith.

3809 Q. I understand there is a connection between the Ft. Smith Suburban with your line, but that connection is outside the city limits, but there is now a physical connection?

A. Yes, sir.

Mr. MOORE:

Q. When was that made?

A. I don't know when the date was; my testimony was sometime ago, that they were not connected in 1907.

Q. You attach those as exhibits?

A. Yes, sir, the same are marked for identification as Exhibit "J-1" and are as follows:

For Exhibit "J-1" see Volume 9, page 5880.

3810 Q. You have prepared exhibits for your company in the Oklahoma rate case, have you not?

A. I made up the statement that accompanied the affidavit.

Q. What disposition did you make of the Ft. Smith Terminals in the Oklahoma rate case?

A. We didn't make any disposition of them in the Oklahoma case, they are not included there at all.

Q. Aren't included in any way?

A. No, ir.

Q. What do you do with this expense growing out of that trackage between Van Buren & Ft. Smith in the Oklahoma case?

A. Any expense that is incurred on the line that enters into the State of Oklahoma, is charged to the State of Oklahoma, but the terminal expense at Ft. Smith, this station and yard service, is all charged to the state of Arkansas.

Q. You have not treated that as if Ft. Smith were Memphis to Oklahoma?

A. No, sir.

Witness excused.

It is stipulated, that the statements of the Rock Island Railroad, under the court tariff may be introduced by the state up to the time of final submission, just as the statements are received by the state, and when all are in up to the final hearing, that they may be compiled together to make one statement, which may be filed, subject to objection as incompetent, irrelevant and immaterial.

3811 The State rests.

Mr. MOORE: Mr. Laing, the Passenger Agent of the Cotton Belt, is here and I would like to have him state what was done in regard to increasing the passenger rates.

Mr. HILL: He will be your witness.

R. H. LAING, a witness of lawful age, being duly produced, sworn and examined, testified in behalf of the plaintiff in rebuttal as follows:

Direct examination.

By Mr. MOORE.

Q. State your name.

A. R. H. Laing.

Q. Are you connected with The St. Louis Southwestern Railway Co.?

A. Yes, sir.

Q. In what capacity?

A. Assistant General Passenger Agent.

Q. How long have you held that position?

A. About seven years.

Q. Mr. Laing, I wish you would state if any change or readjustment of interstate passenger rates was made at the time the rates in the State of Arkansas were reduced from three to two cents.

A. Yes, sir.

Q. Just state what the facts were as to the readjustment
3812 of passenger rates at that time, and again the readjustment when the passenger rates were restored to three cents.

A. Our through interstate passenger fares are all combinations of the local fares, and wherever a state fare is reduced it reduces all interstate fares in which it is a factor. For example: the fare from

St. Louis to Texarkana is practially a combination of the fare from each station to the next station all the way down. You add all of those local fares between the different towns from St. Louis to Texarkana, together, and you have practically the through fare from St. Louis to Texarkana.

So, if you reduce the fares between the stations in Arkansas, from three cents to two cents, you make a corresponding reduction in the fare—the interstate fare, from St. Louis to Texarkana. At the time the Arkansas state fares were reduced all intrastate fares to and from Arkansas were reduced, and almost all interstate fares through Arkansas—that is, originating in some State this side of Arkansas destined to a point beyond, were reduced. When the fares were restored to a three cent basis in Arkansas, corresponding increases were made in the interstate fares.

Q. Were the interstate passenger rates in January 1909 on the same basis as the state rates?

A. Not from all territory.

Q. I mean, in the State of Arkansas.

A. The interstate?

3813 Q. Yes, I mean assume, now, Arkansas, and we will say Missouri—from Missouri to Arkansas: were the interstate rates on the same basis as the state rates?

A. From Missouri to Arkansas, yes.

Q. Was that generally the case—I just mentioned Missouri to Arkansas to illustrate.

A. That was to a large extent the case everywhere with the exception of the fares from Texas to Arkansas. They were not increased until August, 1909.

Q. With the exception of that the changes were—

A. The fares had all been adjusted practically in January 1909.

Cross-examination.

By Mr. HILL:

Q. Mr. Laing, would the reduction of the state passenger rates in Arkansas affect your Texas excursions or your homeseekers' rates from St. Louis or Memphis?

A. Not the rate per mile——

Q. That is what I mean.

A. —to any extent.

Q. Did the reduction of that Arkansas rate affect your California rates from St. Louis or Memphis to California?

A. The Arkansas did not, but the Missouri reduction did.

Q. We are talking about Arkansas; the Arkansas did not affect it?

3814 A. No, sir.

Q. Were the rates prevailing to Texas points, dominated by the M. K. & T., were they affected from St. Louis to Texas points?

A. On account of the Arkansas?

Q. Yes.

A. Yes, sir, they were—that is, in all my remarks here prior

to your questions I referred to the one way fares, which are always considered the standard basis in speaking of fares, and not of excursions.

Q. That did not affect the return trip, the round trip and excursion trip?

A. The change in the Arkansas fares affected the one way fares from St. Louis to Texas.

Q. Not to all of Texas, did it?

A. Practically the entire State.

Q. Take points that were reached by the M. K. & T. in Northern Texas from St. Louis—I do not remember the points—you probably know all the towns there.

A. It affected Dallas, Ft. Worth, Waco—caused a decided reduction.

Q. And did it not cause a reduction in the rest?

A. No, it caused a reduction in—I would say every point in southern Texas with the possible exception of Denison and a small territory surrounding Denison.

Q. The same thing would be true of other roads that have a shorter mileage to Texas, the country dominated by them
3815 would not be affected by it?

A. The short line mileage to 75 percent of Texas is through Arkansas, from St. Louis.

Q. Well, what about the other 25 per cent?

A. The difference, the reduction in Arkansas fares from three to two cents, with no corresponding reduction in Oklahoma, Arkansas would still be the rate making—

Q. You are running into another factor now. We are not trying Oklahoma. It is enough for us to try one at a time. I am asking about the Arkansas rate.

A. All fares from St. Louis to Texas naturally make through Arkansas with the exception of a small territory in the central Northern part of the State.

Q. You just stated about the 25 per cent: I want to know what effect the Arkansas rate has—

A. I did not say that 25 percent was the exception. I said that the rates to at least 75 percent would go through Arkansas.

Q. According to my arithmetic that would leave 25 percent that would not be—

A. In doubt?

Q. —in doubt?

A. Yes, sir.

Q. Did the Arkansas two cent rate affect that 25 per cent which is in doubt?

A. A portion of it, yes sir. I would not undertake to say
3816 the exact territory without having some tariffs at hand.

Q. Now, how about your rates to El Paso and Mexico?

A. The Mexican rates were affected, the one fare rates to Mexico.

Q. Are there any one fare rates to Mexico from St. Louis?

A. Yes, sir.

Q. You occasionally find a fellow who buys a straight ticket to the City of Mexico?

A. Yes, and we have a lot of fares that may possibly not be used, but they are in print.

Q. One of these paper tariffs?

A. Well, they are printed to be used.

Q. We have had a good deal of acquaintance with paper tariffs in this case. I do not believe we have been introduced to one on the passenger side before.

A. There is considerable one way business from the States to Mexico.

Q. From St. Louis to Mexico?

A. Yes, sir.

Q. One way?

A. Yes, sir.

Q. Practically all of that is a return trip, is it not?

A. Well, our line does a comparatively little Mexican bus-

3817 iness. I would not say what the proportion would be.

Q. I suppose you are an expert on passenger rates and you know what the other lines did?

A. The rate question is somewhat different from the question as to the amount of business handled to or from particular sections

Q. Don't you keep a reduced rate on Mexico at all seasons of the year, or does not the Iron Mountain road, if your road does not?

A. One way or round trip?

Q. Either way.

A. Twice a month there are comparatively low round trip rates in effect.

Q. How many months?

A. Two days a month.

Q. Is that not where nearly all of the traffic is handled, on those rates?

A. I do not think so, no, sir.

Q. How much of it is handled on those rates?

A. I would not undertake to say without——

Q. Mr. Stone promised to give us some figures on that, but he has not done it yet.

Q. What is your rate from St. Louis to the City of Mexico?

A. I would not undertake to say, without the tariffs.

Q. What is your straight rate and what is your excursion rate?

3818 A. That is another question I would not undertake to answer.

Q. Have you not seen a big advertisement of the Iron Mountain, forty seven dollars and some cents from St. Louis to the City of Mexico?

A. They frequently have rates.

Q. Have you seen that advertisement down here on Olive, and what is it, Sixth Street?

A. They have an office there at Olive and Sixth Street.

Q. You do not know the rates that they are running to Mexico?

A. I would not undertake to state that without a tariff.

Q. If they have a forty-seven dollar rate to the City of Mexico and return, about how much per mile would that be?

A. I would not care to answer that off hand. The Mexican business is a very small business; the volume of it does not amount to anything.

Q. Does not your Texas rate vary from twenty five to fifteen dollars, sometimes as low as fifteen dollars a round trip?

A. I do not think as low as fifteen dollars. There is considerable Texas territory to which twenty five dollars——

Q. How much per mile is that?

A. That depends on the destination.

Q. You are an expert on these matters?

3819 A. Well, it is a very easy matter to figure out. That will vary anywhere from close on to two cents a mile down to under one and one-half cent a mile.

Q. Do you mean that they have a variation in the passenger rate down there?

A. It depends on the destination.

Q. Is that rate based on the cost of service?

A. No, sir, it is not.

Q. It is not on the cost of service?

A. No, sir.

Q. Is not that California rate based on the cost of the service?

A. I do not think so.

Q. What is it based on?

A. It is simply an agreed rate.

Q. What?

A. It is simply an agreed rate.

Q. An agreed rate?

A. Yes, there is no basis for it.

Q. No basis for it?

A. Some one thought that was the right figure and put it there.

Q. Is that the sum of the locals between here and California.

A. No, sir.

Q. These gentlemen have been teaching me that is the

3820 way rates are made.

A. That is the rule, yes, sir, but there are a few exceptions to the rule.

Q. Several in Texas, are there not?

A. As I said before, my evidence on the construction of rates related to one way fares. The excursion fares are only a comparatively small part of the business.

Q. Do you know the cost per passenger mile for carrying passengers in Arkansas?

A. No, sir.

Q. Do you know what it is in Texas?

A. No, sir.

Q. Do you know what it is in Missouri?

A. No, I am not familiar as to the cost of doing business.

Q. The cost of doing business?

A. The cost of handling business.
Q. You make the rates generally?
A. No, the State Legislators have been making them for us.
Q. Did they make the interstate rates for you?
A. Practically, yes sir.
Q. They did? How did they do it, on the sum of the locals, is that the way?
A. The State Legislature says the rates shall not exceed so much per mile and that is our maximum; then we build combinations from that.

3821 Q. Do you think that the State Legislature makes them on the cost of the service?

A. I do not know, sir.
Q. Does your office make them on the cost of the service?
A. No, sir, we do not.
Q. What do you make them on?
A. We make them so much per mile as a rule.
Q. What determines it, how do you figure that out?
A. Well, in the State of Arkansas we figure our rates three cents per mile.
Q. Not all of them, do you?
A. 98 per cent of them.
Q. Well, let us see about that; don't you have a lot of books to sell down there at two cents——
A. No, sir.
Q. —or two and one-half cents?
A. No, sir, we honor an interchangeable mileage credential.
Q. Don't you issue them?
A. We are a party to the arrangement under which travelers get a net two cent per mile.
Q. Do you not sell a good many of those books, or honor a good many of them?
A. We honor quite a number, yes, sir.

3822 Q. Do you not sell two and one-half cent rate tickets there where the Rock Island and these other roads come in competition with you?

A. We meet competition, but there are very few points between which their fares affect us.
Q. The Iron Mountain meets them at a good many points, does it not?
A. The Iron Mountain will meet them probably more than we do.
Q. You think that 98 per cent of your rates in Arkansas are three cent?
A. Our one way fares, yes, sir.
Q. I am not talking about one way: I am talking about the whole business. We are not taking it piecemeal.
A. One way fare is really the basis for everything and that is the standard.
Q. I am asking you about what your fares are in Arkansas and you said 98 per cent are three cent: after calling your attention to this——

A. I would not say that on 98 per cent of our business we got three cents per mile.

Q. I did not think you would when you thought about it.

A. But you take our tariffs and the figures there, or 98 per cent, are three cents a mile.

Q. I have no doubt the tariffs would probably show 99.99 per cent——

3823 A. 98 per cent I think is about right.

Q. You have a good many paper tariffs on your passenger business?

A. You must remember there is quite a difference between our way fares and the excursion business and the commutation business, under which the mileage credential business would come.

Q. That is a very considerable business is it not?

A. It amounts to a great deal more than any Mexican business would amount to with us. Off-hand I would say that possibly five per cent of our business—local business in Arkansas, is done on the credential plan.

Q. How much of it would you say was excursion?

A. I could not answer that without getting figures from the accounting department.

Q. How much do you think would be affected by meeting competition of these two and one-half cent railroads?

A. Very little of it is affected by that.

Q. How much do you think would be affected on the Iron Mountain by that?

A. Well, any evidence I might give as to the Iron Mountain would be merely a guess, but I would say that I do not think there is over five per cent of their business that is competition with the Rock Island and Frisco two and one-half cent lines.

Q. Are these credential books good for interstate business as well as state?

3824 A. Yes, sir.

Q. What per cent of your business is handled on those, interstate?

A. I would say about the same percentage as handled on the state.

Q. Is it not more than that?

A. No, sir, I do not think so. They are largely used by drummers who make comparatively short trips, as a rule.

Q. When you start out to make an interstate rate you do not have to bother with the state legislature then. I do not suppose: what consideration moves you in fixing that rate?

A. Our one way fares are all combinations, using the local fares as factors. If our through fare is higher than the combinations it results in the passengers buying and rebuying and all we get anyhow is the actual combination, so we prefer to make the fare the combination of the two locals, as it may be, and handle the passenger through.

Q. Is that the way you actually do it? I understand why you prefer to do it and why you would not make it higher than that; but as a matter of fact, is that the way you generally make rates?

A. On one way fares, yes, sir.
Q. How about your other fares?
A. Excursion fares?
Q. Whatever else you want to call them, round trip, excursion, home-seekers, tourists.
3825 A. The round trip excursion fares depend largely on the occasion for which they are authorized.
Q. There are chronic occasions for it, are there not?
A. Twice a month in Texas.
Q. How about your rate to Hot Springs; is not that chronic—don't you have low rates there from all over the country?
A. There are round trip fares into Hot Springs all the year.
Q. And your line to California goes through Arkansas, does it not?
A. Yes sir.
Q. Is it the cost of the service that you consider when you fix those Hot Springs rates and California rates?
A. Well, the Passenger Department, as a rule, does not figure on the cost of the service.
Q. It does not? Are you sure of that, Mr. Laing?
A. They figure on the amount of business that can be secured.

Redirect examination.

By Mr. MOORE:

Q. You said your state tickets are made on a combination of the locals?
A. That is the standard one way fares are, yes, sir.
Q. Which represents the larger part of your business, the one way fare or the round trip fare?
3826 A. The one way fare represents by far the greater part of our business.

3827 C. E. PERKINS, recalled, being duly sworn to testify in behalf of the complainant in rebuttal, testified as follows:

Direct examination.

By Mr. MOORE:

Q. You have been on the stand before in this case?
A. Yes, sir.
Q. You are the General Freight Agent of the St. Louis Iron Mountain & Southern Railway, I believe, are you not?
A. I am.
Q. Mr. Ludlam, a witness on behalf of the state, testified in thic case that many interstate rates were made to govern large zones and the fluctuation of movement would affect the revenue materially; whereas it would not affect the expense in any sense; and, therefore, would destroy any connection or relation between the revenue and the expense:
I wish you would state if that is a correct view of the effect of zones rates which are illustrated in some of the exhibits filed by the State in this case.

A. In my testimony, on direct examination, I have admitted, as has also Mr. Watson, the fact that numerous elements other than the cost of the service entered into our rate adjustments to a greater or smaller degree. In other words, in offering transportation for sale we are not always able to obtain the same amount of profit over and above the cost. There are two elements which enter into
3828 our rate making other than the cost of service; one is commercial conditions and the other is competitive conditions.

In Exhibit 42, offered to show that the rates from the so-called "Defined territories" to what are generally termed "Texas common points" are on a blanket basis we have a condition in which the principles mentioned enter into our rate making to a considerable degree.

In establishing rates to this territory from St. Louis and the East we have a peculiar condition in that the Texas territory is entered by the transportation lines from three sides out of a possible four: the M. K. & T., the Santa Fe and the Frisco enter the State from the north; the St .L. I. M. & S., the Cotton Belt, the V. S. & P., and the T. & P. from the east; the Southern Pacific and also the Steamer Lines from the Atlantic Coast, enter from the south.

Dennison, Texas, a point in the extreme northern part of the state, and reached by the M. K. & T. and the Frisco, would produce the minimum haul for those two lines on shipments from St. Louis or the East. While a similar shipment to the same point of destination handled by the Illinois Central and the Southern Pacific through New Orleans, Houston and thence north, would offer the maximum service for that route.

A shipment to Houston, Texas, routed via the M. K. & T. the Santa Fe or the Frisco would offer nearly the maximum haul for shipments handled by either of these routes; while if routed via the Illinois Central or the Southern Pacific would yield the mini-
3829 mum haul via that route.

This is true in nearly all parts of the State, and indicates very largely why a blanket zone in the state of Texas is necessary.

If the Cotton Belt or the Iron Mountain Railroads were the only routes to reach the State of Texas, the condition would be entirely different. We could then, and no doubt would, make our rates on a graded scale, making them higher as we proceeded south or southeast through the State.

Attention has been drawn to the rates from St. Louis to Texas, but it should be borne in mind that St. Louis is used as a basing point for the rates from other so-called "defined territories." In the exhibit mentioned Territory "A" represents Pittsburgh Territory, from which rates are made by adding the following differentials to the rates from St. Louis:

| | |
|---|---|
| First class | Fifty cents |
| Second class | Firty-five cents |
| Third class | Thirty-two cents |
| Fourth class | Twenty-three cents |
| Fifth class | Nineteen cents |
| A | Twenty cents |

B.....Sixteen cents
C.....Sixteen cents
D.....Fifteen cents
E.....

Territory "B" indicates Chicago Territory——

Q. You are now marking out a zone marked "B" on Exhibit 42?

A. Yes, sir. Territory "B" indicates Chicago Territory, the rates from which are made the following differentials higher than

3830 from St. Louis.

First class.....Twenty cents
Second class.....Sixteen cents
Third class.....Twelve cents
Fourth class.....Ten cents
Fifth class.....Seven cents
A.....Nine cents
B.....Eight cents
C.....Seven cents
D.....Six cents
E.....Five cents

all of which indicates that as our distances and consequently the cost of service increases, our rates increase.

The rates to Texas Common Points are not made entirely from St. Louis. In many cases the rates are made from the territories east, and rates are then fixed from St. Louis on differentials under the rates so fixed from Eastern Territory.

This is due to the fact that the further East we go the more keenly do we feel the Water Competition of the Steamer Lines from New York to Galveston and Texas City. In adjusting our rates to Texas we attempt to arrive at a rate which will yield an average return. In other words, we do not figure on the trains to Paris, in the northern part of the state of Texas, nor on the rates to San Antonio, in the southern part of the State, but a rate which applied to the entire territory would yield an average return.

In the case of the "Lumber Zone," which has been referred to, commercial conditions govern to a large extent. It must be admitted that our profits vary as to individual shipments. A shipment, for instance, from Little Rock to Kansas City yielding larger

3831 profit than a shipment from Lake Charles; still our rates are adjusted so as to meet these conditions and yield a fair profit on our entire lumber business.

The zone basis in this instance has been largely the result of evolution. Without it, it would have been practically impossible to have built up and established the Lumber traffic as it exists today. When our lumber rates on yellow pine from the south were first established they were made entirely to meet the competition of the white pine from the north. At that time there was little or no pine shipped from southern Arkansas, Louisiana, or Texas, for the reason that that territory was then undeveloped. The competition was entirely from southern Missouri and northern Arkansas. The Grandin District

on what was then the Kansas City, Fort Scott and Gulf Railway, now the Frisco, and the Leeper District on the Iron Mountain Railway was the principal producing territory for southern yellow pine and rates were fixed to the Missouri River by arbitration, after a long rate war, on the basis of 15 cents from Chicago on the White Pine and the same figure from the Leeper-Grandin District on the yellow pine.

From the territory further south, which was then just beginning to develop, a differential of seven cents per 100 pounds was fixed; in other words, a rate of 22 cents per 100 pounds.

3832 It was found that this higher rate from the Southern territory could be maintained for the reason that the Pine was more prolific and easier to log than the Missouri Pine, the Missouri Pine cutting not to exceed 3000 feet to the acre while the Southern Pine ran from 10,000 to 15,000 feet to the acre. When the Southern territory developed it was found it would be impracticable to charge a higher freight rate as we went south, as practically all of the Pine in Louisiana and in Texas was of the same nature, and if we increased our rates as we went south the manufacturer in the southern portion of the State would be at such a disadvantage that he could not compete with the northern manufacturer. Therefore, as our rates have from — to time been re-adjusted we have been obliged to consider a scale of rates, not from Little Rock nor from Lake Charles, but from an average point of shipment. It is conceded that our rates from Little Rock, in and of themselves are high; while from Lake Charles they are low; and while, as a matter of fact, they do not yet represent (taken as a whole) what we feel we are entitled to, they are as high as conditions seem to justify.

This statement applies only to the points of origin. So far as the destinations are concerned our rates increase as the distances increase showing that while they are on the zone basis so far as the points of origin are concerned, they still are made to comply with our fundamental principle—cost of service.

3833 In this connection let us examine Mr. Hamilton's testimony with reference to the rate and movement from this zone. That is, the lumber zone. He states "Out of 584 stations in this zone 319 are located on 36 other lines which connect with the St. L. I. M. & S. Railway and which would receive for their haul a varying proportion of the rate."

There does not seem to be anything particularly remarkable in this statement, nor anything which would lead one familiar with conditions to say that these rates do not reflect cost of service, as has been stated. The Iron Mountain, in conjunction with other Trunk Lines leading from this zone, and reaching the consuming territory, fix the rates for application from their stations. These rates we have been permitted to average and so adjust as to receive a fair profit over and above all expenses.

If our lumber adjustment ended here, I take it the State could not make any serious objections to our theory or our basis, but there remains, as has been stated, some thirty-six short lines, varying in length from 25 to 300 miles, which do not reach the consuming territory, but which produce lumber in large quantities. What,

then, is to become of this tonnage? The rates have been fixed, as has been stated, by the Trunk Lines and the manufacturer on the short line cannot pay the local of the Short line plus the rate of the Trunk line and compete with his neighbor who is located on the trunk line. Therefore, as a necessity, the same rate
3834 is applied from the Short Line producing the tonnage and it is allowed a division of such rate for its service. This traffic, from its nature, can be and is handled at a less margin of profit and tends to greatly increase our tonnage, thereby reducing the general cost of handling all business.

Q. Your remark as to "short lines" there refers to the testimony of Mr. Hamilton with regard to certain rates on lumber—I mean a comparison of certain rates on lumber from Little Rock to points south and east thereof.

A. It refers to the testimony which Mr. Hamilton gave. I read one statement which he made. He goes on to pick out individual cases where we shipped so many cars of lumber from Alexandria proper and received a certain number of cars from the St. Louis Watkins and Gulf Railroad and certain others from the Louisiana Railway and Navigation Company.

Q. He refers, for instance, to a car from Malvern at 18 cents per hundred and from Saginaw, which is a greater distance at 14 cents per hundred and from the same point at 18 cents per hundred, growing out of allowances made to other connecting short lines. That is the condition he referred to in the statement you have made just now?

A. Yes, sir.

Q. That is brought about by the necessity of protecting the industries located on those short lines, is it not?

A. Yes, sir.

3835 Q. Proceed, Mr. Perkins?

A. Mr. Bee, in his testimony, states that the necessities for these zones do not at present exist. In this he is testifying to a condition of affairs with which he is evidently not familiar, as any one who is familiar with the freight rate adjustment in the South-west knows that these are conditions which the railroads cannot abolish without disaster to the shipping public. As a matter of fact, the Interstate Commerce Commission after a thorough investigation have approved this zone basis of making lumber rates.

I refer to the case of the Chicago Lumber & Coal Company vs. Tioga Southeastern Railway Company, reported in the 16th Interstate Commerce Commission reports at page 323.

While I do not feel that the zone basis of rates mentioned detracts to any great extent from the statements already made with respect to the cost of service, that element being present in a somewhat modified form, it is true that this basis is used only where commercial conditions fixes it, or in cases where the mileage is great and the zone rate will yield approximately the same rate per ton per mile on account of the length of the haul. Our general basis of rates is to a large extent on a mileage scale, that is, the rates increase with

the mileage, the increment being smaller as the distance increases.

3836 Our rates, as an example, from St. Louis to Arkansas, are 70 cents per 100 pounds, on First Class, at Moark, the first station in Arkansas, and grade up as the distance increases to $1.22 on First Class at Fulton, in Southern Arkansas.

This is also true in Louisiana, the rate to Jones Spur, the first station being $1.15 on First Class and grading up to $1.37 at Fenton, in the Southern portion of the State.

In Oklahoma the same conditions is found and while this Compony does not operate to any great extent in that State, the rates to points in the Eastern section, Sallisaw as an example, are $1.10 on First Class, while to the Western part of the State, Mangum as an example, the First Class rate is $1.30.

In Missouri our rates naturally increase from the East to the West, being on the Missouri mileage scale.

In Kansas rates grade from the Eastern portion of the State from 89 cents at Topeka on First Class to $1.46 at Scott City, in the extreme Western portion of the State, all of which indicates that the State is attempting to prove a rule by its exception.

3837 Q. Mr. Ludlam made some reference to the commodity rates:

I wish you would give some attention to the statement made by Mr. Ludlam that the same condition prevails with respect to the commodity ratings.

A. The same condition prevails with respect to the commodity ratings as mentioned in Mr. Ludlam's testimony. That is, he has attempted to prove by a few exceptions that the general rule which we have testified to does not hold good.

The Western Classification, concerning which testimony has already been given, governs on Texas traffic, as well as on all other traffic west of the Mississippi River.

There are, of course, exceptions to this Classification applicable on Texas interstate traffic, which exceptions change to some extent the rating or minimum weights as the case may be. These exceptions are issued as a convenience more than a necessity.

In other words, the Classification provides for no commodity ratings, only the ten classes, with the possible addition of a few high grade articles which are classed as "double first-class" and "three times first-class," and where conditions demand a special or commodity rating on a given article we attempt where possible to adjust this by an exception to the Classification, rather than by burdening the individual tariff with commodity ratings. This is not always possible, however, and in such cases commodity

3838 ratings are prescribed.

In these Classification rates, as well as in the exceptions, the same fundamental principles with respect to the cost of service as previously testified to, exists; that is, the light and bulky articles and the more expensive articles are given the higher ratings, while the heavier and more compact and less expensive, the lower ratings.

To this, as to all rules, there are exceptions and when we find

peculiar conditions which warrant a change, it is necessary that that change be made.

On page 1264 of Mr. Ludlam's testimony he states:

"I find that that tariff (referring to Southwestern Lines Tariff No. 1-DD) names a rate on beer in glass, at 48 cents per 100 pounds, with minimum of 30,000 pounds, and that the same tariff names a rate on bar iron of 55 cents per 100 pounds, with a minimum weight of 36,000 pounds."

and calls attention to the fact that the casualty risk on beer in glass would certainly be very much higher than it would be on bar iron.

Beer is an article which is manufactured very largely in the state of Texas, large breweries being located at Fort Worth, Houston and San Antonio, and in shipping beer from interstate points it must necessarily be at a rate which will permit it to compete with that manufactured within the state; and while the rate on bar iron represents probably a fair and reasonable rate, we are obliged to accept a lower rate on beer. In other words, accept a smaller profit or prohibit its movement.

3839 With respect to rate on excelsior, this is more or less of a paper adjustment, as I doubt whether on the rate mentioned there can be any material amount of business moved. This is well known as a very cheap commodity and one which is manufactured in the south as well as in the north.

Potatoes, with a minimum weight of 30,000 pounds at 54 cents per 100 pounds, are compared with a rate on horse shoes, of 62 cents, with a minimum of 36,000 pounds.

Shipments of potatoes represent relatively a large movement, while horse shoes a small movement. Potatoes are a necessity of life which, regardless of their perishable nature, will not stand as high a rate as horse shoes or other articles of that nature.

Poultry netting is not, as testimony would indicate, given a special commodity rating, but is one of the list of articles which is known as the "wire and nail mixture", that commodity providing for a rating on nails, spikes, staples, wire poultry netting and other like commodities in straight or mixed carloads.

There is no question but this rate was too low, and, as a matter of fact, correction has been made in our tariffs so that at the present time the rating on this list is 56 cents per 100 pounds.

Some history as to how this rate was originally established may be of interest, as it will show how many of our rates are limited

3840 and how the state rates have a direct bearing on our interstate adjustment.

The rate was originally fixed from Memphis to Texarkana basing on Little Rock, using from Little Rock to Texarkana the Arkansas state rate.

The rate to Texas common points was based on the combination through Texarkana using the Texas Commission rate from Texarkana to Texas common points, of 25 cents per 100 pounds, as provided for in Railroad Commission of Texas Circular No. 2013, effective March 24, 1904.

In other words, this particular rate was made absolutely on the

state rates, two factors being present—one, the Arkansas state rate, and the other the Texas state rate.

Compared with this commodity is iron or steel chain, which represent relatively a very small movement as compared with the wire and nail commodity list, and on which the conditions just explained do not exist.

In other words, were it not for the fact that our rates on wire and nails and that mixture were held down and limited by the state rates, they would be on a higher level than at present.

Hollow building tile is compared with pig iron. The former commodity, as it is well known, competes direct with common brick in the construction of buildings. Common brick, as is well known, is manufactured all through the state of Texas, and we are therefore compelled to haul the hollow building tile at an exceedingly low rate in order to permit its movement.

3841 Attention is called to iron pipe coils for refrigerating machines, as compared with bar iron. If we were not limited to factors beyond our control, the rate on the iron pipe would undoubtedly be higher than on the bar iron. However, the Texas Commission, on account of pipe being manufactured at the Penitentiary at Rusk, have established an extremely low rate locally in the state, which forces corresponding low rates from interstate points. This fact only emphasizes what has heretofore been said with respect to the effect of state rates upon interstate rates.

In regard to the comparison as between sheet iron pipe 36 inches in diameter, as compared with sheet iron, flat, I am unable to determine why the difference in favor of the former rate was carried. The fact, however, that these rates were corrected so that the current issue makes sheet iron pipe 62 cents as against sheet iron, flat, 60 cents, would indicate that there was an error in the original publication.

A comparison is made of the rate on matches of 71.5 cents from St. Louis, with the rates on wooden tooth-picks, of 80 cents from St. Louis.

This looks on its face as an unfavorable comparison but the facts are not fully set forth in Mr. Ludlam's testimony. Matches are shipped in straight carloads. In fact, that is the only commodity rating which is provided for in our tariffs while wooden tooth-picks are shipped in mixed carloads and are included in our

3842 woodenware mixture, which includes forty-eight different commodities of woodenware; so as a matter of fact, the tooth-pick rating is in reality an L. C. L. rate, and to make a proper comparison should be compared with the L. C. L. rate on matches which is the second-class rate, or $1.21 per 100 pounds.

In the case of wooden kegs as against saddlery and hardware, we have to a market degree the higher priced commodity taking the higher rate and I can see nothing particularly faulty in this adjustment.

The balance of the commodities mentioned are practically a repetition of those already covered as applied to Atlanta, Alama and Marshall, all of these rates basing on combination of locals through

Texarkana, Texas, by use of the Texas Commission local rate beyond that point, thus further emphasizing the relation between state and interstate rates.

In other words, the Texas state rates make the rates on the articles mentioned to these points.

Q. Are there a large number of commodities embraced in the tariff in which Mr. Ludlam found the articles cited by him, which I believe he designated as "Texas Tariff #1-DD"?

A. This tariff covers all the articles, or practically all the articles which can be shipped, thousands of them in number. The tariff is governed by the Western Classification, a copy of which I believe is already in evidence.

This Classification covers, as is known, all commodities which are shipped and assigns them to one of ten classes. So that as a
3843 matter of fact, this tariff with its ten classes and its commodities description covers practically all the articles which are ever shipped.

Q. Mr. Hamilton stated in his testimony, referring to what he said was a statement on the part of a witness of the railroads in this case, that the Arkansas Commission tariff denominated the Memphis rate, filed an exhibit (being Exhibit C-1), for the purpose of making a comparison between state and interstate rates in certain territory south of Little Rock:

I wish you would take that up now and explain it.

A. Our testimony has not been confined to the statement that the interstate rates from Memphis and other points are made on the rate from Bridge Junction, plus the bridge toll higher, although reference has been made, I believe, to this fact, and this condition of affairs existed on the St. L. I. M. & S. in 1907 and has continued to the present time to a very marked degree.

The rates to practically all points on our Memphis Branch are made bridge toll higher than state rates to Memphis Bridge Junction, which was on the west bank of the river.

As an example, the rate from Memphis Bridge Junction to McCrory are:

3844

| | | | | | | |
|---|---|---|---|---|---|---|
| 1st | class, | 40 | Cents | per | 100 | pounds |
| 2nd | " | 35 | " | " | " | " |

| C | " | 13 | " | " | " | " |
| D | " | 10 | " | " | " | " |
| E | " | 8 | " | " | " | " |

a difference of two cents per 100 pounds on each.

3845 From a casual glance at the exhibit (C-1) mentioned, it would not appear that there was any relation whatever as between the state and interstate adjustment.

As a matter of fact, however, our rates from Memphis to all points in Arkansas, were made by using three factors, one of which was the Arkansas Commission's local rates.

At the time these rates were in effect, the St. Louis, Iron Mountain & Southern had an agreement with the city of Memphis as to the rates which we would carry from that point to Arkansas as compared with rates in effect locally in Arkansas. That agreement provided that to points in Arkansas on the main line and branches south and west of Little Rock, except Fort Smith, Van Buren, the Greenwood branch and the K. & A. V. Division, rates from Memphis would be published the same number of cents per hundred pounds higher than the local state rates from Little Rock to destination, as the rate

from St. Louis was higher than the rate from Memphis to Little Rock, or the following figures in cents, per hundred pounds:

| | | | | | |
|---|---|---|---|---|---|
| 1st class, | 30 | cents | per | 100 | pounds |
| 2nd " | 25 | " | " | " | " |
| 3rd " | 20 | " | " | " | " |
| 4th " | 13 | " | " | " | " |
| 5th " | 10 | " | " | " | " |
| A " | 10 | " | " | " | " |
| B " | 10 | " | " | " | " |
| C " | 8 | " | " | " | " |
| D " | 6 | " | " | " | " |
| E " | 5 | " | " | " | " |

with the further provision that the rates from Memphis to Little Rock would apply as minimum figures.

3846 To illustrate this basis we will check the adjustment at Gum Springs, seventy miles south of Little Rock (that is one point mentioned in the exhibit).

The first-class rate under the Commission's tariff is forty cents, adding the differential for first-class mentioned, namely, 30 cents, produces the rate as shown in the chart, or 70 cents.

Second-class—the rate from Little Rock is 35 cents, plus second-class differential of 25 cents, or through rate of 60 cents.

Third-class local rate from Little Rock is 31 cents, plus differential of 20 cents, or 51 cents, and so on down through the entire list.

In cases where the interstate rates are shown to be the same to the points mentioned in the chart the Memphis to Little Rock rate has been applied as a minimum, these minimum figures applying only to the stations directly south and west of Little Rock, which it will be seen were selected by the state to disprove our basis.

Q. Is Gum Springs the most southerly point to which it applies?

A. Yes, sir, Gum Springs is the most southerly point to which it applies. That is the most southerly point at which any of the rates apply on that basis. All of the rates are not blanketed even as far as Gum Springs.

As we go south from Gum Springs, the Memphis-Little Rock rate does not affect the situation and it only affects it at all of the

3847 points mentioned on first-class, second-class and Class A, as shown by the chart.

Q. That is on three classes?

A. Yes, sir. In other words, the state has picked out a comparatively small territory in Arkansas where this condition exists, to try to prove that there is no relation between our state and interstate rates, while as a matter of fact, that comparatively small territory is an exception to the rule, although in that territory there is the relation between state and interstate rates, as I have explained.

Q. A similar chart has been filed as Exhibit D-1, illustrating the rates from St. Louis to certain points in Arkansas and containing a comparison of those rates to the Commission's rates: I want to call your attention to that.

A. The same condition exactly exists in the chart you mention, it containing a comparison of the rates from St. Louis as compared with

the state rates, for the reason that, as has been previously testified to, the rates from St. Louis are made on a differential over the rates from Memphis, and whatever the adjustment is at Memphis naturally the same adjustment prevails at St. Louis.

Q. That produces the condition as shown in the chart referred to?

A. Yes, sir. In other words, the explanation made of the Memphis adjustment explains the adjustment from St. Louis, the conditions being the same with different figures.

3848 Q. Go on with your statement, Mr. Perkins.

A. To stations in Arkansas in the vicinity of Arkansas City and Helena, the rates from Memphis are based on full combination of locals to and from Arkansas City and Helena, using the Commission's scale from those points.

All this will indicate how closely allied are the state and interstate rates. In some cases they are, as has been stated, made directly by using the bridge toll over the Commission's scale from West Memphis and in other cases a differential over the Commission's scale from Little Rock, while in still others on combinations using the Commission's scale and with Memphis fixed on this basis our St. Louis rates are, as has been testified to, adjusted differentially higher, which in turn affects practically the entire interstate adjustment.

Q. Now, Mr. Perkins, is there any condition which forces the Company to adopt that combination of state rates between Memphis and points near Arkansas City, any conditions competitive or otherwise? Explain what the underlying conditions are?

A. I can explain it better, probably, by citing the conditions at Helena.

The rates from Memphis to Helena are, of course, on a low scale on account of the river competition; the Illinois Central
3849 reaches Helena from Memphis by a direct line: if we should maintain a higher basis of rates (which we would if it were not for this competition), it would have the result of forcing shipments into Helena and from there they would be reshipped to the interior. The same condition, of course, would prevail at Arkansas City.

Now, at Helena we have the competition of the river and of the Illinois Central Railroad. We might get the business into Helena and we might not.

Further, it gives the shipper at Helena a very decided advantage. So, in order to adjust our rates so as to permit of direct shipment—which, by the way, is naturally cheaper for the railroad, we are obliged to recognize these combinations.

3850 Cross-examination.

By Judge HILL:

Q. You have used the term "relation between state and interstate rates" quite frequently in your testimony here, Mr. Perkins: I wish you would explain just what you mean by that.

A. By "relation between state and interstate rates" I mean that our interstate rates are dependent upon the rates as fixed on state traffic.

Q. I do not believe I quite catch that, Mr. Perkins: do you mean in all your remarks in your preceding testimony as to the relation between the state and interstate rates the effect that the state rate has upon the interstate rate?

A. By saying that there is a relation between the state and interstate rates I mean that the state rates, as I have said, affect to a greater or smaller degree the interstate rates. In that way the relation exists.

Q. Just what is that relation?

A. That relation varies. It is the subject of practically all of the testimony I have just given with respect to our rates from Memphis to Arkansas points.

Q. As I understood your testimony on that, it was to the effect that the Arkansas Commission rates had, in a measure, con-
3851 trolled the interstate rates to and from Memphis: is that correct?

A. That is correct.

Q. You mean by "relation between state and interstate rates" the controlling effect of the state rate upon the interstate rate?

A. I mean by the relation between state and interstate rates, as an example, where the state rates are reduced it will invariably cause a reduction in our interstate rates, possibly not to exactly the same degree; and where they are advanced it will permit of a smaller advance in the interstate rates.

Q. You say "probably not in the same degree": to what degree would that advance be?

A. That would depend entirely upon conditions.

Q. It is in evidence here that on the Cotton Belt Railway in the month of January 1909, following the promulgation of rates by the railroads, after Judge Vandavanter's injunction, that the interstate revenue increased nine per cent and the intrastate revenue increased ninety six per cent—I am speaking in round numbers of course. Is that such a degree of increase as you would expect when the interstate revenue is increased nine per cent that the intrastate revenue should be increased ninety six per cent?

A. I do not think, Judge Hill, that an increase or decrease in revenue can be taken as a criterion of a difference in rates A
3852 difference in the movement of commodities will have a very large bearing on that subject.

Q. Well, if you take the movement in a given month of state and interstate traffic, there is not any material difference between state and interstate movement, is there?

A. There may be a very marked difference.

Q. There may be, but I am asking as a general rule is that a fact?

A. I cannot say off-hand whether that is true or not.

Q. You have heard a great deal of testimony here, I presume, from witnesses largely on the railroad's side in this case, that state and interstate traffic moves hand in hand, that they move right together, haven't you?

A. I do not know that I recall that testimony.

Q. You know that to be a fact, whether or not you heard that testimony, don't you?

A. I would say, generally, yes, that is true.

Q. If you take a given month, or a given six months' period, or a given year, and you take all the revenue, state and interstate, for that given period, wouldn't it ordinarily reflect the same movement of the same classes of freight, state and interstate?

A. For a given time?

Q. Yes.

A. As between state and interstate, I should say it
3853 ought to.

Q. That is coming back to the proposition we started with on the Cotton Belt, where in one given month when the railroad made both tariffs, state and interstate, there was an increase in revenue of nine per cent on the interstate and ninety six per cent on the state: you say where the state rates are increased that they will permit an increase in some degree of the interstate rates: now, what I am trying to get at, was this revenue produced on the Cotton Belt for that month the proper degree of increase?

A. I cannot tell you anything about what was the result from revenue or what causes made that. I would say if it caused an advance of ninety six per cent in our rates it would not be correct; but what the controlling factors were for the increase in revenue I do not know, and for that reason I do not feel I could answer the question.

Q. From your knowledge of traffic in Arkansas during the month of January, 1909, would there be any reason why there should be any great difference in the movement between state and interstate traffic?

Col. MOORE: Do you remember what month it was compared with?

Judge HILL: It was compared with a six months' period.

Col. MOORE: It was compared with a period from July to December.

3854 Judge HILL: It was the six months' period for which you prepared your statistics in this case.

A. For the one month as compared with the six months?

Judge HILL: No, just comparing the movement of state and interstate traffic during one month.

A. No, sir, I do not know that there is any reason for any great difference in the movement between state and interstate traffic for that same month.

Q. That is what my question is.

A. But I cannot say as to what the conditions were on the Cotton Belt. I hardly feel competent to testify as to those conditions.

Q. You know something about freight traffic in the state of Arkansas, don't you?

A. Yes, sir.

Q. You have been making freight rates in Arkansas for two railroads for a number of years past, haven't you?

A. Yes, sir.

Q. Assuming (it is a fact) that just two months prior to this increase in showing, the state rates were put under an injunction and the railroads put in their own rates; and that they increased their interstate rates; and immediately following that there was an increase in revenue for that month of nine per cent on interstate and ninety six per cent on state business, wouldn't you assume that these increases had been made by the railroads in what it regarded
3855 as a proper relation between state and interstate rates?

A. You refer to the increase in revenue?

Q. Yes.

A. I would say from my knowledge of railroading and the movement of traffic, that the increase in revenue may not have had any relation whatever to either an increase or a decrease in rates. In otner words, we can and often do increase our revenue without any change whatever being made in our rates. We could as a matter of fact, increase our revenue with a decrease in certain of our rates. That depends altogether on the class of business which we handle.

Q. I understand that, Mr. Perkins. That has been fully explained and you stated it a while ago. But I ask you if, as a matter of fact, from your knowledge of conditions in Arkansas during January, 1909, there were any such conditions as would explain that.

A. Without going back and analyzing the movement for that month I could not answer the question.

Q. You know that the railroads increased their rates, both state and interstate, very much, and that immediately after that increase their revenue shows these percentages I have given you: don't you know, as a matter of fact, that most, if not all, of that increase was due to the increase in rates?

A. No, sir, I do not and I do not think it was.

3856 Q. You do not think it was?

A. No, sir.

Q. That is your opinion, is it?

A. Yes, sir, that is my opinion. My opinion is, Judge Hill, that you could not get, without any other controlling factors, an increase of 96% out of an increase we made in our rates, to save your life. In other words, if the movement had been identical for the two periods, you could not, to save your life, get an increase in revenue of ninety six per cent.

Q. Well, how about the increase of nine per cent on the interstate rates?

A. That may or may not have been due to the increase in rates.

Q. What do you think about it?

A. I do not know, without examining the movement. I would have to do that before making any answer whatever.

Q. When you increase your rates don't you look for a corresponding increase in revenue?

A. We hope to get it, yes.

Q. Don't you look for it?

A. Yes, I should say we do. In other words, that is why we increased our rates. And with the same movement we would get it,

but we do not always get the same movement. In other words, in one period of the year we will move cotton, while in another period we will not have any movement of cotton.

3857 Q. But that is getting into comparing one period with another, while the question I am putting to you is comparing the movement of state and interstate freight during the same period.

A. If I understand your question correctly, you stated there was an increase of ninety six per cent in the period you mention as compared with the six months previous, and on interstate movement an increase of nine per cent.

Q. Yes, as compared with the same period.

A. What I say is that in my opinion that fact would have absolutely no bearing on the increase or decrease in the rates. In other words, on the change in rates, because in other words if it were due to a change of rates and we had moved the same commodities and the same number of tons of the commodities, you could not get an increase of ninety six per cent to save your life; because we have never made any such change in rates, state or interstate.

Q. You increased your rates after you got your injunction from Judge Vandevanter, didn't you?

A. Yes, we increased our rates, but it did not look anything like ninety six per cent.

Q. It didn't to you perhaps, but it did to some of the shippers, didn't it?

A. I do not think it did.

Q. Didn't a great many of the shippers file affidavits showing that you had increased the rates two hundred per cent?

3858 A. It might have on some particular commodity, but take our rate adjustment as a whole and I would say off-hand the increase was not over ten per cent.

Q. That is all you think the increase was on state rates?

A. I am talking about interstate rates.

Q. I am talking about state rates. Your ten per cent about agrees with these figures of nine per cent increase in revenue on the Cotton Belt during January 1907. You seem to have made a pretty accurate guess on that. Now, how much was the increase in state rates?

A. I do not know what it was in percentage, but it was not ninety six per cent by a long ways.

Q. Didn't you increase the lumber rates over one hundred per cent?

A. No, sir.

Q. On the St. Louis, Iron Mountain & Southern how much did you increase the lumber rates?

A. I cannot tell you that without comparing them.

Q. Didn't you increase a great many commodities over one hundred per cent?

A. No, sir, I would not say a great many commodities. We may have increased a few, principally where the state had provided for an abnormally low commodity rate on less than car load movement we made increases.

3859 Q. You did not make a big increase on the lumber rate?
A. We made an increase on lumber, yes, sir, but it was not one hundred per cent.
Q. It was pretty close to it, wasn't it?
A. I do not think so.
Q. My recollection is that the increase on lumber was over one hundred per cent. Don't you remember that? Did you take part in that rate hearing down there before Judge Trieber?
A. At what time?
Q. As to the fact that your rates were unreasonable?
A. No, sir.
Q. Would a violent or large increase in rates cause a large increase in the volume of traffic?
A. I should say not.
Q. When there had been a large increase of state rates, which took place first before January 1909, would you expect a large increase of state traffic during January, 1909, to account for this ninety six per cent increase in revenue?
A. There might not be a large increase in tonnage, but there might be a decided change in the character of the tonnage.
Q. Do you know of any great change in the character of the tonnage in January, 1909, which would mark it as abnormal and strange?
A. I know this: at some season of the year in every year
3860 there is a great difference in the class of commodities we handle.
Q. January 1909 must have been a very strange and abnormal month on the Cotton Belt.
A. I don't know. It might have been. I am not competent to testify as to that fact. Mr. Watson may possibly be able to testify as to that.
Q. Coming back to your definition of the relation between state and interstate rates: you were speaking of the effect of the Arkansas Commission's rates on the Memphis rate, and as I understand you, that was by agreement between the Iron Mountain Railway and some officials representing the City of Memphis, wasn't it?
A. The actual conditions were, yes. That is, in this particular territory that Mr. Hamilton filed as exhibits C-1. In other words, there were seventy miles in there where that agreement fixed the rates.
Q. Didn't that agreement affect more than seventy miles?
A. That agreement did not affect more than seventy miles in that particular respect. It did affect the other territory in what we might call a normal way; in other words, the same way it is affected today. That is to say, where the rates are held down by a combination of the locals through Arkansas City or Helena. That is not a peculiar condition and it would not take an agreement to
3861 bring about that result.
Q. It was an agreement which brought about this Memphis relation between state and interstate rates, wasn't it?

Col. MOORE:

Q. Do you mean generally?

Judge HILL: I mean generally.

A. No, sir, I would not say generally. There was this agreement, which was made on what we considered at that time sound business principles, which necessitated a certain adjustment from Memphis as compared with the state rates.

Q. That was to enable the Memphis jobbers to compete with the Little Rock jobbers in Little Rock territory, wasn't it?

A. Yes, sir.

Q. Was that a commercial or a cost relation in the adjustment of state and interstate rates?

A. That was a commercial condition.

Q. That was a concession conceded by your road to the shippers of Memphis in consideration of receiving some terminal facilities in the City of Memphis, wasn't it?

A. I could not say Judge what the concession—it was not a concession—but what the arrangement was made for or what the conditions were. I was not with the road at that time. I understand in a general way there was such an understanding, but I really do not know what it was. I haven't found anybody connected with the road now who does know.

3862 Q. You still preserve those rates though, don't you?

A. No, sir, we do not.

Q. When did they go out?

A. I could not give you the exact date. They have not been in effect for some time.

Q. They were in effect during the period under inquiry in this law suit?

A. Yes, sir.

Q. Take Helena and Arkansas City: was that a cost or freight relation that affects adjustment between the state and interstate rates in those communities?

A. It was an adjustment which was forced on us by two factors, one of which was the low water competition rate into Helena and Arkansas City, and the other factor was the local rates fixed by the State out of those points.

Q. Those were commercial and competitive conditions which fixed that adjustment of rates between state and interstate, weren't they?

A. I do not know that you could call them commercial or competitive conditions. They were competitive so far as the adjustment of rates to Arkansas City and Helena were concerned, but they were forced by the state adjustment beyond there.

Q You might call that a political adjustment between state and interstate rates: would that convey your idea?

3863 A. That is a new term to apply to freight rates, but it might fit it pretty well.

Q. When you refer to the relation between state and interstate rates you mean the relation politically in such instances as that;

and commercially where commercial conditions bring it about, and by competition when competitive conditions bring it about, don't you?

A. All forces which tend to make our interstate adjustment depend on the state adjustment, yes.

Q. You say all these forces make it depend on the state adjustment?

A. No, sir, I say all those forces which do.

Q. Do you mean competitive and commercial conditions make interstate rates depend on state rates?

A. To some extent, yes.

Q. Just the other way I understand you in your main testimony. I thought you said commercial and competitive conditions, where they existed, accounted for an absence of adjustment between state and interstate rates.

A. I do not think so.

Q. Isn't it a fact that many interstate rates are made for you by conditions beyond your control at all?

A. Some of them are, yes.

Q. Many of them are, are they not?

A. It depends on what you mean by "many."

Q. State what you mean by many.

3864 A. I would say that these conditions as they apply to our entire rate adjustment would not be many. They are present, however, to a larger or smaller degree.

Q. Isn't it also a fact that the state rates not only in Arkansas but in other States in the Southwest are made by legislatures direct, or by a Railroad Commission, when the rates are not under your control at all?

A. That is true.

Q. And in some of the other States in this Southwestern country there is no control and you have a free hand to make your own rates there.

A. I do not know where they are.

Q. How long have you been in the business?

A. I have been in the business about twenty years.

Q. Has Louisiana any legislative control over rates?

A. Yes, it has a State Commission which controls every rate we have.

Q. How about Tennessee?

A. We do not operate in Tennessee.

Q. How about Mississippi?

A. They have a fierce one there. We do not operate there but I have heard of it.

COL. MOORE: You have heard the thunder of it?

A. Yes, sir.

Judge HILL:

Q. There is a Commission now in Oklahoma, but formerly there was none in that State?

3865 A. I believe in every State in which we operate the rates are controlled by State Commissions.

Q. In 1907, the period of our inquiry here, there was no commission in Oklahoma, was there?

A. I do not recall just when the Oklahoma Commission did take effect, but it seems to me it was before that, wasn't it?

Q. I don't know. You have referred frequently to an adjustment between state and interstate rates, using the term "adjustment of interstate rates": I wish you would define what you mean by "adjustment of interstate rates."

A. By "adjustment of interstate rates" I mean our interstate rate fabric, if you please.

Q. You mean your whole system of interstate rates?

A. Yes, sir; that is it.

Q. You do not mean the adjustment of an interstate rate from St. Louis to Little Rock, for instance, but of the entire interstate rates on a given commodity over your entire system; is that what you refer to when you speak of the adjustment of interstate rates?

A. The adjustment of interstate rates as spoken of in railroad parlance means our entire rate fabric; as I have stated, that is our ten classes and the various commodities.

Q. It just means rate schedules?

A. That is it.

3866 Q. You do not mean you adjust it to Missouri or Oklahoma, or to an Arkansas rate, or to a Missouri rate?

A. Not necessarily. In other words, instead of saying "rate adjustment" I might have said "rate scale," or any other term of that kind.

Q. I rather thought that was what you meant, but you kept using the term "adjustment" and I thought perhaps you were adjusting it into one of these other rates.

A. Adjustment is a common term in railroad parlance to designate our rate fabric.

Q. Mr. Perkins, in the testimony you gave in chief I notice you were reading from a paper: you have prepared your testimony very carefully upon matters, haven't you?

A. I have tried to go into the matter carefully, yes.

Q. The testimony you gave in your direct examination a while ago was in the main reading a very carefully prepared paper, in answer to questions Mr. Moore put to you, wasn't it?

A. Yes, sir.

Q. And you feel reasonably certain that the testimony you have given there is accurate?

A. I do.

Q. You have not given it off-hand, but have given it a great deal of time, thought and consideration, haven't you?

A. Yes, sir.

3867 Mr. HILL: I cannot proceed further with the examination of this witness before reading the transcript of his direct examination.

3868 Cross-examination of Mr. C. E. PERKINS, continued.

By Judge HILL:

Q. Mr. Perkins, I notice at page six of your testimony you say "Territory B indicates Chicago territory the rates from which are made the following differentials higher than from St. Louis" and you give the differentials. "All of which indicates that as our distances and consequently the cost of service increases, our rates increase." That you regard as a correct statement, do you, Mr. Perkins?

A. Yes, sir.

Q. Suppose you had a shipment of first class goods from Chicago to a Texas common point: that would be a differential of twenty cents over the St. Louis rate, applied to that shipment, to make the rate from Chicago to the Texas common point, wouldn't it?

A. That is correct, yes, sir.

Q. Suppose that shipment came over the Chicago & Alton from Chicago to St. Louis and was here delivered to your road: what division of that rate would the Chicago & Alton get?

3869 A. Twenty per cent.

Q. That would be how much?

A. 33.4 cents.

Q. What is the first class rate from St. Louis to Texas Common points?

A. $1.47.

Q. You give the Chicago & Alton, then, 33 cents of that rate?

A. Yes, sir.

Q. Your revenue would decrease on account of the increased distance of the shipment from Chicago, wouldn't it?

A. Our individual revenue would decrease to some extent for the reason that we are obliged to divide with another line.

Q. Then what do you mean by saying here:

"Adding this differential as your distances increases and consequently the cost of service increases, your rates increase."

A. I speak there of the total distance the shipment travels, not over our line particularly but over all our lines, that the distance increases and, therefore, the rates increase. Now the division of that rate is a different proposition.

Q. As a matter of fact your revenue, when you are speaking of the revenue you get, decreases instead of increasing from the fact that that haul is from Chicago instead of from St. Louis?

A. That statement taken by itself is a fact, yes.

3870 But our haul does not increase. I said that the haul for the entire shipment increases, for the entire length of the haul. That haul increases and, consequently, the rate increases. In other words, as the haul increases we did not apply the St. Louis rate up to Chicago. We applied the higher rate for the reason that the haul is increased.

Q. Your cost of service on that haul from Chicago as compared with the haul from St. Louis to some Texas common point is the same, is it not?

A. The cost of the service probably would be the same, or substantially the same. The value of the service would be somewhat less.

Q. The cost of the service would be the same?

A. Yes, sir; substantially the same.

Q. And yet, from the fact that that haul comes from Chicago, as compared to a haul that originates at St. Louis, your revenue is less?

A. Somewhat, yes, sir.

Q. To the shipper the rate is increased, but your revenue is decreased?

A. The rate for the entire service is increased.

Q. But your revenue is decreased?

A. Our individual revenue is, yes, sir.

Q. In this case your revenue is divided upon a track mileage basis, your interstate revenue, is it not?

A. No, sir.

3871 Q. How is it divided?

A. It is divided on an arbitrary basis, an agreed basis you might say.

Q. In making up the statistics in this case on your interstate revenue how is it divided?

A. To what statistics do you have reference?

Q. The statistics on your interstate revenue that you put into this case, showing what your interstate revenue is in the State of Arkansas for a given period?

A. I don't know. I did not have anything to do with those statistics.

HUBERT ROTH, recalled.

JUDGE HILL:

Q. Mr. Roth, how is your interstate revenue divided in these statistics?

A. On a straight track mileage.

JUDGE HILL:

Q. Then, Mr. Perkins, taking for illustration two shipments, one from St. Louis and one from Chicago, going over your line to the same Texas common point, your revenue being divided on a track mileage basis in this case, would put a different revenue for the same service into the statistics of this case, would it not?

A. Well, I do not feel competent to answer that question, Judge. I have not had anything to do with statistics which were com-

3872 piled or applied in this case. I do not know what they were.

Q. You accept Mr. Roth's statement as true?

A. Yes, sir, but outside of that statement I have no knowledge of that.

Q. In my question I am assuming Mr. Roth has testified to the truth and I ask you to assume that he has. Taking that as assumed to be true then I will ask you to answer my question.

A. I have no information as to whether we have any statistics

governing shipments from Chicago, for the division of the revenue on shipments from Chicago, filed in this case.

Q. You are not willing to take Mr. Roth's statement then as a fact and answer the question?

A. Not as you ask it, no, sir, because I do not know. But so far as I know we have not any statement of that kind in evidence.

Q. You know that you have exhibits in this case showing your interstate revenue in Arkansas, do you not?

A. Yes, sir.

Q. You have heard Mr. Roth state that that revenue was arrived at on a track mileage basis?

A. As between state and interstate?

Q. No. He said that the interstate revenue was arrived at on a track mileage basis.

3873 A. I do not understand from that there is any evidence in this case that our shipments from Chicago, for instance, have been divided on a track mileage basis, or that shipments from Pittsburg have been divided on a track mileage basis, as between our line and our connections. That is what you are trying to get me to testify to now?

Q. No, I am not trying to get you to testify to anything except as to the effect of what Mr. Roth stated as a fact.

A. I do not know that what Mr. Roth stated has any relation to the fact you are trying to get me to testify to. I cannot see it if it is there. I cannot see the relation at all.

Q. You know you have statistics in this case that set forth the interstate revenue derived from traffic on your road for a period of six months, do you not?

A. I think there is. I am not fully familiar with the statistics but I understand that is in evidence.

Q. Mr. Roth has here stated, in your hearing, that the interstate revenue is apportioned on a track mileage basis. That is, Arkansas is given credit for so much of the interstate shipments as are represented by the mileage of those shipments in Arkansas: you understand that, do you not?

A. Yes, sir.

Q. Now my question is this: assuming this statement to be true, that in a shipment from Chicago of first class merchandise to a common point in Texas, and a similar shipment from St. Louis to the same common point in Texas, the revenue derived from

3874 these two shipments being divided on a track mileage basis would make the revenue for those two shipments different, although the cost of the service was the same.

Mr. MOORE: Do you mean by that question the total revenue derived, from that particular shipment, or the revenue that accrues to the St. Louis Iron Mountain Railway from that shipment.

Judge HILL: My whole question is confined to the revenue of the Iron Mountain road.

Mr. MOORE: I did not know that the witness would understand that.

A. Let me see if I understand your question: It is, that the proportion of the through rate from Chicago, which accrues to the Iron Mountain south of St. Louis, in the case of a through shipment is apportioned as between state and interstate on a track mileage basis; and in the case of a shipment from St. Louis, the entire rate from St. Louis proper is apportioned between state and interstate on a track mileage basis?

Q. Not between state and interstate; but the rate itself between Missouri and Arkansas, or whatever state it runs through, is apportioned on the track mileage basis. In this instance it is between Missouri and Arkansas because your line runs only in Missouri and Arkansas.

A. In other words, your question in regard to the through shipment from Chicago relates to the proportion of the rate
3875 which accrues south of St. Louis.

Q. Which accrues in the State of Arkansas?

A. I think I understand your question now.

Previous question is here read to the witness.

A. The revenue would be somewhat different on the two shipments. In other words, we would not be in a position to earn the same amount of profit on the two shipments; our profits would be different, in other words.

Q. You would not get the same amount of revenue, whether there was a profit in the revenue or not?

A. No, sir, we would not get the same amount of profit either.

Q. You do not know whether you ever made any profit on it, do you?

A. Yes, sir, I would say if it was first class we would make a profit.

Q. That would be pure guess, that you made a profit?

A. If we do not make a profit on first class goods we would be bankrupt right now.

Q. You have no data to know that you make a profit on that $1.47 rate, have you?

A. $1.47 is the highest rate we have got, and if we do not make a profit on that we would be in the hands of a Receiver long ago.

Q. I understand your argument, Mr. Perkins, but have you any data to show the cost of carrying that $1.47 per hundred shipment?

3876 A. Not that particular shipment.

Q. Your judgment is, that your rates on first class goods are high enough to make you a profit?

A. Yes, sir. If we had no other rates we would be doing fine.

Q. I have used first class on those two shipments, as an illustration. That same thing is true of all other shipments that come from Chicago to Texas common points, compared to shipments from St. Louis to Texas common points, is it?

A. Yes, sir, that is true.

Q. You set forth here tables on the classes of differentials, and without going into the detail of them, I assume this illustration

which I have worked out of twenty cents on first class would apply, differing of course in detail as to all the others; is that true?

A. That is true.

Q. I have used this illustration merely for Chicago: would not that also be true of all of what you have termed "Defined territory" differing, of course, as to amounts and degree?

A. Yes, sir, it would. In some instances we would obtain fully our local rates; in other cases we would not. In other words, the differentials which are mentioned there are made to approximate as near as practical the locals up to the Mississippi River. In many cases, on account of certain conditions they are lower. We
3877 have, therefore, in some conditions under which we would get our local rates and under other conditions we would get less than our local rates. We do not have a percentage division of the rates after we get east of the Illinois-Indiana state line.

Q. Your revenue would be in varying proportions as the shipments would differ from different defined territories?

A. Slightly varying. They would not vary to any great degree.

Q. This illustration which we have used, of first class from Chicago to St. Louis, generally would apply to the balance of the traffic, Texas common points coming from defined territory north and east of St. Louis?

A. As to actual results in the figures, you mean?

Q. Proportions, I mean. I do not mean actual figures.

A. I would say it would come pretty close to it. It might vary one way or the other.

Q. That would be a fair illustration, of the principle, is the point I am getting at: isn't that true?

A. That is true.

Q. Take the other end of the line: what did you say was the furthest Texas common point?

A. I mentioned San Antonio; that is one of the furthest southern Texas points.

Q. Well, take San Antonio and take that shipment from St. Louis first class to San Antonio it would be $1.47: How
3878 much of that rate would the Iron Mountain get?

A. It would get a division of it.

Q. Yes, but I am asking you how much it would get.

A. I could not tell you offhand.

Q. Could you tell me approximately?

A. Its approximate mileage pro rate between our line and the I. & G. N.

Q. Is that the usual rule you have with all the shipments to Texas common points a mileage pro rate?

A. No, sir.

Q. What is the rule?

A. It is a varying rule. We have arrangements with each different line. They are made sometimes on actual mileage and sometimes on constructive mileage and sometimes on an arbitrary basis.

Q. They vary, however, I presume with the length of the haul in Texas?

A. Yes, sir, the longer the haul the more the line in Texas gets.

Q. Approximate that shipment to use it as an illustration—say a shipment of shoes from St. Louis to San Antonio, Texas: You get $1.47 per hundred as the gross revenue: how much of that $1.47 per hundred pounds would the Iron Mountain road get?

A. Well, I should say, roughly speaking, 55%.

Q. Something like 70 cents: it would be between seventy-
3879 five and eighty cents; that is right, is it not?

A. Yes, sir.

Q. Take a similar shipment to the next Texas common point: what would that be?

A. Our proportion?

Q. Give me first the nearest common point in Texas?

A. I would say Marshall, Texas, is a nearby point.

Q. What would you get on that shipment of shoes to Marshall, Texas?

A. 70 per cent.

Q. Seventy per cent?

A. I am speaking from memory now.

Q. I am not asking you to be accurate, but speaking simply as to the proportion, that would be $1.03 that you would get on that shipment?

A. Very close to it—$1.02.

Q. It would be about twenty-five cents difference, in round figures, on the revenue received from the shipment to Marshall and the shipment to San Antonio?

A. That is about correct, yes, sir.

Q. The services that your road would perform for those two shipments would be indentical?

A. Yes, sir.

Q. There would be no difference in the cost of the service?

A. No, sir.

3880 Q. There is heavy traffic on your road to Texas common points, isn't there?

A. As compared with our entire traffic, no, sir.

Q. What do you mean by "as compared with your entire traffic": you mean the entire traffic of the Iron Mountain System?

A. Yes, sir

Q. I believe it is in evidence here that 51% of your traffic passes through the state—what is known as trans-state"?

A. Through Arkansas?

Q. Yes.

A. That does not necessarily mean it goes to Texas, though.

Q. I was going to ask you, what is your judgment as to what proportion of that 51% would go to Texas common points?

A. You mean what proportion of that proportion?

Q. Yes.

A. Necessarily the Texas common point shipments are included in that 51%.

Q. I want to get an estimate as to what proportion of that 51% would be represented by shipments to Texas common points?

A. Less than ten per cent.

Q. How much less than ten per cent?

3881 A. Less than 10% of the 51%. In other words, it would be a rough estimate but it would be somewhere between five and ten per cent I should say of that 51%

Q. The same situation exists on business from Texas common points, does it not?

A. Yes, sir.

Q. That is heavy traffic, isn't it?

A. I included in my estimate the business to and from Texas.

Q. You would put that from five to ten per cent of the 51%, would you?

A. Yes, sir.

Q. The same situation would exist in regard to these divisions of the rates from the Texas points as we have been illustrating to the Texas common points, would it not?

A. Yes, sir.

Mr. MOORE:

Q. Would the divisions be the same?

A. Yes, on the same basis.

Mr. HILL:

Q. The shipments then, say from San Antonio to St. Louis, the division of the rate going to the I. & G. N. would be on a track mileage basis, would it?

A. Practically on a track mileage basis. It is not an absolute mileage pro rate.

Q. What is it, if it is not that?

A. It is a constructive mileage, to a certain extent—from San Antonio proper I think it is actual mileage.

3882 Q. Well, take the other Texas common points: the general system I am trying to get at and not any isolated case.

A. With the I. & G. N. and the T. & P., who are our closest connections, generally the mileage basis is used. That is as near as you can come to it, without taking a record and taking the division to each point.

Q. Suppose your shipment goes to some other road than the I. & G. N. or the T. & P.?

A. Then the basis of division is altogether different.

Q. What is that basis?

A. There is not any set basis applied to all lines. It is a matter of agreement between the interested lines, entirely.

Q. And that would be a varying proportion you would get from each?

A. It would be a proportion which would be on some general theory; that is, as the Texas local mileage increases their proportion would increase, as a general proposition.

Q. Your service would be the same on all of that, would it?

A. Yes, sir.

Q. But your revenue would vary for this same service, then, upon

the lines on which the shipment originated, and also upon the distance it was hauled by that other road?

A. There is not any question about that.

Q. There is not any question about it?

3883 A. None in the world.

Q. I do not know but I believe you have heretofore answered the question but to be certain I will ask it again:

That would be the same proportion whether the shipment originated in Texas or whether it was destined to the same point in Texas?

A. The same principles are applied.

Q. I understand the same principles, but I ask if it would be the same amount?

A. It would not be necessarily the same amount. In some cases the northbound and the southbound amounts are different.

Q. That is what I am asking about.

A. As a general proposition they are the same, but in some cases on the same lines the northbound and the southbound amounts are different.

Q. That again would make a variation in your revenue, depending on whether it was a northbound or a southbound shipment?

A. Yes, sir, that would make a small difference, yes.

Q. Do you remember the first class rate from St. Louis to Texarkana?

A. $1.37 per hundred pounds, I think it is.

Q. What is it to Little Rock?

A. $1.00 per hundred pounds.

Q. Does not that $1.00 rate extend south from Little Rock a considerable distance?

3884 A. It extends to Gum Springs,—that is, it did in 1907.

Q. That is what we are talking about now, 1907.

A. Yes, sir.

Q. It did not extend to Texarkana?

A. No, sir.

Q. How far is Gum Springs from Little Rock?

A. 68 miles.

Q. Then your shipment from St. Louis to Little Rock would be $1.00 and the same rate would apply down about seventy miles south of Little Rock?

A. Yes, sir.

Q. Of course it would cost you more to haul that freight from St. Louis to Gum Springs than to haul that same freight to Little Rock?

A. I should say it would, to some extent, yes, sir.

Q. In speaking of the lumber shipment from the zones you stated at page 9, so far as destinations are concerned the rates increase as the distance increases; showing that while they are on a zone basis so far as the points of origin are concerned, they are still made to comply with our fundamental principle—cost of service.

Do you not have delivery zones where lumber is delivered as well as zones where the lumber originates?

A. As a necessity we do not make a different rate to each different station. The same rate will probably extend to a number

of different stations on our line. As a general proposition,
3885 as the distance increases those rates increase. In other words, our rate, quoting now as an example the present rate because I cannot recall just what the rates were that were in effect in 1907—but for example our rate on lumber today to Kansas City is 24 cents and to Omaha it is now 25 cents (it was 26½ cents per hundred pounds). And as you go further west from Omaha our rates grade up, on the Nebraska State rate higher than the Omaha rate, straight along.

Q. I understand that——

A. (Continued.) And as we go further away our rates increase. The same is true into Iowa. As we go further from Missouri River our rates increase steadily until they get up to St. Paul and that territory. If we go east of the Mississippi River our rates increase the amount of the local beyond Cairo or Thebes. Now naturally on our rails there will be certain groups of stations which will take the same rates.

Q. That is the point I am getting at.

A. You will find in those groups they increase as you go further away. In 1907, the rate to the Missouri River was 23 cents. You get further west and it is shown on the exhibit filed that the rate is 28½ cents.

Q. If you will permit me to interrupt you, Mr. Perkins, I am not questioning that at all and you are getting away from my question.

Mr. MOORE: I would rather he finished that answer.

3886 A. (Continuing:) As you go further west we reach the maximum rate which we can apply this 34 cents to Colorado common points. That rate applies to quite a number—to a large number, in fact, of stations on our lines, for the reason that it is the maximum rate.

Mr. HILL:

Q. My question was, was it not a fact that the lumber moved on the zone rate to other zone territory—or whatever you term it?

A. There are not supposed to be a zone, no, sir. We do not make a zone. Zone means there is a blanket territory from or to which the rates are the same, conditions making it necessary that they should be the same.

Now, we do apply some rates to a number of different stations. Those stations change. As an example, we have changed the rates now to Colorado common points. The rate is 37½ cents per hundred pounds and that has changed to a very marked degree the group of stations to which that Colorado common point rate heretofore applied.

Q. You are getting entirely away from my question.

A. I am trying to answer it to the best of my ability, Judge.

Q. It is simply this: Isn't is a fact that your lumber rates in Texas on zones in their origin or destination—and we have used the term "zone" in this testimony as meaning a defined territory in which the same rates prevail?

A. We never use that in railroading as a fixed territory—a zone.

If you say a group of stations where the rates are the same, I will agree with you.

3887 Q. That is just a different use of terms. Then it is a fact that from a group of stations south of the Arkansas River say to the Gulf of Mexico the lumber moves on the same rate. And going to destination it moves into points wherein there is varying distances from that point and take the same rate to a given defined territory?

A. That is true.

Q. Take this Exhibit No. 40, which you have heretofore approved, which shows that lumber moved from the zone rate in south Arkansas, Louisiana and Texas, goes to Zone A at 23 cents, which I believe is the Kansas City trade center, isn't it?

A. Missouri River group, yes, sir.

Q. That extends from Coffeyville, Kansas, to Omaha, Nebraska?

A. It did at that time.

Q. That is what we are talking about and not the present rate situation. And which extended as far east as Washington, Missouri and as far northwest as Douglas, Nebraska; and as far southwest as Carthage. I have correctly stated that, have I not?

A. Omaha is the farthest point west.

Q. That is correct, is it?

A. Yes, sir.

Q. All those shipments from any point in that zone region, south Arkansas, Louisiana and Texas, went to that zone A at 23

3888 cents per hundred pounds. Then the next zone here I see is Zone C where it took a 28½ cent rate. That seems to extend from Anthony, Kansas, as the south point to Salina, Kansas, as the north point; and from a point just west of Wichita to a point just east of Olcutt: that is correct, is it not?

A. Yes, sir. There are a few stations right in that vicinity that take the 28½ cent rate.

Q. And there is another zone rate from near Hoisington, Kansas and extends to Pueblo, Colorado.

A. That is as far as our line runs.

Q. And then on the Denver & Rio Grande as far south as Trinidad and as far north as Denver which took a 34 cent rate.

A. Yes, sir.

Q. That is a correct statement of the lumber rate situation, is it not?

A. That is a partial statement of the lumber rate situation. If you say that is the lumber rate situation you have not entirely stated it, because you have neglected to include in there the adjustments between those points where the rates grade up. In other words, you pick out two or three rates and say that is a correct statement of the lumber rate adjustment. It is partial only, so far as you have shown it.

Q. It is a correct statement so far as it is shown?

A. Yes, sir, so far as it is shown; but you have not shown

3889 the intermediate grades between the various points, showing that the rates grade up as the distance increases.

Q. We will take up some of those:
I wish you would explain your system where your lumber is not shipped to these zones, which have been indicated on the map which you have approved, but which is shipped say through those zones.

Mr. MOORE: You mean the points between the zones?
Mr. HILL: No, I said through the zones.

A. I do not understand what you mean by "explain our system."

Mr. HILL:

Q. You have just stated you had a different system of grading shipments by distance.
A. No, sir, I said you had not mentioned any intermediate points between those zones, which naturally are on a different basis. I cannot say what they are or what they were in 1907 without taking a tariff and going through it.
Q. You mean a system of grading according to distance applied except in these zones?
A. I mean to say a graduation, yes, as you go further west, which would run all the way up from 23 to 28 cents, for instance. I cannot say offhand what they were or to what stations they applied. It is too far back and it is a detail which I have not in my head.
Q. When this lumber goes off your rails at Kansas City or Omaha from any of those trade centers out there, the blanket rate
3890 would apply to Kansas City or to Omaha, I presume, would it not—say it was going beyond Kansas City or Omaha?
A. I do not understand that.
Q. Would it apply, so far as you haul it, or do you get a proportion of it? I want to know your system?
A. On business destined to connecting lines the through rates are published, naturally. That through rate is divided between our line and the connecting line. In other words, we would not get our local up to Kansas City.
Q. That is what I am asking.
A. No, sir.
Q. You would get a varying proportion according to the distance although your haul was only to Kansas City?
A. That is right.
Q. In other words, it is the situation in regard to Texas common points applied to lumber?
A. Yes, sir, very largely. It is the same thing I testified to as to the points of origin. If the origin is off our line we do not get the same amount of revenue that we do if it is on our line.
Q. You take a case where two shipments are made from Malvern, where there would be a twenty-three cent per hundred pound rate to Kansas City; if that were delivered to you at Malvern by a tap line would you get say six cents off, or whatever your division would be; it would be 17 cents for one and 23 cents for the other?
3891 A. That is assuming that the tap line division is six cents.
Q. Some of yours are, and I am taking that simply as an illustra-

tion. You would get 23 cents per hundred pounds on one shipment and 17 cents per hundred pounds on the other shipment for identically the same service?

A. That is as between a shipment originating at Malvern proper?

Q. Yes, and one which was delivered to you by a tap line there.

A. We have no tap lines which get six cents at Malvern.

Q. I am using that as an illustration merely. You have plenty of tap lines, which do get six cents?

A. No, sir, we have not. Because Mr. Hamilton mentioned certain lines but they were railroads two or three hundred miles in length.

Q. Call them what you please. Instead of tap lines call them connecting lines.

A. The point I want to make is, that the example you are giving is an impossible one, from Malvern. That is all.

Q. You do have a connecting line or a tap line at Malvern, have you not?

A. Yes, sir.

Q. And you have also a line at Malvern where you get shipments direct, have you not?

A. No, sir, so far as I know all shipments we get at Mal-
3892 vern are from the Malvern and Freco Valley.

Q. Have you any other points on your line? I happened to think of Malvern but take any point where you have a connecting line and also saw mills?

A. That would be possible.

Q. I may have been wrong in using Malvern but the point is the same using Gurdon or some other point.

A. As an illustration it is all right.

Q. Take for illustration that you have hauled two cars of lumber, on one of which you get 17 cents per hundred pounds and on the other 23 cents per hundred for the same service.

A. Yes, sir.

Q. And carrying that illustration a point further, if one of those cars, say the one which originated on the connecting line went to another carrier beyond Kansas City, and it would get 6 cents per hundred pounds say for illustration, you would get eleven cents out of that shipment whereas you would get 23 cents out of another shipment.

A. That would be impossible.

Q. And the service would be identical.

A. That I say would be an impossible—I know it would be an impossible proposition.

Q. Why?

A. Because if the division was as much as six cents the rate would have increased beyond Kansas City. In other words, the
3893 rate to Kansas City is not the rate to connecting lines necessarily, but it is the higher rate. That rate might have been 28 cents instead of 23 cents.

Q. On the connecting lines?

A. Yes, sir, on connecting line business.

Q. How much would you make on that, say it was to some point beyond Kansas City where your rate was 28 cents: how much would the Iron Mountain get out of that shipment?

A. I would say, roughly speaking, our proportion up to Kansas City would be twenty cents.

Q. And if you had already taken out six cents to give to connecting carriers down there in the woods, that would leave you 14 cents for that shipment?

A. Yes, sir.

Q. And on one shipment originating at the imagined point you would get 14 cents and on the other shipment from the same point you would get 23 cents, for identically the same service?

A. No, sir, not for the same service.

Q. What would be the difference?

A. The difference would be that on business going to a connecting line, for instance, our service would be through and when we got it to Kansas City we would simply set it on the transfer track while business delivered to Kansas City we would probably have to switch it or perhaps have to absorb—in nine cases out of ten we would have to absorb the varying switching charge of five to six dollars there at Kansas City. All our deliveries at Kansas
3894 City provide for "Kansas City delivery". That car may have been intended for an industry and it probably would be on the belt line; most of the lumber dealers are on the belt line. We would have to pay the belt line the switching charge. The way-bill would have to go through our office and be revised and collection of freight charges made. While all of that additional service and additional charge would be eliminated on business going to a connecting line at Kansas City.

Q. That is, if they made through billing?

A. We do have through billing with all our connections.

Q. Then it would be more expensive to you to deliver that to an industry at Kansas City than it would to deliver it to a connecting line?

A. Yes, sir.

Q. In this mileage pro rate of the revenue on that, that would not be taken into consideration, would it?

A. The mileage pro rate? Those facts would not be present because the mileage pro rate is applied only to through shipments.

Q. Your expenses on that shipment in Missouri would be greater than it would be in Arkansas per mile, and yet you have divided the revenue on a mileage pro rate that does not properly reflect that: is not that true

A. No, sir, I do not think it is true. That is, one would offset the other. A shipment from a mill point proper in Arkansas
3895 we have to handle the car to the mill. We switch it in and then go and get it and put it in the train and take it up to the junction point, say Little Rock, and put it into a train and take it on.

Q. I am assuming, for the purposes of this question, that two cars originating at the same place, say Freeo Valley, your connect-

ing road at Malvern and one destined to Kansas City proper the other destined to a point beyond Kansas City. On the car destined to Kansas City proper your haul is the same but your terminal expenses at Kansas City are more expensive than the terminal expenses on the one going to the connecting line: that is correct, is it not?

A. Yes, sir.

Q. Making a mileage pro rate of those two rates, you have not reflected in that that difference in the terminal cost at Kansas City, have you?

A. I presume I have. In other words, while I have not divided any of that expense which does not come under my jurisdiction, I would understand that the terminal expense would be deducted before pro rating.

Q. You think that would be the correct way, do you not?

A. I think that would be done, yes, sir. It would need to be done in both directions, however, to make it correct. Perhaps on a similar shipment going to Arkansas the expense would be on the Arkansas end. So to make it correct, of course, they would have to deduct the terminal expense at both ends.

3896 Q. A mileage pro rate would not be correct unless the terminal expenses were deducted, would it?

A. If it were applied in both directions it would probably equalize itself.

Q. Do you think that is an answer to my question?

A. Yes, sir. We very often equalize those. We have arrangements with some line, for example some connecting line, where the terminal expense and where the bridge arbitrary are deducted before pro rating. We have other arrangements where they are not; but where each one takes care of its own terminal expense, on the theory that one equalizes the other.

Q. Have you any such expenses in Arkansas as they have at Kansas City?

A. Not as expensive; I should say not.

Q. It would not be fair to equalize such things as Kansas City or Chicago terminal expense with the expense at the terminals in Arkansas, would it?

A. The expense of a particular shipment might be as heavy, yes, and they might equalize themselves.

Q. You put it as a general proposition that in your opinion the expenses on a shipment going through Kansas City and Chicago equal the terminal expenses on a shipment to Arkansas?

A. Our shipments from Arkansas to our stations on the Missouri Pacific do not go through Kansas City to any appreciable extent. In other words, our lumber route is through Coffeyville.

3897 Q. That is getting away from the proposition. You do have shipments through Kansas City and you do have them through Chicago and through New York, do you not?

A. Yes, sir.

Q. The proposition you laid down a while ago was, that there might be a general evening up of those terminal expenses and I am

asking you if there are any terminal expenses in Arkansas that could be equal or could even up with the terminal expenses in Kansas City, Chicago, or New York.

A. Yes, sir, I would say yes, the general expense of delivery. A shipment say from Little Rock would be probably as expensive as in Kansas City. We have the same clerical work exactly. And in case of a shipment destined to an industry on a connecting line we have practically the same switching charge to pay that line.

Q. Then you would even up Little Rock with one of those terminals?

A. I would say that would be practically so.

Q. Are there any other termina's in Arkansas that are anything like comparable to St. Louis, Kansas City, Chicago or New York?

A. Every competitive point would illustrate that same fact. We would have exactly the same clerical work to perform. We would have the switching charge to pay the connecting line at Forest City or Malvern or at Pine Bluff or in fact any competitive point,
3898 $2.00 or $3.00 a car, which is just as much money in Arkansas as it is at Kansas City.

Q. Are you going to even up all of the terminal expenses in Arkansas against all the terminal expenses out of Arkansas?

A. I am not trying to even up anything, Judge, I did not even know about that revenue as divided on an accounting basis. I am simply trying to answer your question.

Q. I understood you to say you would even them up.

A. I simply said they might be evened up that way. I do not know even what they are. The dividing of expenses between States is not a matter that comes before the Traffic Department at all. We do not attempt to do that.

Mr. MOORE:

Q. Mr. Perkins are you speaking now of terminal expenses in Arkansas or other States as applied to individual shipments, or the total of the general expenses say at Little Rock, and the total of the general expenses at Kansas City, and the shipments collectively that originate and are delivered at those points?

A. I am speaking of the individual shipments that Judge Hill has named.

Judge HILL:

Q. Come back to the individual shipments if you prefer to take it that way, you instanced some individual shipments to Kansas City, one of which would be more expensive on account of the terminals there, and the other shipments passing through would be less
3899 expensive on account of the less use of terminals: is that correct?

A. Yes.

Q. Do you say it would be fair to divide those two individual rates on a mileage pro-rate without taking into consideration the extra expense of your terminal at Kansas City?

A. I cannot say without I know how the whole matter is handled.

Q. I am not asking you how the matter is handled, but I am asking you what you think of the fairness of it.

A. I say I cannot answer that without I know how it balances. You cannot take one end of a proposition and say whether or not that is fair, without knowing the other differences.

Q. To what other conditions are you referring?

A. As to whether or not a similar action is taken at the other end of the run.

Q. I am taking your illustration here.

A. I would say that in dividing the revenue between States on a mileage basis, if the expenses at Kansas City were deducted before pro-rating, then the same character of expense at the other end should be deducted. But if the expense at Kansas City were not deducted then Arkansas should take care of her terminal expense.

3900 Q. In reply to Col. Moore's question I understood you to say this: the individual shipments you are referring to, and I am going back to, from the original shipments we were discussing —that is, the two cars of lumber shipped from the Freeo Valley Railway Co. at Malvern and carried to Kansas City on your road, the one delivered to an industry on the Belt Line at Kansas City, and the other delivered to a connecting carrier: you said it would be more expensive to the Road to deliver to the industry on the Belt Line than to deliver to the connecting line.

A. At the same rate?

Q. I am asking you if it is a fact that to divide those rates representing those shipments from the Freeo Valley Railway Co., which were carried to Kansas City, on a track mileage basis, is fair.

A. It might or might not be.

Q. Is that the only answer you can make to the question?

A. I stated before I could not take that end of it without taking the other end.

Q. But I have taken the other end; both of them originating at the Freeo Valley Railway Co. at Malvern.

A. You do not say what the practice is with relation to taking care of the expenses, whatever they may be in Arkansas.

3901 Q. Taking the individual shipments, I do not see that that would make any difference. The terminal expenses in Arkansas are exactly the same on those two shipments, aren't they?

A. As a matter of fact you cannot fix a rate that would pay you on all shipments by taking two individual shipments.

Q. You said you were speaking of individual cases and not general ones. I am taking the individual cases in reply to that suggestion. Now, take those two individual cases, the shipments from Arkansas where the terminal expenses are bound to be the same, so there is no difference at that end of the line, is there?

A. No, sir.

Q. You have pointed out the difference in Kansas City, and there being no difference in Arkansas I bring the question home to you again, would it be fair to make that division on the mileage basis?

A. I cannot say just from those two individual shipments whether it would be fair or not as a general rule.

Q. I am not asking for a general rule. I am asking about these two individual cases. You said you were speaking of individual cases, and I am trying to hold you down to those two individual cases and not asking you to apply a general rule.

A. You cannot apply a general rule to an individual shipment.

3902 Q. What is the general rule?

A. I do not know.

Q. You have heard a good deal of the testimony in this case, haven't you?

A. I have heard a good deal of it, yes.

Q. Did you hear Mr. Doddridge and Mr| McPherson testify to shipments passing through Arkansas as if on a bridge?

Q. Did you hear Mr. Doddridge testify at all, and I did not hear Mr. McPherson on that portion. I do not think I have heard Mr. McPherson on the stand and I know I did not hear Mr. Doddridge testify.

Q. Assuming that these gentlemen did testify that this trans-state traffic (which amounts to 51 per cent) passed through the State of Arkansas as if upon a bridge—and by that I assume they mean without terminal expense: say, take for illustration there were the same shipments from Chicago and St. Louis to Texas common points, or from Texas common points to Chicago or St. Louis; or take it there were lumber shipments from Louisiana through to St. Louis or Kansas City: shipments of that grade I am referring to, which would have no terminal expense in the State of Arkansas, excepting division terminal expenses: or terminal expenses on that business not being in Arkansas, would make the expense of that business in Arkansas much less than it would be in Missouri or Texas, or the other points on either side of Arkansas, wouldn't it?

3903 A. I would say it would be less, yes, sir.

Q. Then, would it be fair to divide the rates on that business on a track mileage basis while the expenses had been heavier in Texas and Missouri and Louisiana than they had been in Arkansas?

A. I would say that would depend somewhat on the exact nature of the shipment, as to whether it would be fair or not.

Q. Take the entire lumber traffic, as an illustration.

A. Well, I would say as a general proposition the expense would be somewhat greater, but just how much I am not prepared to state, outside of Arkansas than it would be in Arkansas. There would be some terminal expense outside of Arkansas to be considered. I am not prepared to say, however, what basis would or would not be fair to divide that business on as between state and interstate.

Q. I am not asking you for a general basis, but I am asking you if this track mileage basis would be a fair basis on which to divide say the lumber traffic which passes through Arkansas from Texas to Kansas City and St. Louis: is the track mileage basis a fair one to divide that on?

A. As applied to that particular business I would say probably the

track mileage would not be altogether fair. That might be the nearest basis that could be arrived at for dividing it, however.

3904 Q. That is lumber you are referring to, where you say it would not be fair?

A. Yes.

Q. Take shipments to Texas common points and from Texas common points passing through Arkansas on the Iron Mountain Railway: would a track mileage basis of division on that be fair?

A. It would depend on the shipment. Take the shipment from the East for instance that you have mentioned as coming to us at St. Louis from the East, I would say it would be fair, yes.

Q. It would depend on where it would originate, as to whether it would be a fair basis or not, wouldn't it?

A. The same conditions would not necessarily prevail on a through shipment as on a local shipment originating in the State of Missouri.

Q. For illustration take all the traffic that goes direct from St. Louis to Texas common points, or terminal expense here in St. Louis, and the terminal expense for delivering it in the various cities of Texas: Is the traffic mileage basis of division on that fair, when it passes through Arkansas as on a bridge?

A. I do not feel that I am competent to testify on that. I have not given that feature of it any study. As a matter of fact I

3905 have not given any attention to the subject of how they divide it, or if it is divided on track mileage, as to the factors that are considered.

Q. I am not asking you how these gentlemen divide it. You have brought that into the case yourself by calling attention to the difference in the terminal expenses at Kansas City.

A. I have not brought the track mileage basis into it.

Q. No, but you brought into it the difference in the terminal expenses at Kansas City, which naturally led to the inquiry. If you have introduced a subject you are not competent to answer, you have introduced it yourself.

A. You are asking me about an entirely different subject. You are asking me if track mileage is a fair basis of division as between States.

Q. As between States on either side of Arkansas, where the heavy terminal expenses are, and not in Arkansas.

A. I simply explained that on a shipment to Kansas City the terminal expense would be heavier than on a shipment delivered to a connecting line at Kansas City.

Q. I understand that, and I have taken that and followed it a step further and developed these matters about which I am now asking you.

A. You are trying to make me testify about something I

3906 do not know anything about.

Q. Isn't it a part of your business to make these divisions?

A. No, sir.

Q. Between the different connecting carriers?

A. Yes, sir, between the different connecting carriers but the

apportionment of earnings or expenses to the different parts of the system, no.

Q. I understand that. But the basis of division between the different lines in Texas coming to your line at St. Louis, it falls within your jurisdiction to make those divisions, doesn't it?

A. Yes, sir.

Q. You have testified that in fixing these various divisions you have tried to consider the cost of the divisions service, as I understand you: is that correct?

A. The cost of the service enters into all of our rates and division making, yes.

Q. Take the grain traffic: Mr. McPherson testified, as I recall it, that there was a very heavy grain traffic going from the Northwest to New Orleans, and I think it went through the State of Arkansas as if upon a bridge—according to their theory: now I will ask you if it would be a fair basis of division of the revenue from that grain traffic coming from the Northwest, to divide that on a track

3907 mileage basis.

A. I have tried, Judge, to explain to you that I do not know anything about the divisions as between the different parts of the line. I do not know the first thing about it.

Q. I am assuming now that it was divided on a track mileage basis. Assuming that to be true, I will ask you if that is a fair division of that revenue.

A. I would not like to answer that off-hand.

Q. You do not know whether it is or not?

A. No, sir.

Q. How do you think that grain would compare with the lumber? Which would have the most terminal expense outside of Arkansas, grain or lumber?

A. That would be a pretty hard comparison to make. I would say the terminal expenses would probably run about the same. That is, there would not be very much difference. In some cases one would be heavier than the other, or vice versa.

Q. If the terminal expense would be about the same and that would not be fair for lumber, would it be fairer for grain?

A. I do not know enough about the divisions as between the different parts of the system to enable me to answer you intelligently.

Q. You stated at page 7 of your testimony:

3908 "In the case of the lumber zone which has been referred to, commercial conditions govern to a large extent. It must be admitted that our profits vary as to individual shipments. A shipment, for instance, from Little Rock to Kansas City yielding a larger profit than a shipment from Lake Charles: still our rates are adjusted so as to meet these conditions and yield a fair profit on our entire lumber business."

I wish you would explain just what you mean by that Mr. Perkins?

A. I mean that the rates on lumber as applied from the lumber zone which has been referred to, not taking into consideration necessarily the rate from the most Northern point or from the most South-

ern point, is fixed so as to yield a fair average profit from the entire zone.

Q. What do you mean by "an average profit"?

A. I mean taking the earnings which we will receive from shipments from the North end of the zone, and the earnings which we will receive on shipments which will originate in the central part of the zone, averaged together will yield a fair return.

Q. Wouldn't you have to know the cost of carrying this lumber traffic in order to determine whether or not you have earned a fair profit on it as a whole?

A. Not absolutely necessary.

Q. I did not ask you absolutely. But you have to know it, either absolutely or some other way, wouldn't you?

A. No, sir, not necessarily.

3909 Q. How would you find it out?

A. We would find it out by a comparison of our earnings on lumber with our total earnings.

Q. Those are the only statistics they have, the average cost per ton mile on all your business?

A. Yes, sir.

Q. You have no statistics as to the cost of your lumber business?

A. We have no statistics, no, sir.

Q. You have no statistics as to the revenue as a whole from the lumber business?

A. Yes, sir.

Q. You have that?

A. Yes, sir.

Q. Do you know just what it is?

A. Yes, sir.

Q. Do you know what that is per ton per mile?

A. Yes, sir.

Q. What is it?

A. I could not tell you off-hand just exactly what it is, but it is in the neighborhood of six mills.

Q. What is the average cost per ton per mile for all your business?

A. The total cost is in the neighborhood of between five and six mills.

Q. Now that is the way you have figured that there would

3910 be a profit on that: you have taken your total cost of all your business as being somewhere between five and six mills and you found that the revenue on all your lumber business was about six mills; and, therefore, you figure that you have made a small profit on the entire business.

A. Yes, sir.

Q. Is that the process of reasoning?

A. That is about it.

Q. That is what you mean by this statement I have just quoted from your testimony: is that true?

A. To what statement do you refer?

Q. The one I have just read you that rates are adjusted to meet these conditions and yield a fair profit on the entire lumber traffic?

A. Yes, sir.

Q. That zone extends from the Arkansas River South to the Gulf of Mexico and includes all of Louisana and a part of Texas, doesn't it?

A. Yes, sir.

Q. Do you know what volume of that lumber traffic originates in Arkansas—I mean what proportion of it?

A. No, sir.

Q. Could you make an estimate?

A. No, sir, I would not like to make an estimate without going into the figures some. I would say, however, it is small as compared with the volume from further South.

3911 Q. It would probably not be over twenty per cent, would it?

A. It would not be that much.

Q. About what would it be? I do not mean any close accurate estimate, but I want to get the result of your best judgment.

A. I would say between ten and twenty per cent or somewhere around there.

Q. And somewhere from eighty to ninety per cent of the lumber originates South of Arkansas?

A. Yes, sir.

Q. I mean South of the State line.

A. Yes, sir.

Q. Rates on lumber shipped from Arkansas of this ten to twenty per cent are much higher—that is, the proportion your line gets is much higher than on the bulk of the shipments that come from places outside of Arkansas?

A. No, sir.

Q. Why not?

A. We get the same proportion whether it comes from Arkansas or Louisiana.

Q. You get the same proportion?

A. Yes, sir.

Q. On a track mileage division?

A. There is not any track mileage division about it. We have our rails in Arkansas and we have our rails in Louisiana:

3912 if the rate is 23 cents from Arkansas to Kansas City, and the rate is twenty-three cents from Louisiana to Kansas City, we get the same proportion.

Q. You heard Mr. Roth testify that when you come to divide that revenue between Arkansas and other States you divide on a track mileage basis?

A. You said "your line."

Q. I should have said "your line in Arkansas."

A. Then what is your question now?

(Previous question read to the witness.)

Q. Now answer my corrected question.

A. If what you mean—and that is what I am trying to get at, what you mean,—do you mean, do we get more per ton per mile for handling traffic from Arkansas than from Louisiana?

Q. Yes.
A. Yes.
Q. The service is the same. For the same service you get more per ton per mile for shipments from Arkansas than you do for shipments from Louisiana and Texas.
A. The service is greater.
Q. From Louisiana and Texas?
A. Yes, sir, the service is greater from Louisiana and Texas to some extent than from Arkansas.
Q. When you are speaking of average profit on this entire lumber traffic you did not have in mind that the revenue derived
3913 from the traffic in Arkansas would be apportioned on a track mileage basis, did you?
A. I did not have any such facts in mind, no sir.
Q. Mr. Perkins, the rate per ton per mile on the lumber, ascertained on the track mileage basis, taking the lumber traffic of Arkansas, would be much higher than six mills, wouldn't it?
A. You mean the lumber traffic originating in Arkansas?
Q. Yes.
A. Probably it would be higher, yes.
Q. You stated at page R-11 of your testimony, speaking of the division of the rate with the connecting carriers,

"This traffic from its nature can be and is handled at a less margin of profit and tends to greatly increase our tonnage, thereby reducing the general cost of handling all business."

Do you think the lumber delivered to your road by connecting carriers is handled at a less cost than the lumber delivered to you by a saw mill on your tracks?
A. I did not say it was handled at a less cost. I said it was handled at a less margin of profit. The cost would be very nearly the same. We do not expect and cannot get the same amount of profit, even though the cost may be substantially the same, out of all traffic.
Q. I do not think you made it very clear here (indicating page R 11). It would rather indicate the opposite in this testimony.
A. I did not say anything about cost in that testimony;
3914 I said profit.
Q. That is handled at the same cost but with less revenue: that is what you mean, isn't it?
A. I would say it is handled at substantially the same cost, but with a different degree of profit.
Q. That is less revenue, isn't it?
A. Yes, you can call it that if you want to.
Q. That is what it is, isn't it?
A. We are dealing in profits.
Q. We are not in this case, but we are dealing in revenue.
A. You are speaking to me as a freight man, and a freight man is looking after profits.
Q. He is looking after revenue primarily, isn't he?
A. Revenue is profit.

Q. It is not always profit, is it?
A. We try to make it so.
Q. You are referring to gross or net revenue?
A. To gross revenue.
Q. Then it is handled for less gross revenue but at the same cost?
A. That is not what I said exactly.
Q. Substantially the same cost, I believe, is your exact language.
A. I would rather stick to what I testified to.

Q. Didn't you testify it was handled at substantially the
3915 same cost with less gross revenue?

A. I testified it was handled at substantially the same cost and less profit.
Q. Where did you get the profit?
A. The profit over and above expenses. We do not necessarily figure on the same expenses.
Q. You deal with just two elements: you pay out so much money for expenses and you get so much money from the shippers as gross revenue?
A. Yes, sir.
Q. That is all you deal in?
A. Yes, sir.
Q. And the difference between that is profit or loss as the case may be?
A. No, sir, it is not.
Q. What is it?
A. There are varying costs. We have our gross cost. That is the cost figured on all the expenses of the road. Now, on everything we haul we do not make a profit over and above that figure. For example, our gross expenses may be between five and six mills per ton per mile and we may on some particular commodities handle business for as low as four mills per ton per mile. We are making a profit, nevertheless, over and above our transportation cost in that particular instance.

Q. You are making it on the whole business and not
3916 on those particular shipments you are carrying for a loss?

A. No, sir, we are making it on those particular shipments.
Q. How do you know that?
A. Because we know about what our transportation cost is. It is something like a man in the grocery business: he may not be making on sugar an amount that will pay him a profit over and above all his fixed charges, but it will pay him a profit over and above the cost on that particular item.
Q. What do you mean by "cost" in this regard?
A. Cost may be two things, so far as a freight man is concerned: cost can be and is the total cost of operation which figures all of the items that enter into the operation of a railroad from beginning to end. Now, in the nature of our business we cannot always handle all shipments so as to make a profit over and above those entire charges. If we did we would be getting to your tonnage theory en-

tirely. But we do not and we cannot. Some commodities are very cheap and would not stand charges which would pay us a profit over and above our entire expenses. Some business we have to haul as low as four mills per ton per mile, but if we handled all our business at four mills per ton per mile we would be handling all our business at a figure which would be below our general cost and we would be bankrupt.

Q. As I understand you then it is this: some commodities
3917 you haul for less than cost—for instance, four mills?

A. No, sir.

Q. What do you mean by that?

Mr. MOORE: You did not distinguish between general cost and capitalization cost.

Mr. HILL:

Q. I have not understood you, Mr. Perkins, if that is not what you mean.

A. I stated there were some commodities which we had to handle at a figure which would yield us a profit over our transportation cost.

Q. You are distinguishing between transportation cost and general cost, are you?

A. Yes, sir.

Q. Have you any statistics of your transportation cost?

A. Only in a general way.

Q. On all of your commodities as a whole, isn't it?

A. Yes.

Q. You have no statistics on the transportation cost of lumber or grain, have you?

A. No, sir, any more than we have actual statistics on any given commodity for our entire cost.

Q. I believe you stated that the Interstate Commerce Commission after a thorough investigation had approved of this zone basis on lumber rates?

3918 A. Yes, sir.

Q. Isn't it a fact that the Interstate Commerce Commission has recently directed your road to cancel all of its division sheets on lumber with all connecting roads, and then temporarily held up that order to enable each road to appear before the Commission and ask for a division?

A. We do not know exactly what they have done, to be perfectly frank with you.

Q. You know they did order you to cancel all of them?

A. No, sir, they did not.

Q. Didn't they order you to cancel all of them?

A. No, sir.

Q. And then suspend that order until January?

A. No. sir

Q. What did they do, Mr. Perkins?

A. They issued an opinion. The Commission has never made an order in the case; we have no order at all from the Commission

for the cancellation of the tap line division. But they did deliver an opinion that the giving of divisions to tap lines was in the nature of rebates, and that tap lines, although they had incorporated themselves as common carriers, were not in fact common carriers.

Q. Didn't they order a cancellation of all those divisions in the Southwest?

A. No, sir. They simply made an opinion. If you read that opinion you will find there is no order in it at all. They
3919 have simply given this opinion, that that was an illegal practice. And they have indicated that unless the roads did cancel them there would probably be some prosecutions. And the roads have felt it necessary to cancel them, to get in the clear.

Q. Have they done so?

A. We canceled them and then under order of the Commission they have been reinstated until January 5th next.

Q. Mr. Perkins, this bridge toll paid at Memphis goes to the road that owns that bridge, doesn't it?

A. It goes to the Bridge Company.

Q. You get no part of it?

A. Not that I know of.

Q. When you fixed the Arkansas rates out of Memphis on the Commission's tariff you fixed it on the Commission's tariff plus the bridge toll; you fixed it on the Commission's rate itself so far as the revenue to your Company was concerned?

A. We fixed it on what we were obliged to fix it on. We did not have very much voice in the fixing in that case.

Q. That is not an answer to my question. It is a fact that you fixed it so far as revenue was concerned on the Commission's rate, didn't you?

A. I do not think that is a fair statement of the facts. We fixed it without any relation to revenue or anything else. We fixed it on the tariffs made by the Commission. If the Commission fixed
3920 a rate that did not pay revenue it would have been fixed on that same basis, probably because we could not get higher.

Q. That Commission tariff was in effect at the time you fixed it, wasn't it?

A. No, sir.

Q. When was it fixed?

A. It was fixed before there was any Commission in Arkansas.

Q. And continued after there was one?

A. Yes, sir.

Q. When you adapted it to the Commission rate, so far as revenue was concerned, you fixed your Memphis rates on the Commission rates, didn't you?

A. No so far as revenue was concerned, no, sir. We fixed it on the bare facts that that was the rate. Those were the conditions that made it, regardless of what the revenue was.

Q. The result would be that so far as revenue was concerned you fixed it on the Arkansas Commission rate?

A. The result so far as anything was concerned was that we fixed it on the Commission's rate, revenue or lack of revenue, either one.

Q. This is the point. The amount of revenue you receive from that Memphis rate was the amount of revenue which was fixed by the Commission's tariff, wasn't it?

3921 A. That was the result, but that was not the basis.

Q. It is the result I am asking about. That is what you did?

A. That was the result of it, yes.

Q. Did you consider that was paying you a profit, or were you making those shipments at a loss?

A. I do not know that that has ever been figured out.

Q. You do not know?

A. I never figured on that.

Q. You did not consider a profit on that at all?

A. We could not.

Q. You just put those rates in there regardless of whether they made a profit or a loss?

A. Just the same as we operate in Arkansas, whether we make a profit or a loss. The rates control the situation.

Q. Isn't it a fact you made some rates out of Memphis into Arkansas at less than the Commission's rates?

A. Less than the Commission's mileage?

Q. Yes.

A. I think that is correct, yes.

Q. Did you make those regardless of whether you would make a profit or loss upon them?

A. We made those subject to the understanding which was had with the City of Memphis as applied to the Arkansas local adjustment.

Q. That does not answer the question. Did you put in

3922 those rates regardless of whether there was a profit or a loss on them?

A. Well, I should say not. I was not with the road at that time, but I would say not.

Q. Why not?

A. I could not answer why not.

Q. Mr. Perkins, I do not quite understand this statement in your testimony at page R 23:

"In cases where the interstate rates are shown to be the same to the points mentioned in the chart, the Memphis to Little Rock rate has been applied as a minimum, these minimum figures applying only to the stations directly South and West of Little Rock, which it will be seen were selected by the State to disprove our basis."

What do you mean by that?

A. I mean that you have selected a group of stations to which, on account of the conditions which I have mentioned, we have in one or two cases a blanket basis of rates; and you picked out that as about the only place you could find in Arkansas to prove or disprove our general theory.

Q. What do you mean by your "general theory"?

A. The relation as between state and interstate rates.

Q. What relation? Cost relation, trade relation, or political relation?

A. The relation of the rates in and of themselves.

Q. What do you mean by the relation of the rates in and of themselves?

A. The relation of one rate to another rate.

3923 Q. Do you mean the proportion that one rate will bear to another one?

A. I mean the bearing which one rate has on another rate, as a matter of fact.

Q. Control, you would be more apt to say—the control of one rate over another one, rather than the relation?

A. Yes, sir.

Q. That is what you mean by that statement?

A. I think the word relation defines it better.

Q. You are discussing there the relation of the effect of one rate on another.

A. The effect of the relation of one rate to another naturally affects the two, yes.

Q. You take the rates in Arkansas that are less than the Commission's rates and what would you say as to that relation or control of the Commission's rate as to them?

A. The basis which I outlined yesterday as governing that part of our line as applied to state rates brought about that result at that time.

Q. That might bring it to the State level, but how could that bring it below the State level?

A. For the reason that in that particular case we used a minimum figure, which was the Memphis to Little Rock rate, 70 cents first class.

Q. On account of commercial conditions?

A. Yes.

3924 Q. I believe Mr. Bragg gave instances of the Memphis interstate rate being less than the state rate to points on the White River Branch and probably other points: do you recall that testimony?

A. Yes, sir.

Q. It was commercial conditions on that line that brought those rates down under the Commission's rates?

A. No, sir.

Q. What was it?

A. Competitive conditions.

Q. What is the distinction you make between commercial and competitive conditions?

A. A competitive condition is one that is generally brought about by meeting the competition of some other line, say a long line meeting the competition of a short line. A commercial condition is more of a trade condition.

Q. And this was a commercial condition in Memphis that fixed that scale; and it was a competitive condition on the White River Branch that brought those rates to the Arkansas Commission's scale?

A. Yes, sir. I can explain it if you wish the explanation of it.

Q. I do not care anything about it, but I just want the facts. However, I have no objection to the explanation if you wish to make one.

3925 A. Our White River Division runs in a roundabout way from Memphis through Arkansas to Springfield and thence North. The Frisco has a direct line to Springfield. The Frisco for some reason, I do not know just what, have applied low rates to Springfield and that immediate territory. Of course they are very much shorter than we are and we have to meet that condition and that has brought our rates to a very much lower basis in that particular territory than we would apply if those conditions were not there.

Q. Then you had to bring your cost, reflected in your rate, to the level of the Frisco's cost, reflected in its rate from Springfield to those points?

A. We probably had to take a less profit then the Frisco did, as they had a shorter route to that territory.

Q. You think you made a profit on those shipments to the White River Branch?

A. Probably.

Q. You think you can make a profit on shipping goods at less than the Arkansas Commission's rates?

A. We made a profit over and above our transportation cost, but I do not say what we made a profit over and above our entire cost. I do not think we did.

Q. At page R 19 of your testimony you were speaking of the shipments to Texas points, and you said:

"In other words, the Texas State rates make the rates on the articles mentioned to these points."

3926 Then the relation, as you used the term relation, between state and interstate rates would be the relation between the Texas State rates and your interstate rates, wouldn't it?

A. In that particular case, yes.

Redirect examination.

By Mr. MOORE:

Q. While on that subject I wish you would take Exhibit F, Mr. Perkins, and point out those conditions. That is to say, where the Commission's rate is less and where it is higher than the interstate rate from Memphis to White River points, and explain the reasons for the interstate rates being lower in the instances where they are.

A. This Exhibit F seems to be a comparison of rates to Memphis from points on the White River Branch on the Iron Mountain, as against rates for an equal distance under the Commission's tariff No. 3, where on a distance of 172 miles the rate from Memphis is 69 cents as against the Commission's tariff 66 cents on first class.

Q. And second class the same?

A. Yes sir, on second class the rates are the same.

On third class the rate from Memphis is 47 cents as against 51 cents, or 4 cents lower.

3927 On fourth class they are the same.

On fifth class they are the same.

Making only one class, and that the third class, where they are lower.

For 184 miles the interstate rate is 70 cents as against 68 cents for the state rate.

Second class is 59 cents as against 61 cents for the state rate, or 2 cents lower.

Third class is 47 cents as against 52 cents, or 5 cents lower.

Fourth class is 40 cents as against 41 cents, or 1 cent lower.

Fifth class is 30 cents as against 31 cents, or 1 cent lower.

For 201 miles the first class rate is 70 cents as against 74 cents.

Second class rate is 59 cents, as against 66 cents.

Third class rate is 47 cents as against 50 cents.

Fourth class rate is 40 cents, as against 43 cents.

Fifth class rate is 30 cents, as against 32 cents.

For 241 miles the rate is 70 cents, as against 79 cents.

Second class is 59 cents, as against 72 cents.

Third class 47 cents, as against 60 cents.

Fourth class is 40 cents as against 44 cents.

Fifth class is 30 cents as against 34 cents.

3928 Q. In those instances where the interstate rate is higher than the Commission rate it is because of the Frisco being a shorter line and having a shorter haul?

A. It will be noticed that the maximum rate interstate is 70 cents first class,

59 cents second class,

47 cents third class,

44 cents fourth class,

50 cents fifth class.

Those are maximum rates to any of those points from Memphis. That is the Frisco scale, being the short and direct line from Memphis to that territory, which held down our rates at intermediate points via our longer and more roundabout route.

Mr. HILL:

Q. To save coming back to this point, Mr. Perkins, I will ask you one or two questions:

Of those rates you have just quoted, seventy-five per cent of them are lower than the commission rates, are they not?

A. Yes, I should say they are, out of the rates that were mentioned, to a certain degree. Some of them only one cent. Some of them more than one cent.

Q. The Frisco does not reach any of those points.

3929 A. No, not these particular points, but these points are directly intermediate with the territory just beyond that the Frisco does reach.

Q. Springfield is the only town it reaches?

A. No, sir; Springfield, Aurora and Carthage are all right in that same territory. It fixes the entire adjustment in that territory.

Redirect examination.

By Mr. MOORE:

Q. Kansas City is a very large terminal point, is it not, and has a very large terminal service and provisions to meet a large terminal service?

A. Yes, sir.

Q. Is not the cost, per unit, for handling traffic in Kansas City, as low or lower than it would be in smaller terminals like we have in Little Rock, on account of the increased volume of that kind of business at Kansas City and at large terminals of that kind?

A. There is no doubt about that.

Q. You started making a comparison, a while ago, with reference to the cost of transporting low grade commodities that move from zone to zone, such as lumber, between the effect of the rates including all costs inclusive of transportation costs—that is to say, overhead costs, general expenses and things of that sort—with the transportation cost itself:

3930 That is the cost of moving and handling the article, keeping out these overhead expenses?

A. Yes, sir.

Q. You did not quite complete your comparison before some other question was asked you. I wanted to see if I understood your meaning:

While in some of the low grade commodities there may be a rate that would not produce a profit on the entire cost, including that overhead, it would with reference to the cost of transporting that commodity, produce something over the expense of handling it?

A. Yes, sir.

Q. That is what you meant, was it not?

A. Yes, sir, that was what I was trying to explain.

Q. You did not quite complete it. That is why I called your attention to it.

Now, referring to shipments to Texas via St. Louis, from points east, such as Chicago:

I want you to state if there is any difference between the handling of freights that are received from connecting lines and the terminal service that is rendered to shipments to Texas of goods originating at St. Louis?

A. There is a difference, yes, sir.

Q. A shipment of shoes from Chicago, over the Chicago and Alton, to a point in Texas was cited:

Taking that illustration, where would that—what line
3931 would that go on south of St. Louis? Would it cross the river and go on the main line or go down to Thebes and that line east of Mississippi River?

A. It would probably go down to the east side line.

Q. Can you state what the difference in the terminal expense of a shipment originating in St. Louis and the handling of that shipment that is delivered to your company from a connecting line would be?

A. In a general way, yes, sir. It will depend, of course, as to whether you refer to less than carload or to carload shipments.

Q. Take it both ways, then.

A. In the case of a carload shipment the car is sent to us, delivered to us on our transfer track by the connecting line. Picked up there and switched into a through train and goes on on a through waybill from point of origin to destination.

In other words, the waybill is made in Chicago and that document carries it through to destination.

In case of a carload originating in St. Louis proper, a car must be sent to the industry by our switch engine, if the industry is on our line. If it is on the connecting line we pay for that service.

Take an example where the industry is on our line: We set in the car. When that car is loaded we send our switch engine
3932 back and get it. It is taken into our yard and made up into a through train. The shipment is waybilled in the office of our local agent. That clerical service is done which is not done in the case of a through shipment although that, of course, being considerably more expensive from every standpoint than the case of a through shipment.

Practically the same thing is true to a different degree in the case of a less than carload shipment. A package of shoes coming from Chicago would be handled in one of our through package cars from Chicago to Texas. That car would be delivered to us on our transfer and the car goes right through and with it the package of shoes, on the through way-bill; whereas in the case of a package of shoes delivered to us for shipment at St. Louis, the shipment is delivered at our freight station; handled by our truckers and put into the proper car at the proper place for unloading, all of which, of course, is an expense. That car then is switched out and put into our through train. The waybill is made in our local office in St. Louis in the same manner that the waybill for the carload shipment was made.

Recross-examination.

By Mr. HILL:

Q. Did you ever have any experience in the terminal yards here in St. Louis?

A. No, sir.

3933 Q. Are the conditions you have just explained actual or ideal?

A. What conditions do you refer to, as to the handling of shipments?

Q. Yes.

A. Those are actual conditions, regardless of to what points they go through.

Q. Those are rather ideal conditions, those that should be, rather than those that are?

A. No, those are necessary conditions.

Q. You have had no experience: you don't know whether they are practiced according to that theory or not, do you?

A. That is the way shipments are handled generally at all terminals.

Q. It seems, then, it would be more expensive here than it would be in East St. Louis?

A. In what way? I did not testify to any facts that St. Louis was any more expensive than East St. Louis.

Q. Would not that be the result of your testimony about that?

A. No, sir.

Q. I would not make any difference whether it went down the east side line or on the main line this side, so far as the expense of terminal is concerned?

A. Only so far as the terminal expense going across the bridge is concerned.

3934 Q. You have to cross the river down at Thebes Bridge too, don't you?

A. Yes. We are part owner in the Thebes Bridge.

Q. But you are supposed to earn some interest on your investment, are you not?

A. Certainly.

Q. That has to be taken care of as well as pay the other bridge here, has it not?

A. It has to be taken care of, yes, but then, naturally we can operate cheaper over our own property than we can over somebody else's property.

Q. You have an interest in the bridge here, have you not?

A. I don't know whether we have or not, to tell you the truth, Judge.

Q. You don't know whether you can operate cheaper over a bridge which you have an interest in already, than a bridge where you have none?

A. I know there is a tax here, but whether we get any of it back here, I don't know.

Q. Do you think the terminal cost in Little Rock is as great as it is in St. Louis?

A. I should say it is greater.

Q. Per ton?

A. Yes, sir.

Q. How about the terminal cost at some little station say

3935 Newport or Malvern?

A. I should say that would be greater.

Q. Greater than it would in St. Louis?

A. Yes, sir.

Q. You explained that you have two ideas of cost, one the cost of transportation and another of the investment also: which are you referring to when you are comparing St. Louis terminal with the Malvern terminal?

Mr. MOORE: What do you mean by "investment"? Do you mean different between the transportation cost and total general cost?

Mr. HILL: That is the way I understood his remark.

Mr. MOORE: I do not see how you can apply the term "investment" to either one of them.

Mr. HILL (Previous question read; to which counsel adds): I mean by that the total cost in the one instance, including your investment in the terminal, expense of maintaining those terminals, and on the other hand merely the expense of handling a given commodity in the terminal: which are you referring to?

A. I was referring to the actual expense of handling the commodity.

In other words, we handle a very much larger volume of business in St. Louis or Kansas City terminals, of course, than we do in the smaller terminals. Naturally, it costs more per ton to handle them in the smaller terminal.

3936 Q. When you consider the value of the property invested in the terminal in St. Louis, compared with Malvern, you would not say that it costs more to handle a ton of freight in Malvern than it would in St. Louis, would you?

A. I would not say it, perhaps, referring to cost. If I were referring to that feature, I would say that that would be a question of profits there.

Q. You never write in your lexicon the word "losses," do you? It is always a question of profits?

A. We try not to write "losses," Judge.

Q. It seems you have written it rather largely in regard to state business, have you not, in the state case?

A. Probably those are rates beyond our control. I am talking about rates we control.

Q. You control these Memphis rates that you based on——

A. No, sir.

Q. Why not?

A. Because they are controlled by the state rates.

Q. You adopted them voluntarily, did you not?

A. We had to.

Q. Who compelled you to?

A. The rates in themselves.

Q. I thought you said that was due to an agreement with the city of Memphis?

A. To a certain extent it was, yes, sir.

3937 Q. Memphis did not compel you to do it in the sense that the Interstate Commerce Commission would compel you to cancel a tap line or the Arkansas Commission would compel you to haul at a given rate?

A. Yes, as a matter of fact, the Interstate Commerce Commission says—the law now says you cannot exceed a combination of locals. That is one of the controlling facts that make our rates from Memphis to Arkansas as they are.

Q. You say the law says you cannot exceed a combination of locals?

A. Yes, sir.

Q. Where is that?

A. It is in the new law.

Q. That was not the law when we were out here in the winter?

A. No, but it is now, although the same theory was in effect

then as it is today. They made it stronger and put it in the law now.

Mr. HILL: That is all.

J. D. WATSON, a witness of lawful age being duly produced,
3938 sworn and examined testified on behalf of the complainant as follows:

Direct examination.

By Mr. MOORE:

Q. You have been on the stand before?

A. Yes, sir.

Q. You are Assistant General Freight Agent of the St. Louis Southwestern Railroad, I believe?

A. Yes, sir.

Q. Mr. Bragg, a witness on the part of the state, in speaking of the differentials in favor of St. Louis and other points over St. Louis testified that the same basis was closely followed in making interstate rates to interior or local points in Arkansas, using Little Rock as the hub or basing point in that system of rates:

I wish you would state if the length of haul affected that system of rates and if so in what way?

A. The length of haul affected all the rates to Arkansas, whether they were based upon differentials; upon arbitrary over the state rate; upon a combination through the junction point within the state, or upon a differential basis as to destination.

3939 The method of arriving at the rates from the point of origin was an arbitrary adjustment over Memphis, and in order to make that clear as to the rates to Little Rock and Pine Bluff, I have prepared a small exhibit which will clearly show the difference as between Memphis, Cairo, St. Louis and Kansas City, to Little Rock and Pine Bluff.

These differentials were used in making the rates to Little Rock and Pine Bluff and points based thereon; the rates to the points beyond Little Rock and Pine Bluff being adjusted either by combination or differential over the Little Rock rates, thus preserving the length of haul both as to origin and destination as a controlling factor in making the rate.

The exhibit just referred to is marked "Complainant's Exhibit 50, J. D. Watson, 10/7/10 M. J. C." and is in the words and figures following to-wit:

Exhibit 50, see Volume 8, page 5679.

3940 Q. Go ahead with your statement.

A. I have completed that statement in connection with that exhibit.

Q. Mr. Bee, a witness introduced by the state, stated that there is no relation whatever between state and interstate rates because of the difference in the haul of the two classes of business:

I wish you would state what you think about that and if the difference in the length of haul destroys that relation?

A. The difference in the length of haul could not destroy the relation as between state and interstate rates for the reason that the state rate in Arkansas to a controlling extent bases the interstate rate.

In the case of the distance referred to in Mr. Bee's testimony, St. Louis 500 and some odd miles, as against 50 miles within the state, the relation was still there, but it would require a rate man to check that relation to show what the relation really was and how the one rate affected the other, or would affect the other, but the difference in the distance as stated by Mr. Bee, would make it difficult for him to understand from the railroad's record just where the relation lies.

There is a very clear relation as between all state rates and all interstate rates operating into the same territory. That is pretty well shown in the testimony in regard to the sugar rate in Arkansas.

The sugar rate from Helena to various points in the state of
3941 Arkansas was fixed upon a maximum basis of 13 cents. That added to the rate to Helena from New Orleans, made the rate from New Orleans to the various points in Arkansas, the maximum rate being 25c., which was the exact Helena combination.

That is also shown to a very marked extent in all of the adjustments in the state of Arkansas.

Our adjustments in the territory south of Pine Bluff is probably one of the best examples of this.

We had no rails of our own into Memphis and the rate from West Memphis to our territory did not necessarily force us to apply the West Memphis rate plus the bridge, but the reduction in the rate from Pine Bluff—taking the rate that was then in effect to Pine Bluff—made it necessary for us to reduce the rate from Memphis to the stations involved south of Pine Bluff, and I have prepared an exhibit which will show without an endless amount of detail these differences and the reductions which were caused in our rates from Memphis by the Arkansas Commission adjustment.

In making this exhibit I have selected the commodities that are moving commodities, ones that amount to something, and have shown in the column numbered one, the rates that were in effect from Memphis to these stations when the Arkansas Commission Standard Distance Tariff was made effective.

In column numbered two I have shown the rates as readjusted to the Arkansas Commission basis, which became effective
3942 September 6, 1900.

In the column numbered three I have shown the reductions which were caused by this readjustment.

In referring to the commodities I have selected such commodities as wire and nails, canned goods, packing house products, salt, and the commodity rate on mattresses, less than carload, and spring beds set up, less than carload.

A glaring example of this reduction would be the rate to say Stephens, Arkansas, on the spring beds set up.

The rate in effect prior to the Arkansas Commission basis was $1.96 per hundred pounds. Effective with the readjustment incident to the Arkansas State rate, the rate becomes 93½ cents or a reduction of $1.02½ per hundred pounds, cutting the rate more than one-half in two.

The exhibit last referred to is marked "Complainants Exhibit 51, J. D. Watson, 10/7/10 M. J. C." and is in the words and figures as follows to-wit:

For Exhibit 51, see Volume —, page —.

3943 Q. Did the rate put into effect by the Arkansas Commission render it necessary to make these reductions that are shown in Exhibit 51?

A. It was necessary to do that in order to prevent the movement of the commodities into Pine Bluff and reshipped from Pine Bluff to destination.

I might make a further statement in connection with that exhibit, which will make it probably more clear.

The rates from Memphis to these stations south of Pine Bluff were not compiled in our interstate adjustment on the basis of the Arkansas Commission scale. Had they been the reductions would have been much more severe than is shown.

For example, take canned goods: the maximum rate within the state of Arkansas—which would, of course, cover those distances from Memphis, plus the bridge—would have been 24 cents per hundred pounds.

The rate on canned goods, less than carload, would have been 30 cents per hundred pounds; where, you will find by referring to the statement that our rates on canned goods, carload, under the new adjustment, to Louisville, in the southern portion of the state, was 33 cents per hundred pounds, and less than carload, 41 cents per hundred pounds.

I make that statement so as to indicate to you that we did not observe the Arkansas Commission scale, either one line or two lines, in adjusting our rates into that territory, but were forced on account of the Arkansas Commission scale operated from Pine Bluff
3944 and the low rates into Pine Bluff to adjust our rates to a basis which would approximate the combination of locals.

Q. Were any changes made in the case of the commodity rates that had an influence on that adjustment by the Arkansas Commission scale?

A. The commodity rates that were established by the Arkansas Commission, both carload and less than carload, were a larger list than was operated under the Interstate adjustments and forced the addition of commodity rates, both carload and less than carload, to our commodity list as follows:

Beer, less than carload; barrels, carload; canned goods, carload and less than carload; excelsior, carload; fire-brick, carload; furniture—first, second, and third and fourth classes, Classes A, B and C, with special description for each.

Ice, carload and less than carload; mattresses, carload and less

than carload; spring bed, carload and less than carload; pottery and stoneware, carload.

In addition to establishing these commodities which took the rates out of the class rates and established a special commodity rate thereon, the Commission very materially reduced the then existing commodity rates, both carload and less than carload, by their very low scale within the state.

Q. Independent of the reduction mentioned in your last statement, what effect did the change from class rates to commodity rates have, on the commodities you have enumerated?

3945 A. It reduced the rates very materially.

Q. Do you remember the testimony of Judge Wallace, who was the Chairman of the Commission at the time the first Commission Tariff was put into effect, in which he stated:

"Interstate rates on the Frisco from Missouri and Arkansas points north of Fort Smith and out of Fort Smith were lower (that is, prior to the Commission rates) than Arkansas rates from Fort Smith and north of Fort Smith, and the Fort Smith jobbers could not compete for the business; and a tariff was put in effect by the Commission for the purpose of reversing that order of things."

Do you remember his testimony in that respect?

A. I do.

Q. Do you know anything about that tariff and its effect? Say what you know about it?

A. The knowledge that I have of it is based upon the information I received from the line that was involved, the Frisco, at that particular time, at hearing the discussions before Judge Wallace.

Q. Now, Judge Wallace stated it had that effect: that is to say, that it transferred that trade from Missouri points north of Fort Smith into Fort Smith to enable that town to compete with other points north:

How did it have that effect?

A. That would be the natural effect.

Q. How?

A. For the reason that the rate into Fort Smith plus the rate out, under the very low Arkansas Commission scale covering all the commodities that would necessarily move from Fort Smith

3946 into that territory, would make a lower through rate than the rate into Springfield, which was the point involved, or Joplin, any of the jobbing points in that district, plus the rate from Springfield or Joplin into this territory.

Q. A good deal has been said in this case in regard to certain zones in connection with trans-state business and the rates applicable between points embraced in the territory covered by the zones.

I wish you would state what effect, in your judgment, the development of that character of trans-state business had upon other classes of business and rates that obtained in respect of other classes of business.

A. The more trans-state business you can secure, the larger your volume and the less the cost per unit, trans-state business on account of its length of haul being probably the cheapest traffic you handle.

The rates on the trans-state traffic are usually fixed for you. They are rates in which you have no control, as a general proposition, and it is a question with the carrier in soliciting and securing trans-state traffic to increase that particular class of traffic on the line so as to increase the total tonnage, secure the long haul freight and by that means reduce the cost of handling all other freight within the state, as long as you do not go beyond the capacity of your railroad. Until you do get to the capacity of your railroad that appears to be the proper principle.

3947 Q. Mr. Watson, the state introduced evidence for the purpose of showing that the revenue per ton per mile on your road was 96 per cent more in the month of January, 1909, than it was during a period, comprising the last six months in 1907:

Was this assumed increase brought about by the increase in the state rates?

A. I should say not. The increase in the revenue per ton per mile, which I understand that statement shows can be brought about by various conditions, only one of which is increase in rates. There might be a shifting of tonnage, change in the character of traffic that you handle during this month of January, as compared with the average for the preceding six months. That would be true of both state and interstate.

Q. Is a change in the revenue per ton per mile indicative of a corresponding change in the revenue received for the same period?

A. No, there could be an increase in the revenue per ton per mile and a decrease in the revenue received.

Q. One of the exhibits introduced in this case (filed I think, by Mr. Kimbell) indicates an increase as between the last one-half of the year 1907 and January 1909, of 96% of the revenue per ton per mile:

I wish you would state if, in your judgment, there was that increase in the revenues as compared with the business done in those two periods.

3948 A. I don't believe it could possibly be. I might explain why I think that.

The revenue per ton per mile does not necessarily indicate anything as to the revenue one way or the other.

The higher class of traffic that you handle the more your revenue per ton per mile would be, but if you can increase your tonnage and reduce the character of it—that is, make it a lower character, your revenue per ton per mile would necessarily decrease, while the volume that you would handle at the decrease revenue per ton per mile would still increase your revenue very materially.

Now, I don't believe it would be possible, on the Cotton Belt, for a difference of 96% in the revenue to occur between any two months or between one month and the average for any period, because I don't believe it changes or shifts that much.

3949 Cross-examination.

By Mr. HILL:

Q. I don't know that I got your last answer: Are you questioning the accuracy of Mr. Kimbell's figures, is that the idea?

A. No, sir.

Q. Mr. Kimbell is one of my witnesses and I didn't know whether you were questioning the accuracy of his calculations or not.

A. No, sir, I was not.

Q. But you think that it was the shifting of traffic and not a shifting of rates that produced that strange, abnormal result: is that it?

A. I do, yes sir.

Q. The rates did not have anything to do with it?

A. The rates would not necessarily affect the revenue per ton per mile, to that extent.

Q. I am not saying "necessarily," but did they actually?

A. I can most positively say that it did not, to that extent.

Q. To what extent did it?

A. At the outside, I should say to the extent of fifty per cent. That is, I mean in revenue; not revenue per ton per mile. I am talking about the actual dollars and cents we received for transporting the traffic.

3950 Mr. MOORE:

Q. You mean it would be fifty per cent, or not to exceed fifty per cent?

A. Not to exceed fifty per cent.

Mr. HILL:

Q. Then these rate increases, in your judgment, did not exceed fifty per cent?

A. No; the revenue.

Q. That the revenue produced from your rate increase on state rates did not exceed fifty per cent: is that your answer?

A. No, that is not the answer. You were talking about revenue and now you are talking about rates.

Q. I am talking about revenue produced from that increase of rates.

A. The revenue produced from that increase of rates would be very hard to say unless we had the actual tonnage. I am only comparing actual figures, as I recall them, covering the revenue derived from traffic in January 1909, as compared with revenue derived from the same traffic in 1907 rates, and my recollection is that it is somewhere in the neighborhood of forty-five or fifty per cent; not to exceed fifty per cent.

Q. You mean by that what I mean: that your revenue was increased forty-five or fifty per cent by reason of that increase in state rates?

A. Yes. I will admit it just as you say it.

Q. No, I don't want you to do that, but I want to know whether you believe that to be a fact?

3951 A. That is what I believe to be the fact, as far as applying the increased rates——

Q. From forty-five to fifty per cent, you say?

A. Yes, sir.

Q. How much do you think the revenue was increased in your interstate rates, by reason of having the increased interstate rates that you put in a short time after you increased your state rates?

A. The interstate rates were not adjusted a short time after the state rates were put in. It required some eight or nine months to make the majority of the changes. Some of them are still being made.

Q. I understand that. But you put in a new tariff in December increasing your interstate rates: when did you increase your state rates—the 2nd of November?

A. Yes, sir.

Q. Now, that is the tariff I am talking about. You have changed that after that and are still changing but I think you herctofore testified that the changes after that were not material: do I recall correctly?

A. I don't recall making that statement, because I don't believe I would have made that statement. The rates that you have reference to are to the common points.

Q. What I am talking about is your increase of interstate rates which you made in December, following your increase in your state rates in November, 1908:

3952 How much increase of revenue did that produce, compared with 1907?

A. It would be very difficult to say that, Judge, without an analysis of the movement during that particular period.

Q. Mr. Kimbell's figures showed nine per cent—in round figures; I have forgotten the fraction—on revenue, in interstate, in January.

A. That is revenue per ton per mile.

Q. Yes, on interstate, in January 1909?

A. That condition could have been very readily obtained—

Q. I am not asking that: what I am trying to get at is what was done: how much of that nine per cent per ton, per mile, was due to the increase of interstate rates?

A. I don't believe you can get that information without an analysis of the interstate tonnage handled during that period.

Q. Really you cannot do anything about that increase of revenue per ton, per mile, without that analysis on both sides?

A. I don't think so.

Q. You are only guessing?

A. We are not guessing on that state proposition, for the reason that we got those figures. The State required us to keep them and we know.

Q. You have what figures?

A. The difference between the revenue derived from the

3953 state rates and the revenue derived from the court tariff, and the revenue before the voluntary——

Q. This was before the court tariff went into effect in 1909. The court tariff did not go into effect until the first of June. Have you any figures on that? If you have, I would like to have them.

A. I don't know that we have any figures.

Q. Has your office any figures?

A. I think we can look that up.

Q. Will you undertake to get that for us?

A. I will undertake to ask Mr. Kimbell to get them for you.

Q. I would like to have those very much.

You have not made an estimate on your increased revenue for January, due to an increase of your interstate rates. I would like to have your best estimate on that. You have estimated the state to be from forty-five to fifty per cent. Now, I want to know what you think the interstate was.

A. I have estimated the state from my recollection of the results. I cannot remember the interstate because I haven't any recollection of the results, because we haven't any results.

Q. What do you think it would be——

A. I don't think there is any appreciable increase in the state rates that would appear in the revenue in January 1909.

3954 Q. I am talking about the interstate?

A. I should have said interstate. I don't believe there is any appreciable change in the interstate rates that would show in the revenue for January, 1909.

Q. Then you made an increase, according to your estimates, in the state rate of from forty-five to fifty per cent, without any appreciable increase in your interstate rates?

A. During January, 1909, you mean?

Q. Yes.

A. During January, 1909, the new state rates were in effect; the new rates established by the railroads and the Commission for application in the state, were in effect, and there had not been sufficient time allowed to permit the railroads to re-adjust their interstate rates.

Q. Why not? You got your injunction from Judge Van Devanter about the 1st of September and you required only thirty days in which to put in a new tariff?

A. It requires somewhat longer than that to put in a tariff. We tried to put in the state tariff effective October 15——

Q. You put in your tariff on the interstate rates in January?

A. Not all of the interstate rates; Arkansas common points, and only a portion of the rates to the Arkansas common points. You cannot adjust them all together. The rate fabric is one that you cannot possibly re-adjust from one end of the state to the other, at one time.

3955 Q. How long does it usually take to do that?

A. A pretty fair example was this. Here is a case where we had to reduce our rates, shown by that exhibit (indicating), which required from April to September to prepare those figures and put them into shape.

Q. During such period as that, what would you say was the relation between your state and interstate rates?

A. During what period?

Q. Such a period as you are describing: when you put your state rates in and it takes a long time to put in your interstate rates?

A. They are in a very bad condition; as far as the relation is concerned, there is no relation. You have destroyed the relation.

Q. There is no relation there at all?

A. Not until such time as the rates are adjusted.

Q. What do you mean by "relation"?

A. I mean that the state rates base the interstate rates.

Q. Control them, in other words?

A. Yes, sir, control them.

Q. When you have been referring in your testimony to relation between state and interstate rates, you are not referring to the cost relation of carrying those commodities, state and interstate, but you are referring, as I understand you, to the effect that the state rate has on the interstate rate: is not that true?

3956 A. That is true; yes. Both sections of the question are true.

Q. Both of them?

A. Yes. There is a cost relation always, regardless of what the scale rates may be.

Q. What is that cost relation?

A. That is brought about by the adjustment produced by the classification.

Q. Do you know the cost of carrying any commodity, Mr. Watson?

A. The actual cost of carrying any one commodity?

Q. Yes.

A. No. I don't think anyone does.

Q. You cannot very well adjust the cost relation without having any statistics?

A. Yes; that is what we prepare the Classification for. That is exactly the object of the classification.

Q. The classification is the only cost relation that there is in fixing the adjustment between state and interstate, is it not?

A. I don't believe I quite catch the object of your question.

Q. Well, no matter what the object of it is, if you understand the question.

A. I only want to answer it properly. I can answer it two ways.

3957 Q. Answer it both ways.

A. The cost relation as between state and interstate rates is the classification. That is the cost relation.

Now, there is another cost relation as between state and interstate rates and that is where your state rate becomes so low that the railroads do not feel they can meet that low rates and carry the traffic.

Q. Then they just go out of business?

A. Yes; as the Cotton Belt has done in quite a number of cases.

There is quite a little business to Little Rock based on state rates, that they don't handle.

Q. The only way you can adjust any cost relation between state and interstate rates, so far as you know, is through the classification of the various commodities and classes?

A. That is the method of arriving at the cost relation.

Q. So far as you know, that is the only method?

A. It is the only method so far as the class rates are concerned, yes, but there is quite a large list of commodity rates.

Q. How do you adjust them?

A. Those are adjusted as near as we can do so.

Q. Just by intuition?

A. And judgment—"guess" I believe you call it.

Q. Mr. J. M. Johnson called it "guess." I did not call it that.

You have the average cost per ton per mile on all your
3958 commodities, and then when you have that, in fixing rates you exercise your judgment (or, as Mr. J. M. Johnson says, exercise your Guessing power) to determine what the rate ought to be?

A. No, not altogether. To determine what the minimum rate ought to be, but not what the rate ought to be, because there are a great many other conditions that fix that rate.

Q. But that is the only way you get at a cost relation—the way in which I have indicated?

A. That is the only way you prevent yourself from handling traffic which you should not handle.

Q. Your first exhibit, number 50, gives the class rates to Little Rock and Pine Bluff from Memphis, Cairo; Memphis-St. Louis; and Memphis-Kansas City——

A. Maybe I can make a statement that will explain.

The exhibit only shows the difference between the rate from Memphis to Little Rock and Pine Bluff, and the rate from Cairo, St. Louis and Kansas City to Little Rock and Pine Bluff, showing the "differential" that has been so often used in the discussions in regard to this matter.

Q. This (indicating on exhibit) should be "differential" here, instead of "difference"?

A. No, that is actual difference. Those are the differences in rates——

Q. Is the "difference" and "differential" the same thing?

3959 A. The "difference" and "differentials" are the same.

Q. Do I understand you to say that you put this in to show that so far as the rates are concerned, that the length of haul was observed?

A. That the length of haul is observed. That the differential which is used in making the relation, has a relation to the length of haul. The further you go from Little Rock the higher the rate becomes.

Q. You have got Little Rock and Pine Bluff down here at the same rate: is that true?

A. They do take the same rate.

Q. There is a difference in the haul there?
A. Yes, sir.
Q. You did not observe the difference in the length of haul?
A. It is not so great.
Q. It may be little, but it is there.
A. The difference in the haul, between Little Rock and Pine Bluff, I would say, taking the average Iron Mountain one way and the Cotton Belt the other, is probably fifteen miles.
Q. What is the rate on first-class goods, from Memphis to Cairo?
A. From Memphis to Cairo?
Q. Yes.

A. I couldn't tell you, offhanded. It is something about
3960 fifty cents per hundred pounds.

Q. You make a difference on this of twenty cents, running from Cairo, through Memphis, to Little Rock and Pine Bluff?
A. We haul it direct from Cairo to Pine Bluff, not through Memphis.
Q. Take it from St. Louis?
A. We would not haul it from Memphis to St. Louis.
Q. No; I mean, take the St. Louis rate instead of the Memphis rate. You have the St. Louis rate here, to Little Rock and Pine Bluff:
What would be the difference on that haul to Pine Bluff? Forty-five miles, would it not?
A. The difference between St. Louis and Cairo to Pine Bluff and Little Rock?
Q. No; St. Louis to Little Rock and Pine Bluff; same rate; on a difference of forty-five miles?
A. That is one of the conditions brought about by something else besides cost of service——
Q. I am not talking about that: I am trying to find out the difference.
A. The Iron Mountain distance from St. Louis to Little Rock is 345 miles.
Q. And what is it to Pine Bluff?
A. Forty-two miles further, on the Iron Mountain. Our distance would be 402 miles.

Q. How much distance is disregarded, then, in those
3961 rates?

A. How much is distance disregarded in those rates?
Q. Yes.
A. The rate to Little Rock and to Pine Bluff being the same from Memphis, the rate from St. Louis is differentially adjusted to the Memphis rate.
Q. I am trying to get at how much distance is disregarded on the same rate from St. Louis to Little Rock and Pine Bluff?
A. You mean by the Cotton Belt?
Q. By both of them.
A. By the Iron Mountain the difference in distance is 42 miles. Via the Cotton Belt the difference in distance is in favor of Pine Bluff about 30 miles.

Q. One road disregards 30 miles and the other disregards 32 miles?

A. One road disregards 30 miles to meet the competition of the other road at Little Rock, and the other road disregards 42 miles to meet the competition at Pine Bluff.

Q. This table, then, does not prove that you have regarded distance very strongly in fixing these rates, does it?

A. It proves that the difference in the distance is a factor in making the rate from St. Louis, Cairo and Kansas City to Arkansas points, as compared with rates from Memphis upon which they base.

3962 Q. I believe you gave us some examples the last time you were on the stand, about rates from St. Louis to Paragould, and carrying the stuff right on through Paragould to Memphis:

Distance was disregarded in that, was it not?

A. Yes, sir.

Q. Did you not also give some examples of traffic being carried right through Arkansas to New Orleans for less than if that same traffic was stopped in Arkansas and delivered there?

A. Yes, sir.

Q. Also to Helena and Arkansas City?

A. Yes, sir.

Q. In all those cases distance was disregarded, was it not?

A. Distance would not be the controlling factor. It is not disregarded entirely.

Q. Would you not say it was disregarded when you charge more to take some stuff to Pine Bluff than you would to take it to New Orleans, carrying it several miles further?

A. The same competitive conditions did not exist at Paragould that existed at Memphis. That is what caused that difference in adjustment.

Q. The facts are that distance was disregarded in all those New Orleans rates as compared with hauling the same stuff in Arkansas?

A. I can't agree with you.

Q. How much of a lopping off of distance would you re-

3963 quire, before you would say distance was disregarded?

A. If you will select rates that are governed by the same conditions in other respects, you will find that the distance feature is always borne in mind.

Q. I am not arguing that you have committed a sin in doing that, but I am just trying to get at the basis.

Take pianos, from St. Louis, on the Iron Mountain to Little Rock, and then on through Little Rock to New Orleans; what is the difference in the rates?

A. I don't recall the figures now. I understand the rate to Little Rock is higher than the rate to New Orleans. It is probably about the same on pianos.

Q. Then you would have to haul them all the way from Little Rock to New Orleans, and get less money for hauling them to New Orleans than you would for delivering them at Little Rock?

A. Or stay out of the business entirely.

Q. That is the situation?

A. Yes, sir.

Q. You say you do not regard a rate like as disregarding distance?

A. I don't, no; for the reason that that particular traffic is traffic that you must participate in on the basis that you can get it or do without it entirely, and I don't believe that the difference in the cost of handling that particular traffic would justify staying out of it.

3964 Q. That is a very good reason for going into it and I would agree with you if you would say that distance ought to be disregarded.

A. Maybe I can understand you better now. It is disregarded to that extent.

Q. As a matter of fact, it is disregarded and you think it ought to be under such circumstances as you have stated?

A. Yes, but you are comparing one rate governed by one condition, with another rate governed by another condition, and in regard to those particular rates you must disregard——

Q. I would not for a moment attempt to argue with you, but I am trying to show that it was disregarded.

A. It is disregarded.

Q. Now, take the citrus fruit rates from California to Arkansas, and on through Arkansas to New York and Boston:

Distance is disregarded in those rates, is it not?

A. That is a blanket or zone rate, yes.

Q. In which distance is absolutely disregarded, carrying the same thing, for varying distances of more than one thousand miles in the zone?

A. Yes, sir.

Q. Now, Mr. Watson, I want a little explanation of this exhibit number 51:

Take your first column and first item, which is "Canned goods, carload":

3965 The rate in effect on April 10, 1900, to the first station was 30 cents. Then after the Commission tariff went into effect you reduced that to 24 cents:

What does that prove?

A. It proves that if the Commission tariff had not been made effective we would still be making six cents per 100 pounds more than we were after the Commission tariff became effective.

Q. Then your Commission tariff reduced all your interstate rates to the amounts shown in the third column of this exhibit?

Mr. MOORE: Not to the amount; by the amount.

A. By the amount.

Mr. HILL:

Q. Yes, that is right. Shown in the third column of each one of these separate——

A. Yes, sir.

Q. You do not mean that your interstate rates became the same

as your commission rates, but this was the effect that the Commission rates had on it: is not that true?

A. Yes, sir.

Q. What was the Commission rate on that first item you have?

A. The distance from Memphis to Sorrels is 160 miles. The Commission rate on canned goods, carload, for 160 miles, would have been 16 cents.

Q. You made it 24 cents?

3966 A. We made it 24 cents.

Q. Now, is that a fair example of the way everything runs in this Exhibit number 51?

A. That would not be a fair example because it does not show a sufficient amount of difference. By going down that column you will find some places where it reduced the rate sixty per cent.

Q. Let us take some other. I want the actual situation about this.

A. If you will not use the first distance, but the distance down about Eagle Mills, for example——

Q. I see Fordyce down here and I know Fordyce is a pretty good size town.

A. That is a fair example, but I just wanted to get the average distance.

Fordyce is 40 miles south of Pine Bluff. Eagle Mills is quite a little town.

Q. I don't know Eagle Mills, but let us take Fordyce: the old rate was 44 cents, but after the Commission rate went into effect it was 28 cents:

What was the Commission rate for that corresponding haul?

A. The distance from Memphis to Fordyce is 195 miles, and the rate for 195 miles, under the Commission tariff, would be 16 cents.

Q. And you reduced it to 28 cents?

3967 A. We reduced it to 28 cents.

Q. As against 44 cents?

A. Yes, sir.

Q. Now take your Eagle Mills that you want to compare with.

A. Sixty miles, and the rate shown here, prior to the Commission tariff, was fifty cents; subsequent to the Commission tariff, thirty cents.

The distance from Memphis to Eagle Mills is 215 miles, and the Commission tariff rate for that distance, on canned goods, carload, would have been 17 cents per hundred pounds.

Q. Now, is that a fair example of the rates which prevailed, interstate, as against prevailing Commission rates?

A. Yes, that is a fair example to that particular territory.

Now, if you will go down to Lewisville, further down——

Q. Wait a moment.

Your interstate rate on that canned goods movement there was 30 cents: for a similar movement of canned goods, under the Commission rate, a state movement, the rate was 17 cents?

A. Yes, sir.

Q. Going back to Fordyce: your interstate rate was 28 cents and the Commission rate 16 cents?

A. Yes, sir.

Q. Going back to Sorrell: your interstate revenue was 24 cents, and your Commission rate, I believe, was 16 cents?

A. Yes, 16 cents.

3968 Q. Is that about the proportion that your interstate rates will hold to your state rates?

A. On canned goods, yes.

Q. Well, does that proportion hold good as to these other commodities?

A. No, sir, it does not.

Q. About what proportion?

A. It would be necessary to take each and every rate in order to get that proportion. We could not get a general average on account of the peculiar manner in which this state tariff was constructed. It is different from any other tariff we have got. It was placed on a different basis than any other rate adjustment we had ever seen, or have seen since.

Q. It was a strange and abnormal being?

A. Yes, sir; absolutely. Some of the rates were really ridiculous.

Q. Now take some of these other things as an example: I want something where there is considerable movement.

A. Take the wire and nail movement. There is a pretty good movement of that in carload and less than carload.

Q. Is this wire and nail example taken on the commodity?

A. It is taken upon the commodity description of wire and nails, yes, sir.

Q. Take some point there that you think is fairly representative of the situation we are trying to get at.

3969 A. That is what I tried to explain. There is no point that is fairly representative, for the reason that the scale in the Commission tariff is one that does not follow any regular basis. You have a maximum for three hundred miles which applies, regardless of the distance you handle the shipment over the three hundred miles.

Q. Then you cannot keep up a very good parity between the interstate and the state rate?

A. We did not attempt to do so. The only parity is to prevent the business being consigned to one point and reconsigned from that point at a rate less than our through rate.

Q. You did not attempt to preserve any parity during the existence of the Commission tariff between your interstate rates and the Commission rates themselves?

A. For distance, no.

Q. To illustrate that fact take some point, on wire and nails, where there is considerable movement: You will know best what will illustrate your point.

A. Take Fordyce, the same point you selected before.

Q. There ought to be considerable movement from Memphis to Fordyce on wire and nails.

A. I will say for your information that the American Steel & Wire Company store their wire and nails at Memphis and make their carload and less than carload shipments from that point.

3970 At Fordyce, prior to the Commission tariff, the rate was 36 cents (column 1); subsequent to the Commission tariff it was 20 cents. The reduction was 16 cents.

Q. What would the Commission rate have been on that?

A. The Commission rate from Memphis to Fordyce, on wire and nails, would have been 14 cents; distance, 195 miles.

Q. Then your interstate rate was six cents above the Commission rate?

A. Yes, sir.

Q. Now, take it on wire and nails, less than carload, at the same places: I reckon there is a good movement of that, is there not?

A. Yes, sir.

From Memphis to Fordyce, the rate on wire and nails prior to the Commission rate, was 45 cents; subsequent to the Commission rate it was 31 cents; a reduction of 14 cents per hundred pounds.

The rate from Memphis to Fordyce, a distance of 195 miles, would have been under the Commission tariff, 20 cents.

Q. There is a difference of 11 cents, then, between your interstate rate and the Commission rate on that same movement?

A. Yes, sir.

Q. Those are pretty long hauls for the Commission rate. Take some point of about an average state movement, say fifty miles, and make some comparisons there.

3971 A. The Commission rate on wire and nails, for a distance of fifty miles, carload, was eight cents; less than carload, 14 cents.

Q. Pick out some station here that would be covered by that rate.

A. You cannot, because the distance from Memphis to——Sorrells is the first station, a distance of 165 miles.

Q. Have you anything in this table that you can make a comparison with—I believe it is in evidence here that on your road the average state haul is something like fifty miles: I have forgotten the exact figures.

A. Thirty-four miles.

Q. If you are certain about that we will go ahead.

A. No, I am not certain, but that is my recollection of the January, 1909, exhibit.

Q. I was thinking of the six months' exhibit. (After examining record.) Well, it is about 41 miles. That seems to be the average haul on your road for state business. Take a distance of about forty-one miles.

A. Say forty-one miles. That is approximate. From Pine Bluff to Fordyce the rate would be the forty-mile rate on wire and nails, carload, eight cents; less than carload, fourteen cents.

Q. That is the Commission rate?

A. Yes. The Commission rate would be, for 155 miles, the distance from Memphis to Pine Bluff, on wire and nails, carload, 14

cents; less than carload, 20 cents. That would make your
3972 through rate from Memphis to Fordyce based on a combination of locals through Pine Bluff, using the Arkansas distance tariff rate for both factors, 22 cents, carload; less than carload, 34 cents.

Q. I thought you said eight and twenty, did you not?

A. Eight and fourteen was the first, and fourteen and twenty is the second; it would be twenty and thirty-four——

Q. That would be the Commission rate?

A. That would be using the Commission rate as a basis to Pine Bluff, and Pine Bluff to Fordyce a combination of locals; using the Commission tariff for both factors would produce that result.

Our rate from Memphis to that particular point, Fordyce, subsequent to the Commission tariffff was: carloads, 20 cents; less than carloads, 31 cents.

Q. Still that does not get at the point I am asking about: What I want to get at is this:

The evidence here shows that the average movement on your road would be about forty-one miles, and on the Iron Mountain about seventy-two miles:

There is where the real test of the Commission rate would be, on the average state movement. There were not many movements for these long distances, under the Commission rate.

Have you any case where your interstate rates compare with 41 and 72 miles?

A. No, for the reason that the distance from Memphis to our junction point with the lines operating out of Memphis, is
3973 sixty miles. Therefore we have no rates for a distance from Memphis less than sixty miles.

Q. Then your table is comparing actual interstate movements with comparatively few, if any, state movements?

A. No, our table is actually showing the result of the Arkansas standard freight distance tariff upon our interstate rate adjustment.

Q. But when I asked you to compare it, as you have been doing with the Commission rate, it really had no basis to compare the real movement.

The real movement under the Commission rate would not be for these distances that you have been giving?

A. No, it would not.

Q. So these tables would not serve to compare your interstate rate, under which your interstate stuff actually goes, with the state rate, under which the stuff actually goes?

A. No, sir.

Q. This is really illustrating what we might call the practical effect of the Standard Distance Tariff on your interstate rates?

A. I cannot agree with you on that work "practical". It illustrates the actual effect of the Standard Distance Tariff on our adjustment.

In other words, had we not changed that adjustment as we did change it, there would have been no movement from Memphis to

Fordyce at all. The movement would have been from
3974 Memphis to Pine Bluff, at the interstate rate, and from Pine Bluff to Fordyce at the state rate, and the result would have been that instead of handling through traffic from Memphis to stations south of Pine Bluff, we would have handled it out of Pine Bluff.

Q. You had to meet a condition where a combination of other rates would let the stuff in cheaper than what your existing rates were?

A. Not a combination of other rates. A combination of the rates to Pine Bluffff, plus the Commission rates beyond.

Q. That is a combination of other rates.

A. I don't know just how you can call it that——

Q. I thought you were talking about both the Commission rates and your interstate rates; that would be a factor of both. It would be an interstate rate from Memphis to Pine Bluff.

A. Yes, from Memphis to Pine Bluff.

Q. And a state rate from Pine Bluff to Fordyce?

A. Yes, from Pine Bluff to Fordyce.

Q. I believe you stated a while ago that you did not have any control over these trans-state rates?

A. Over a majority of the trans-state rates, I think I said.

Q. That is heavy traffic, like lumber and grain. Your road has no control over——

A. No, we are the intermediate carrier.

Q. You are the intermediate carrier. You have to take
3975 what the other fellows give you, or not take the stuff?

A. Exactly.

Q. That is a pretty large traffic on your road, too, is it not?

A. It is and we hope to increase it.

Q. I don't know whether you have a "bridge" on your road or not; have you?

A. I don't know anything about that "bridge", Judge. I didn't have anything to do with that "bridge".

Q. By having no control, you mean by that having no voice in fixing that rate: You do not mean that there is any interstate Commission—or State Commission?

It is fixed by other carriers, and you being the intermediate line, have to take what the other carriers choose to give you?

A. No; what we feel we can afford to haul; not what the other carriers can afford to give us.

Q. You either put in that rate or stay out of the business?

A. That is it.

Q. They cannot compel you to haul it, but they can name the rate for which you will haul it?

A. For which we must haul it.

Q. And then it is up to you whether you will haul it?

A. Yes, sir.

Q. Those rates are very varying, too, are they not?

3976 A. That is a peculiar term to use, Judge. The rates differ.

Q. They fluctuate?

A. No, they don't fluctuate. They are stable.

Q. I did not know any of the rates were stable. I thought that you were changing them.

A. We are, wherever the conditions change; we have to have a new rate or go out of business.

Q. That is fluctuating, is it not?

A. The fluctuations are not as great as that word would indicate.

Q. You say they differ. Probably that is a better word. Your division sheets with the other roads will differ, too, will they not?

A. There is a competition in divisions just the same as in rates, you will understand.

Q. How is that division usually made?

A. That is a very difficult question, because they are not usually made on any fixed scale. There are just as many varying conditions that enter into fixing the divisions as enter into the fixing the rates.

Q. What are the usual bases for fixing the division.

A. I can name some of them to you:

Mileage pro rate; constructive mileage pro rate; rate pro rate; revenue of locals—I could name them to you by the hour.

3977 Q. Those are the principal ones you have named?

A. Yes, sir.

Q. That will make differences as to what your trans-state revenue amounts to, as the different basis is adopted for each rate?

A. That would indicate that you understood my former answer to mean that we had different bases for the same service between different carriers offering the business at the same junction, which is not true.

Q. I did not mean that. I meant the whole body of your trans-state business.

You have different bases to reach your trans-state revenue and they will differ. That is what I mean.

A. It may differ as to service in different directions, but it does not materially differ for the same service, under the same conditions and on the same traffic. But if we were to take a shipment, as an example and to indicate why I am trying to differentiate—if a shipment was offered to us on a point on the Southern Pacific, we would be forced to allow a division that would compensate that line for turning it over to us.

If the same shipment were to originate on the I. & G. N., who have not this long line to New Orleans, the revenue for that line for this service would probably be somewhat less than we would have to allow the Southern Pacific.

Therefore, on the same traffic, from two different points, on two different lines, our revenue from the junction point to
3978 destination or as far as we would handle the traffic, would be different.

Q. Your service would be the same but your revenue would differ: that is the point I am trying to get at, and which I understand is a fact.

A. That as a general statement would not serve, but would have to be confined to the various kinds of traffic.

Q. Have the examples which you have taken up about that in Exhibit 51, fairly indicated the situation which you intend to represent, without going into further detail about it?

A. I don't know what you mean by "fairly" used in that connection, Judge.

The statement as it stands is indicative of the adjustment to the territory covered, and the questions you have asked in connection with the individual stations would indicate the differences at those particular stations, but would indicate the principle to all the stations.

Q. That is what I want to get at: have I asked you enough detail in bringing out these questions about Fordyce and Eagle Mills and these other points that you have taken in detail, to fairly represent, not in dollars and cents, but the principles you are seeking to show by this?

A. Yes, sir.

Q. There is a word that you used there, that I was questioning Mr. Perkins about yesterday: I want to know if you
3979 use it in the same sense that he does, and that is the word "adjustment": what do you mean by rate "adjustment"?

A. That is a term that is used in connection with any body of rates. It is the method of making them; the method of arriving at the figures.

Q. As I understood it, Mr. Perkins said it was a scale; it was the rate itself. It was a term used for the rate itself, or the system of rates.

Is that the way you have used the term?

A. I have used in both senses.

Q. What other sense?

A. Both the senses you have just referred to. One as to the scale itself, which indicates that that is the rate adjustment, meaning handing you a statement of rates or tariff and indicating that is the rate adjustment in that tariff.

The other use of the word "adjustment"—as will be indicated by the verbiage in connection with it, is adjusting one rate to another.

Q. Fitting one to the other.

A. Yes. In other words, this adjustment as a scale is adjusted to the Arkansas rates.

Q. I believe I understand the term now. That is all.

3980 Redirect examination.

By Mr. MOORE:

Q. From what line of road do you reach Memphis?

A. We use the Iron Mountain rails between Fair Oaks and Memphis.

Q. I mean at the time Exhibit 51 was prepared?

A. When Exhibit 51 was made we used the Iron Mountain rails between Fair Oaks and Memphis, under contract.

Q. These rates you set out here in Exhibit 51, represent the rates from Memphis to the points that are mentioned on the two lines of road.

A. No, the points that are mentioned on our line, but they represent the rate from Memphis over the route, via Fair Oaks.

Q. Your Company handles that business in and out of Memphis by using these leased rails?

A. Yes, of the Iron Mountain.

Q. Is there a bridge charge?

A. Yes, there is a bridge charge.

Q. What is that?

A. That varies according to the class commodity.

Q. What is it on Class 1?

A. According to my recollection it is two cents. I would not be sure of that. You mean first-class?

Q. Yes.

A. Five cents.

Mr. HILL:

Q. Has not that been changed? Was it not two cents?

A. My recollection is that it is five cents, less than carload;
3981 and two cents for carload. I only testify from recollection. I cannot state as a fact.

Q. Does your road get any part of that bridge toll or does that go to the bridge Company?

A. It all goes to the bridge Company.

Mr. MOORE:

Q. Are the factors that you referred to a while ago as affecting the rate division between connecting lines, applied to varying conditions that exist on different hauls on different roads?

A. The lengths of the haul and competitive conditions——

Q. You were asked what figured in the division and you spoke of mileage and other factors, a number of which you enumerated:

What I want to know is if those factors operate and apply to the varying conditions as they may arise in different territories, or on different lines, or on all different commodities?

A. They do. Sometimes you will find several of the rules that I have shown in one set of divisions between two carriers.

In other words, the division on one rate will probably be on a mileage pro rate. On another rate, with the same carrier, a constructive pro rate; and another, a revenue pro rate or a rate pro rate.

Q. It depends upon the particular condition that exists as to the subject matter of the arrangement; but those factors are ap-
3982 plied to the varying conditions that may arise: that is what I want to understand?

A. Yes, sir.

Q. You spoke about the increase in revenue on interstate business, as between two periods—January, I believe, and the last half of 1907, and you were asked what the increase in interstate revenue was:

Mr. Bragg testified that there had been some increase in interstate revenue before the increase of the state revenue following the injunctions in these cases in 1907 and again in September, 1908:

Did that affect the ratio of the increase any?

A. It affected the revenue in January, 1909, yes, but to what extent it would be impracticable to say.

Q. I understand that, and you are not attempting to say whether the increase between January, 1909, and the period in 1907 was, either? You don't know?

A. I couldn't possibly say. I might add there, in connection with the testimony of Mr. Bragg, that the changes in rates that were made in the time referred to by Mr. Bragg, are not in any way based upon the state conditions. Those were readjustments of interstate rates which were not materially affected by the state rates.

Q. I want to call your attention to another matter in connection with the relative rates from St. Louis to Pine Bluff and Little
3983 Rock on the Cotton Belt and on the Iron Mountain lines: I believe business from St. Louis to Pine Bluff, on the Iron Mountain, goes through Little Rock, does it not?

A. Yes, sir.

Q. And business to Little Rock, on your line, practically goes through Pine Bluff?

A. It goes to Altheimer, twelve miles north of Pine Bluff.

Q. You, therefore, have the short line from St. Louis to Pine Bluff?

A. No, we haven't a short line from St. Louis to Pine Bluff. On the Iron Mountain the distance to Little Rock is 345 miles, and Little Rock to Pine Bluff is 42 miles, making 387 miles with them, and with us it is 402 miles, the difference being very small—387 miles as against 402.

Q. What affect do those conditions have upon the relation of the rates as fixed on the two roads?

A. The Iron Mountain fixing the rate to Little Rock would make it necessary for us to make the same rate or go out of business.

The distance from Memphis to Pine Bluff, via our line, and Memphis to Little Rock, via the Iron Mountain, is practically the same and the same rates will apply, and the adjustment to Little Rock and Pine Bluff and points taking the same rates from St. Louis, is differentially fixed on Memphis, which would make the rate from St. Louis to Little Rock and Pine Bluff the same.

3984 Q. Comment was made by counsel on this exhibit 51, in regard to its showing no mileage:

The effect that that does have is to show the effect (and that I understand is your purpose in introducing it), that the Commission state rates have upon the interstate rates that were in force on your road at the time the Commission rates were put into effect?

A. That shows the actual effect of the Arkansas state rates upon our interstate rates from Memphis.

In other words, we could not get, after the Arkansas tariff was made effective, the same through rates as were in effect prior to its effective date, for the reasons explained. That is, that the busi-

ness would be consigned to Pine Bluff and re-shipped at a lower through rate.

Recross-examination.

By Mr. HILL:

Q. Mr. Watson, I wish you would take this testimony of Mr. Perkins, which he put in yesterday, setting forth the table of rates from Memphis, on page R-21: that table wherein Mr. Perkins has shown that the rate from Memphis Bridge Junction to various points in Arkansas, is a Memphis rate, plus the bridge toll, and in giving those rates he has put the bridge toll at two cents, which fits his theory that those rates were made on the Arkansas Commission rate, plus the bridge toll:

3985 Now, if the bridge toll is five cents that would not fit with those rates very well, would it?

A. He does not say the bridge toll is two cents. He says the difference is two cents, but it may be possible that the bridge toll is two cents on all classes. My recollection is that it is five cents on less than carloads and two cents on carloads.

Mr. MOORE:

Q. It has been changed since the Commission tariff went into effect?

A. That is my recollection of what it is now. I won't be sure, because it does not figure in our rate adjustment.

Mr. HILL (to Mr. Perkins):

Q. This table, I assume, was intended to represent the situation in 1907, was it not, Mr. Perkins?

Mr. PERKINS:

A. Yes, sir.

Mr. HILL (to the witness, Mr. Watson):

Q. This table shows both carload and less than carload?

A. Yes, it shows the difference to be two cents on all classes.

Q. Mr. Perkins has explained that as being due to the two cents bridge arbitrary: if the bridge arbitrary is five cents on L. C. L., then his theory would not work on this table?

A. Yes, except on the first four classes.

Q. You say on that class it would not work?

A. On the first four classes.

Q. Have you anything that you can turn to, to find out

3986 whether your recollection or his is correct?

A. Not here, but I can get the information and supply it later.

Q. I wish you would.

A. I will do so.

3987 M. L. BYERS, a witness of lawful age, being duly produced, sworn and examined on behalf of the complainants, in rebuttal, testified as follows:

Direct examination.

By Col. J. M. MOORE:

Q. Please state your residence and occupation.

A. I am a resident of St. Louis and my occupation is Chief Engineer, Maintenance of way, of the Missouri Pacific and Iron Mountain System.

Q. How long have you been connected with that system?

A. About six years.

Q. I wish you would state what experience you have had in railroad work?

A. I graduated from the Lehigh University as Civil Engineer in '88 and immediately entered the service of the Pennsylvania Lines west of Pittsburg, as Assistant Engineer in the maintenance of way department; I remained in that capacity on various divisions and in the office of Chief Engineer for about five years.

3988 I was then promoted to be Engineer maintenance of way and served on various divisions of the Pennsylvania Lines west of Pittsburg, in that capacity, until 1901.

I was transferred to the General Manager's office on special work, principally connected with transportation matters, as General Investigator.

Afterwards I resigned from the Pennsylvania service to accept the position of Assistant Manager of erection of the American Bridge Company, a subsidiary of the United States Steel Corporation. I was on the Pittsburg district where I had charge of the erection of steel bridges and buildings in Ohio, Indiana, West Virginia and several other states and a portion of Canada.

I resigned from that position to accept the position of engineer of maintenance of way of the Baltimore and Ohio and the Baltimore & Ohio Southwestern system.

After about a year in that position I was promoted to be assistant to the General Manager, where my duties were principally connected with the reorganization of the accounting and reports in the Mechanical Department.

After about a year in that position I was promoted to be Assistant General Superintendent of Transportation in charge of local and through freight service.

I left the Baltimore & Ohio to accept a position as Assistant to the Chairman of the—I have forgotten now whether of the Board or the Executive Committee of the Rock Island Company, which at that time controlled the Chicago Rock Island & Pacific, the Frisco,

3989 the C. & E. I., and the E. & T. H. railway systems.

On taking that position I was assigned as Chairman of two committees, first on disbursement accounting and, second, on revenue accounting. The duties of those two committees were to reorganize the accounting and reporting structures of the four companies, to

secure uniformity so that a comparison of results could be more accurately obtained.

After Mr. Loree left the service of the Rock Island as its Chairman, I entered the service of the Missouri Pacific Railway System, and have been with it since then in my present capacity.

During the time I was connected with the Baltimore & Ohio Railroad I was selected by the President as Chairman of a committee on accounting, for the purpose of attempting to improve on the system of revenue accounting at that time in use.

The Baltimore & Ohio at that time was controlled by the Pennsylvania Lines, and Pennsylvania officials were in charge of the property; but instead of installing the system of accounting which was in use on the Pennsylvania Lines at that time, and which they considered obsolete, and entirely unsatisfactory for the purposes of the operating officials in studying results of operation and securing more accurate operation and more economical operation, they decided to endeavor to devise an improved system. That was worked
3990 out after examining into the systems in use on various railroads, and was installed on the Baltimore & Ohio System.

Shortly after Mr. Cassatt, then President of the Pennsylvania Railroad appointed a committee consisting of representatives from the allied lines of the Pennsylvania, the Pennsylvania Railroad, the Pennsylvania Lines west of Pittsburg, the Baltimore & Ohio, the Chesapeake & Ohio, and the Norfolk & Western, to take up the question of working out a better system of disbursement accounting, which should be uniform on all of those lines.

I was a member of that committee as one of the representatives of the Baltimore & Ohio System; and after considerable investigation the Pennsylvania Lines through this committee, adopted practically the system that had been adopted by the Baltimore & Ohio.

Later, when I entered the service of the Rock Island Company one of my duties was to install a revised system of disbursement accounting; and practically the same system as that adopted by the Pennsylvania Line was installed on the Rock Island, being modified slightly because of the difference in the organization of the two companies.

After entering the service of the Missouri Pacific System the difficulties in regard to the system of disbursement accounting in use, brought about a request for me to assist in the installing of a system of disbursement accounting on those lines.

3991 And practically the same system was installed there.

Later the Interstate Commerce Commission took up the question of revising their system of disbursement accounts, because they had been found to be out of date, and after considerable study of the question, in which the Commission, principally through Professor Adams, consulted very freely with various railroad organizations among others the American Railway Association Committee on Statistical Inquiry, of which I was a member for a number of years, they adopted their present system of disbursement accounting, which is, except in minor particulars, the system which was installed origi-

nally on the Baltimore & Ohio Railway by the committee of which I was Chairman.

Q. Can you state what changes were made in the system of accounting, under the method adopted by the Baltimore & Ohio Committee, and particularly with reference to that branch of accounting which related to the disbursement of operating expenses?

A. The changes were such as to produce an entirely different distribution of the charges; and the principal object of the new system of accounting was to avoid the placing of two items of expense in one account, which two items were brought about by two entirely different characters of operation; and which, consequently, could not be measured with any reasonable degree of accuracy by a com-
3992 mon unit.

The old systems of accounting in a general way were apparently based on the idea of attempting to get at the cost of a particular class of service. As, for example, the cost of passenger service, or the cost of a class of freight service. But for operating purposes this was entirely unnecessary, and defeated the purposes for which operating statistics are needed, namely, analysis of the operations, with a view to determining where the operations are abnormal, and with a view of promptly correcting the operations so as to secure economy operations.

Q. The question has arisen in this case, Mr. Byars, as to the qualifications of various officials for the purpose of determining operating expenses and determining which expense should be divided between branches or classes of operation: some testimony has been given that accounting officials were better qualified to judge of the proper distribution of that kind of expense—say expense of maintenance of way and structures, or equipment, than the operating officials. I wish you would state in your own way what your views are on the subject as to the relative opportunities and ability of the two classes of officials—that is, the operating officials and the accounting officials, to determine the relative expense or the distribution of expense of the two branches of service?

A. My opinion is that, other things being equal, the experience of the operating officials is of a character which makes it much
3993 better for them not only to design such systems of accounting but to interpret the results that are obtained.

There has been a very great change in the line of thought in railway service in regard to that particular thing in recent years, and to my mind it has been caused very largely by the growth of the systems themselves.

In former days of railroading the systems were comparatively small and it was possible for the operating officials to get over the property so frequently and to be so intimately in touch with the details of operation that they did not feel the need, especially, of operating statistics to aid them in securing economical results. But with the growth of railway systems, that condition has changed and today the systems are so large that it is necessary to have something to direct their attention to operations which seem abnormal, and where their immediate personal attention is probably most needed.

In other words, having very much more extended duties, it is necessary to devise means for economizing their time in the performance of those duties.

I think, perhaps, I can illustrate what I have in mind by a resort to historical circumstances that are probably very well known to nearly everyone. In ancient times the Battle of Ivry was one of the celebrated battles, and King Henry of Navarre was personally in charge of one of the armies engaged in that battle. According to accounts he not only was personally in charge but he actually
3994 personaly led the attack that was made by his army on the enemy. That illustrates the old style of railroading, where the units were so small that the man in charge could be actually in charge of practically all operations, and be immediately on the ground to see them performed.

On the other hand, a few years ago there was the Battle of Mukden and Marshal Oyama at that time had nearly half a million men on the battle field that extended over several hundred miles. The accounts of that battle seem to indicate that he was probably forty miles away from it. He did not in any way attempt to lead the charges of the various portions of his army but he was informed by means of telegraph or telephone service of the progress of affairs from time to time, and directed them through that knowledge. If he had attempted to lead any one army he would not have known what was going on elsewhere and probably would have been defeated. That illustrates the method of operation of the large railroad systems today. It is necessary to use statistics to secure economical operation and the operating officials of today have been gradually trained to the use of such statistics. They have the great advantage of those not familiar with operations, that they have a better knowledge of what the figures actually mean.

Q. Mr. Byars, where does the primary information that is the basis of those figures or compilations that are prepared by the accounting officers come from?

3995 A. The primary figures must of necessity be furnished by the operating employes. The compilation of those figures is from one point of view a matter of no importance. That is, they can be compiled by the accounting employes or by the operating employes, or they can even be compiled, as has been done for a number of years, by the New York Central Lines, by an electrical machine which was designed for the purpose.

The main feature of importance is as to where they can be compiled in order to place the information most quickly in the hands of the operating officials for their use in securing economy of operation.

The actual interpretation of those results can only be satisfactorily made by persons who have gained a knowledge of what the figures really mean. It may be that the accounting officers have gained that knowledge through their study of operations, or it may be that the operating officers are the ones who use the figures. But in individual cases, in order to interpret the figures successfully, it is

necessary to have knowledge of operation, and, consequently, of what the figures signify.

For example, if I received a statement of sales of various kinds of cloth, some of them silk, others cotton, and that statement showed the price at which those kinds of cloth were sold, I would have very little idea from looking at those figures whether they were correct or not, because I do not know the values of those different kinds of cloth. If those figures, however, were submitted to a merchant who was entirely familiar with the value of fabrics of that character, and if in those figures there was an error whereby one of the fabrics was shown at two or three times the cost it ought to have sold for, the probability is that he would at once notice it, whereas one who was not familiar with the meaning of the figures would have passed the error by without detection.

3996

Q. The primary information, then, that is, the information as to the practical operation, is collected by the operating officials and goes from them to the accounting department: is that correct?

A. The primary information is collected by the operating employes and in some cases it is transmitted to the accounting department for compilation, and in other cases it is transmitted to the operating department for compilation; and in still other cases it is compiled partly by the operating department and finally is completed by the accounting department.

The New York Central System, several years ago, when I investigated it, used to send this primary information very largely to the accounting department, where it was compiled by the use of electrical machines of the same type that were then used in the compilation of census information.

On the Pennsylvania Lines west of Pittsburg, at the time I was connected with them, the information in regard to the operations was largely compiled by the operating officers. Some of it was compiled by the accounting officers.

3997

On the line with which I am connected today—

Q. You mean the Missouri Pacific?

A. Yes, sir, the Missouri Pacific System. The compilation of maintenance of way operations, for example, is made almost entirely by the operating officials, and the interpretation of those figures is also made by the operating officials.

The method of compilation and system of figures was designed entirely by the operating officials.

Q. You are directly connected with, I believe, and have charge of maintenance of way department of the Iron Mountain and Missouri Pacific System?

A. Yes, sir.

Q. The defendants in this case have presented a method of division of expenses of operation between state and interstate business, by dividing expenses between passenger and freight service on a basis assumed by them; and then they undertake to make a division of expense of operation between each of those branches. For instance, on freight the expense of conducting freight traffic seems to have been ascertained by them by dividing into certain groups,

beginning with maintenance of way and structures, and dividing that between two classes of trains that operate on the road, through trains and local trains. After having ascertained the expense of each class of train then they proceed in the manner adopted
3998 by them to divide that between state and interstate traffic respectively carried on those two classes of trains.

Now, in their scheme they divide the expense of maintenance of way and structures on the basis of expense of car mileage and engine mileage, allowing two and one-half times as much, I believe, for engines as they do for cars. In arriving at the number of engine and car miles they have added 50% of the engine miles to local trains for station switching.

As I said a moment ago, each engine mile is equivalent to 2½ car miles.

That is the system of division introduced in this case by the State.

Do you think that is a proper method of separating and dividing the expense of operation of maintenance of way and structures as between the varous branches of the service, including local and through trains and through and local traffic carried on those through trains, for the purpose of ultimately dividing those expenses between state and interstate business?

A. It seems to me that method of division could be accurate only by accident. It does not take into consideration, that is, the method of division between local and through trains does not take into consideration a number of the factors which affect the cost of
3999 operation of those two classes of service. And further, it fails to consider that there is at least 75% of the maintenance of way and structure expense that does not vary with the changes in the amount or character of traffic at all. Of the remaining 25% of maintenance of way and structure expense there is a very large proportion that while it varies more or less with changes in the amount and character of the traffic, yet these expenses are not necessarily incurred at the time the traffic is handled, but it may be incurred a great many years after that, so long after as to apparently destroy the value of the data obtained in the method proposed.

For example, the renewal of steel rail is brought about by the wear and tear of passing trains. That steel rail stays in the track five, ten, fifteen, twenty, or thirty years before it is renewed, and the expense incident to the wear and tear on that rail today may not be actually incurred by the railroad company until a great many years afterwards, when the rail is actually renewed.

A separation between local and through trains of maintenance of way and structures expenses on a car mile basis does not take into consideration the variations in the size of the locomotive. It does not take into consideration the variations in the amount of the lading in the car. Consequently, it would be possible to take a given condition of service, where a certain per cent of car mileage and
4000 engine mileage went to local service and a certain per cent to through service and by changing the character of one of the services in items which the formula was in no wise influenced by,

the actual expense incurred by that class of service would be decreased or increased.

For instance, placing a very much heavier locomotive on the through freight service would not in any way change the per cent of car mileage as figured out by this proposed formula; and yet it would change the amount of expense for maintenance of way and structures which would be brought about by this through service, and would change the proportion of the total expense of maintenance of way and structures which would properly be apportioned between the through and local service, as the result; yet, the formula would not bring about any such change.

Q. Would differences in the loading of cars and in the speed of the train have any influence in the distribution of this character of expense, as between local and through trains?

A. It would have an influence in the 25% approximately of expense which varies to a certain extent with the amount and character of the traffic. But it seems to me it is necessary to keep particularly in mind the fact that by far the greater proportion of the expense for maintenance of way and structures is not affected by these variations, and the small proportion that is affected is much of it affected in such a remote way that it would be much more accurate to con-
4001 sider the maintenance of way and structures expense in the same way as the general expenses are considered and distributed.

For instance, one of the items of expense for maintenance of way and structures is the repair of fences. There is no relation between fence repairs and the amount of traffic handled or the character of the traffic. It has nothing to do with this traffic and that expense, as well as other items, which must total at least 75% of the total. The expenditures are brought about by the necessity for correcting the destruction by the elements, of the property, and they are necessary and the expense must be incurred, simply for the purpose of maintaining the property in condition to be ready to handle the traffic, even were there no traffic handled over the property.

The remaining 25% due to its character and due to the relatively small per cent of it, it seems to me should be handled in the same way—that is the entire distribution of maintenance of way and structure expense, to state and interstate, should be handled the same way as general expenses, rather than through a system of complicated formulas which cannot possibly be accurate in themselves, and which apparently introduce an unnecessary amount of complication in the obtaining of the desired data.

Q. Mr. Byers, if lighter engines are used in one or other of the branches of service, say in the hauling of local trains, what effect would that have upon the state's method of dividing the expense of maintenance of way as between local and through trains?

4002 It would bring about error in the figures obtained, because in certain portions of the maintenance of way and structure expense the weight of the engine has an appreciable effect on modifying the total amount of expense. If one class of service were equipped with heavy engines and the other class with light engines,

there would be a change in the relative expense brought about by the two classes of service, that would not be reflected in the distribution as carried out by the formulas proposed.

Q. What is the practice on the Iron Mountain road as to the character and weight of engines, say in the two branches of freight service, local and through, or are you prepared to state that?

A. I can state that only in a general way, because that is a branch of the service which is not connected in any way with my present duties, and it would be only by very casual observation.

The ordinary practice of railroads, however, is to use their lighter engines on the local freight service, and the heavier engines on the through freight service, where the mileage obtained by the engine is usually greater, and where the trains are usually much heavier.

Q. There is a reason for that, isn't there, in the fact that you wish to use the engines up to their capacity or potentiality and that heavier loads and longer trains would necessitate the use of
4003 heavier engines on through trains?

A. It is usually considered economical to use the engines in that way and for that reason among others.

Q. This basis of division of car mileage also disregards the loading of the two classes of trains. The evidence in this case shows that the cars on the through trains carry heavier loads than in the local trains: what effect would that have upon the state's method of dividing on a car mileage basis in the two branches of service?

A. The wear and tear produced in the items under Maintenance of Way and Structures that is brought about by the traffic is of course a matter of gross traffic rather than net traffic. In other words, it is a matter of the total weight on the rails rather than the amount of freight which happens to be in the car, disregarding the weight of the car. And if there is a difference in the amount of freight which is to be put into the car, of course, the total amount of weight of the car is changed and it will apparently make some difference in the division of the expense. But it seems to me it should always be borne in mind in connection with the maintenance of way expenses there is a very small proportion of that expense which varies in any way whatever with the amount or character of the traffic.

Q. That is the principal objection to it, you think, that it is a character of expense which is not incident to operation, but it grows out of other causes, and therefore, it cannot be properly divided
4004 on the assumption adopted by the state in this case?

A. That is the primary objection so far as the greater portion of the expense is concerned. And, so far as the smaller portion of the expense is concerned the incurring of the expense by the railroad is so long deferred in the very great proportion of it as to make such figures almost entirely meaningless.

Q. Does not the inequality in the loading of the cars, that is to say, if one car is loaded heavily, say forty tons, and another car has light loading, say five tons, result in a large proportion of what you call dead weight in the lighter loaded car?

A. Yes, sir.

Q. What effect would that condition have upon the fairness of

dividing the expense of operating these two classes of trains as between the contents or the traffic carried in them? You take two cars now, one heavily loaded and one lightly loaded: you say there is a larger proportion of dead weight in the lightly loaded cars: now if you are going to divide the expense of operating those cars by the contents, would that properly be held to be considered?

A. In regard to that portion of the maintenance of way and structure expense which is affected by the traffic, the fact that a certain portion of the freight carried is accompanied by a greater amount per ton of dead weight than another proportion, would cer-
4005 tainly very much interfere with the accuracy of the formula proposed, because the wear and tear is produced partly by the amount of weight which the track has to carry and the formula does not establish any relation between this amount of weight and the amount of the revenue tonnage.

Q. Assume a through train carries state and interstate cars, that one class of those cars is more heavily loaded as a rule than the other class: now, I understand from the views you have just expressed that it would not be fair in your judgment to divide the expense of operating that train as between the two classes of freight carried on it, state and interstate, on an equal basis—that is to say, dividing it by the number of tons carried on the train, without discriminating as between the tonnage of the lighter loaded and the more heavily loaded cars?

A. I do not think it would be fair.

Q. And the same would be true of the loads on the local trains, wouldn't it?

A. The same condition exactly would apply on the local as on the through trains, under those circumstances.

The damage to the track would be brought about by the weight on the track, and if it was not considered in the formula, and the formula considered only a portion of the weight on the track, the formula would evidently be in error except under exceptional conditions when it happened to produce correct results.

4006 Q. You are speaking now of the distribution as between the trains.

A. Yes, sir.

Q. Mr. Byars, your statements have been made with reference to the freight branch of the service up to this time. The state attempts also to divide the expense of maintenance of way and structures in passenger service between the different branches of the car mileage basis: what do you think about that method of division?

A. I think there is about 75% of the maintenance of way and structures expense that are not affected by the car mileage, to start with; and, consequently, a division on a car mileage basis would seem illogical.

Q. Do the views you have expressed heretofore as to the freight service apply equally to the passenger?

A. On that basis, yes, sir.

Q. Is there anything further you wish to say in regard to passenger service?

A. No, sir, I think not.

4007 Cross-examination of Mr. M. L. Byers.

By Judge HILL:

Q. Mr. Byers, in the question Mr. Moore put to you as to the division of expense made by the State Accountants he has referred to both a division between state and interstate and between local and through trains: I want to call your attention to the fact that in the division of expenses between local and through trains, where the car mile is used as the unit, there is no division between state and interstate, using the car mile as a unit; the division between state and interstate is not made in any way upon the car mile. But it is made in the way explained in those exhibits and the only use of the car mile, so far as maintenance of way is concerned, is the division between local and through trains. I want to state those facts to you in order to see if you so understood it in giving the answers you did to Mr. Moore.

A. That was my understanding.

Q. Your answers seemed to indicate that was your understanding, although the question seemed to be calling for your opinion as to using the car mile as the basis of division between state and interstate—although there is no such use of the car mile in mak-

4008 ing such division.

A. I so understood it.

Q. You have studied the exhibits in this case?

A. Not all of them.

Q. The general principles you have studied and are familiar with?

A. Yes, sir, so far as maintenance of way and structures is concerned.

Q. I understood you to say that the constant expenses for maintenance of way, by which I assume you mean those due to weather and natural decay, and things of that kind, is about 75%?

A. I should say it was at least 75%.

Q. Which is usually estimated higher than that, isn't it, Mr. Byers?

A. I cannot say as to that. It would vary with the conditions. I should say it was at least 75%.

Q. Mr. Parker, who has had considerable experience as an engineer of maintenance of way and is now engineer for the Texas Railroad Commission, estimated it as high as 90%: would you consider that out of the way at all?

A. It might be as high as 90% in some cases.

Q. I am speaking of the general rule and I do not want any exceptional cases.

A. I think that is rather high, as a general rule. I purposely put my figures at what I thought was a conservative figure.

4009 Q. You put it at at least 75%?

A. Yes, sir..

Q. Then I would infer from what you say of that and what you say about Mr. Parker's estimate, it would be a varied quantity, somewhere between 75 and 90 per cent.

A. I should judge that would be a fair way to express it.

Q. As I understand it, your chief objection to using the car mile for dividing maintenance of way expenses between local and through trains, is that this constant factor is there, and that the car mile would not represent that factor: is that correct?

A. That is one objection but not necessarily the chief objection.

Q. Would not that objection be present in any method of dividing expenses?

A. I cannot answer that. I cannot keep in mind all possible methods for dividing such expenses.

Q. By "methods" I mean approved methods that are used as factors for dividing expenses in railroad accounting, the subject which we are discussing here?

A. I do not know.

Q. I believe you stated in your testimony that these expenses should be divided as the general expenses are divided?

A. I think the character of the expense is similar to that
4010 of the general expense and whatever method is proper and fair for the division of general expenses would be proper and fair for the division of that expense as a result?

Q. What would you say of the train mile basis for the division of general expenses between freight and passenger traffic? Would that be a fair method?

A. It has been so long since I have had anything to do with expenses other than maintenance of way and structures that I do not consider myself at the present time as being qualified to pass upon it.

Q. Mr. Byers, you stated in your testimony that it should be so divided as general expenses are divided, and you are familiar with the expense of maintenance of way, if you can find a unit for it it seems to me you would be competent to state what unit would be a fair one?

A. For what?

Q. For dividing expenses between local and through trains for maintenance of way expenses.

A. I presumed there would be found a fair basis and a proper basis for the division of the general expenses of different classes of service, and I have studied this question of the division of maintenance of way expenses far enough to make up my mind that it is practically on the same basis as general expenses; and on that assumption it did not seem to me to be necessary to go further. I am not at the present time qualified to pass upon the division of general
expenses, but whatever is fair for that would seem to me to be
4011 fair as to the division of the greater portion of maintenance of way expense, if not all of it.

Q. I will state for your information if you do not already know it, that the railroads in this case in dividing expense of maintenance of way between freight and passenger traffic have divided it upon the train mile basis, which is shown in Statement 5 of Exhibit 3 of the St. Louis Iron Mountain & Southern Railway Company exhibit in this case.

I will ask you if it is not a fact that all of the reasons which you gave in your testimony yesterday against the car mile division of

1705

expense between local and through trains would be equally applicable to the train mile division of maintenance of way expense between freight and passenger?

A. I think not.

Q. It would not be?

A. I think the train mile as a general condition in making a division between freight and passenger of the maintenance of way expense is somewhat less in error than the use of the car mile statistics would be for the same purpose.

Q. Let us take up those reasons: the first you gave as I recall it, against the use of the car mile between local and through, was the fact that at least 75% of the expense was constant and that would not measure it: is not that same objection true as to the train mile?

A. There is at least 75% of course that are constant and that would be present whether you divided by the train mile or by the car mile.

4012 Q. Either factor would be equally objectionable for that reason, would it not?

A. There are so many factors that enter in to that question that I hardly feel qualified to say that the two factors are exactly the same in all particulars as producing error.

Q. The objection you raise to the car mile, however, upon this ground is true of the train mile, on the ground on which the railroads use it, is it not?

A. The objection to using any unit of actual operation which does not consider all features of the problem would apply, I should think.

Q. Does the train mile consider all the features of the problem any more than the car mile does, in regard to this constant expense I am talking of?

A. I cannot say whether it considers all features as well or not.

Q. The next objection, as I understand, that you make to the car mile division is this: you say "of the remaining 25% of maintenance of way and structures expense there is a very large proportion which while it varies more or less with changes in the amount and character of the traffic, yet these expenses are not necessarily incurred at the time that the traffic is handled but it may be incurred a great many years after that, so many years after as to apparently destroy the value of the data obtained in the method proposed."

4013 Would not that objection be equally true to using the train mile as a basis for dividing expense of traffic?

A. I cannot say whether that would be equally true or not.

Q. It would be true ?

A. There would be that objection to the use of the train mile as a means of division of maintenance of way expense between freight and passenger.

Q. You mean by that, the replacement of rails and ties and things of that kind. That is what you are referring to, isn't it?

A. I mean the division of the cost of replacement.

Q. That is what I mean. Cost of replacement.

A. As one of the items the cost of which is incurred long before.

Q. Mr. Byers, if you take the statistics of a road for any given

period, say six months, and attempt to divide the expense of operation between any classes of traffic, this objection which you make would be applicable to any basis of division, would it not?

A. To which objection do you refer?

Q. This objection we were last discussing, that the expense of renewal would be incurred long after the actual use which caused the expense?

A. I cannot say it would be true of any basis.

Q. "By any basis" of course I mean any basis in use in
4014 railroad accounting for the division of expenses between any classes of traffic?

A. That question is almost too general to be answered without the possibility of not knowing some of the bases that are used.

Q. What bases are used in railroad accounting for the division of expenses: what are the factors in common use?

A. For what purpose?

Q. I am asking generally, now.

A. We use different bases for different purposes. Now I am familiar more or less, with the bases that are used for the purpose of studying the cost of operation with a view of securing more accurate operation. I am not familiar with the bases used for the purpose of distributing, as you are endeavoring to do, between one class of service and another.

Q. With what bases are you familiar?

A. The ton mile basis is used for certain purposes for applying to certain figures. The train mile basis is used and in some cases the tonnage is used. In other cases the number of passengers handled, the passenger mileage. And in other cases an adjusted tonnage figure is used.

Q. What do you mean by "an adjusted tonnage" figure?

A. Adjusted for the resistance of the car, for example. But while those figures are used and give fairly useful results in the study of the economy of railroad operation, it does not necessarily
4015 follow that it can be used in determining how much expense is produced by one class of service and how much can be produced by another class of service.

Q. But if you use any basis to divide expenses that were paid out during a given period, that basis, no matter what it was, would be open to this objection you make here, would it not?

A. Any basis I know of would be open to that objection.

Q. Is it not a fact that in economical railroad management estimates are made of these maintenance of way expenses in advance, and that they can be intelligently forecasted and kept practically uniform one year with another and one period with another?

A. Estimates of expense?

Q. Estimates of expense of maintenance of way?

A. The estimates of expense of maintenance of way are made and sometimes they are actually followed and at other times they are not followed at all closely because the conditions have changed.

Q. You are speaking of estimates for work, but I am speaking of estimated charge to operation for maintenance of way.

A. That is what I am speaking of, estimated charge to maintenance of way and not new work. That varies from time to time.

Q. Does it vary materially on account of the volume of traffic?

4016 A. I do not think it does directly on account of the volume of traffic.

Q. That is not really a factor in determining the amount of expense incurred for maintenance of way, is it?

A. Not directly and yet, indirectly, it has very frequently very considerable to do with it. The volume of traffic of course effects the net earnings of the railroad and the net earnings of the railroad determine very considerably what is possible for the railroad, the same as for an individual, to expend.

Q. That would be largely a question of improvement, would it not?

A. I should not say so. It applies to improvement as well as operation, but it applies to operation.

Q. That is the financial side of the problem more than the operating side, is it not?

A. The financial side of the problem is somewhat connected with the operating side of the problem with a railroad as with an individual.

Q. More or less?

A. More or less.

Q. That would not affect, however, a division of past expenses?

A. No, sir, not at all. The future earnings would not affect the division of present expenses.

Q. If you were given a problem that for a certain period

4017 the expense for maintenance of way was so much, you would find a basis of division between the different classes of traffic?

A. Which would be fair?

Q. Yes, which would be fair. That is the problem we have here. I ask you if the objections you have urged against the car mile division, based upon the objection that the replacement would take place at some later period, would not be applicable to any division of those expenses?

A. I do not say whether it would be applicable to any division or not, but it would be applicable to any division I know of. But it would be applicable to one division probably on a different basis than would apply to another division. In other words, there is a relative amount of error. Some divisions might be more in error than others.

Q. There would not be any question of being more error in one division than the other on account of this reason you are suggesting, namely, that the replacement takes place years afterwards?

A. I think not.

Q. I can readily see where there would be a question of how great is the error on other propositions, but I cannot see how it would be on that proposition. You agree to that, do you not?

A. That would seem to be correct.

Q. You state here "The separation between local and
4018 through trains on the Missouri Pacific on a car mile basis, does not take into consideration the variation in the size of the locomotives. It does not take into consideration the variation in the amount of the lading of the car."

That would be equally applicable to a train mile division of those expenses, would it not, between any classes of traffic?

A. Between local and through trains?

Q. No, I say between any classes of traffic, say freight and passenger.

A. I cannot say whether it would be equally applicable or not, but there would be that objection to a greater or less extent with any other basis I know of.

Q. The train mile would be open to this objection, whether open to the same degree or not would depend upon the conditions on the road, I presume.

A. It would depend upon the conditions of the particular property.

Q. Of the particular road and the condition of traffic on that particular road: that is what I mean.

A. Yes, sir.

Q. Do you consider the variation in the lading of the car a matter of any moment in the division of maintenance of way expenses between each class of traffic?

A. It has some effect but just how much I think it would be im-
possible to determine. It does not affect the 75% or there-
4019 abouts that is not affected by the traffic. But it does have some effect on the 25%. But just what effect it is very difficult or impossible to exactly determine.

Q. The reason for that, I presume, would be the greater weight of load would cause more wear on the rails and ties and roadbed, etc.

A. The greater weight would not only cause more wear and tear but disturbs the relations of the different portions of the track structure to each other to a greater extent.

Q. There would have to be a material difference in the weight, however, would it not?

A. Well, the greater the difference in the weight the greater the difference in the result would be. The difference, however, which actually exists on a railroad is sufficient to make a very considerable difference in those elements of cost that vary with the traffic.

Q. Take two cars where there is a difference of say five or six tons in the loading of those two cars, would that have any appreciable difference on account of the five or six tons difference in the loading, in this maintenance of way expense?

A. Under some conditions it would but under other conditions it would not, depending upon the stability of the track very largely. For instance, on a bridge, that would have practically no difference. On a track which was less stable than a bridge it might cause an appreciable difference in some cases.

4020 Q. On the good tracks that the Iron Mountain Railroad Company maintain in Arkansas—and I believe you maintain good tracks down there, don't you?

A. We try to, so far as the "powers that be" will let us get money enough to do it with.

Q. You have pretty good track down there, haven't you?

A. Here and there.

Q. On such tracks as you maintain in Arkansas, Mr. Byers, would a difference of four or five tons in the loading of two cars—taking two as an illustration—make any appreciable difference in the maintenance of way expense?

A. There would be a difference, but how much it would be I would be entirely unable to tell you.

Q. Wouldn't that be very well defined by a word which has been much used in this case, as one of the "negligible" quantities?

A. It might or it might not.

Q. What do you think about it? Might it or might it not?

A. For the two cars?

Q. Yes, taking those two cars. I am taking those two cars simply as an illustration.

A. I think the effect of two cars would be negligible. But if there was that difference between all of the cars in all classes of service, and you are endeavoring to obtain the amount which should be charged to the two classes of service on account
4021 of expenditures produced by wear and tear, I am not sure that it would be negligible.

Q. The next point I wish to take up here is, using heavier locomotives on through freight service than they usually operate on local service, you think that would make a difference, do you?

A. The application of a heavy locomotive instead of a light locomotive would in some cases make a material difference in the cost of maintenance on those items which are affected by the traffic.

Q. I understand that. You are confining these objections, as I understood you, to what you assume to be twenty five per cent.

A. Yes, sir, twenty five per cent approximately.

Q. I believe you made the very general answer that you did not know whether it was a fact that they were using lighter engines on the local trains in Arkansas, than on the through trains; but you assume that from your general knowledge of railroading; isn't that a fact?

A. Yes, sir, and from my general knowledge of the Iron Mountain.

Q. Assuming that would be true, that would place a somewhat greater burden on the local train than should be placed upon it—that is, the engine mile basis of division would place a somewhat heavier burden on the local train than it was entitled to.

4022 A. If the local train had a smaller locomotive than the through train, and you are dividing that cost on an engine mile basis, it would then be unfair to the local train, on account of throwing too much expense on the local train, so far as the damage produced by the locomotive is concerned.

Q. I understand. Would that be an appreciable quantity or does that belong to one of those negligible matters?

A. In some cases it would be a very serious matter, and in other cases it would be negligible. It would depend upon the extent of variation in the size of the locomotive and again on the condition of the road-bed. Again, to illustrate, the effect on a bridge would be comparatively small, because it would be confined principally to wear and tear on the rail. It would be very difficult to figure that for one locomotive. Whereas on the road-bed, such as we have in considerable portions of Arkansas, it would be quite a serious matter—that is, the use of a heavier engine as against the use of a lighter engine.

Q. Would that be as appreciable an element as the one we have just been referring to, the difference of four or five tons in the loading of the cars?

A. I think the effect of the application of the heavier locomotive would probably be more damaging to the track than the difference in the loading.

Q. I am speaking of conditions in Arkansas as you understand them and not a general condition; the character of the loco-
4023 motive used on the local and through trains in Arkansas, and the character of the track in Arkansas.

A. I think the effect of the use of a heavy locomotive on our tracks in Arkansas would be more seriously felt as compared with the effect of a light locomotive, than the effect of a lightly loaded car as compared with the heavily loaded car, as I understand the conditions to be in Arkansas.

Q. Then you are speaking in the foregoing answer, when you refer to light locomotives, of such as are used on the local trains in Arkansas as compared with the heavy locomotives used on the through trains in Arkansas, are you?

A. I am considering the light locomotives we have on the Iron Mountain System as compared with the heavy locomotives, which I know are in use there, without attempting to say that one or the other is used entirely in one or the other of the two classes of service.

Q. But you are using your judgment based on what you know of the locomotives that are used in the two classes of service, are you?

A. I do not think my statement requires any judgment to be used in that direction. I am simply stating that the heavy locomotives would produce per locomotive mile a much greater amount of disturbance and expense as compared with the light locomotive, than would be produced by the heavily loaded cars as compared with the lightly loaded cars, as I understand the difference
4024 between a heavy locomotive and a light locomotive, or a heavily loaded car and a lightly loaded car, to be in Arkansas on our lines.

Q. As between through and local trains you are referring to?

A. No, sir, I am not referring to them as between through and local trains, because I do not know accurately what the conditions

are as to specific differences in the use of light and heavy locomotives in Arkansas.

Q. You stated "The ordinary practice of railroads, however, is to use their lighter engines on the local freight service, and the heavier engines on the through freight service, where the mileage obtained by the engine is usually greater, and where the trains are usually much heavier."

A. Yes, sir, and I am assuming that is being used on our line in Arkansas, but I do not know it.

Q. In answering the preceding questions on that subject you have been bearing in mind, or rather, the application has been to this condition of affairs as stated in your testimony on Saturday, hasn't it?

A. I understand your questions have been with reference to the effect of lightly loaded cars as compared with heavily loaded cars; and the effect of a light engine as compared with a heavy engine.

Q. Let me interrupt you there just a moment, please. The
4025 only point of difference between us is that you are using the terms lightly loaded car and heavily loaded car, and light engine and heavy engine, in a general sense, and I am trying to find out from you in a concrete sense, taking the cars used on the local train- and the cars used on the through trains, with a difference of four or five tons in loading between the through freight trains and the local freight trains.

A. I think the point of difference as I understand it is that not being entirely familiar with the local as compared with the through service, I am confining my remarks to the difference between the cars regardless of the service, and to the engines regardless of the service, whereas you are asking me to state them with reference to the service.

Q. That is what we are trying to do, to find out something about the service in this case; and I am trying to test your knowledge of it as developed in your testimony on Saturday, to find out just how to compare them.

To bring it down to a concrete case, take such engines as are usually used on the local trains, and such engines as are usually used on the through trains, and assuming the variation in loading between the local and through trains of say four to five tons, which would be the more appreciable element of expense for maintenance of way *than* heavier locomotive on the through train or the heavier loading on the through train?

A. As between the two I do not know. The difficulties in
4026 ascertaining effects of the character are so great that while it is possible to say that differences in the effect exist, and that in some cases they are great and in some cases they are small, yet when you attempt to make a comparison of that sort it seems to me impossible to make it accurately, or even reasonably accurately.

Q. But your general impression is that the heavy locomotive would cause more damage than the heavier loaded car?

A. For one locomotive, or one car?

Q. Yes.

A. Of course, we have fewer locomotives than cars—or, rather, whether the greater number of cars will over-balance the effect of each car or not I cannot say.

Q. That is not my question. I am trying to get at the unit to measure by: you would say the unit of the locomotive would do more damage than the unit of the car?

A. That is not due entirely to the greater weight of the locomotive as compared to the greater weight of the car. It is due to the fact that the locomotive has reciprocating parts which the car does not have, and these reciprocating parts do very much more injury for the same weight than the car. They act very much as a hammer upon the rail. That is not produced to any such extent by the car.

Q. You have gotten away out of my jurisdiction. What do you mean by "reciprocating parts of the locomotive?"

A. The parts that go backward and forward, instead of
4027 round and round.

Q. Mr. Byers we have been using one car and one locomotive as an example; suppose the heavier loaded car were pulled by the heavier locomotive, and the lighter loaded car were pulled by the lighter locomotive, what would be the difference in the wear and tear on the track?

A. That would depend again on the speed at which they are pulled, as another factor.

Q. There would be no other difference between those than the question of speed?

A. I am not so sure of that.

Q. There would be no other appreciable difference would there?

A. As you state the problem, that is the thing that immediately occurs to me, that speed would be the material factor.

Q. You regard speed as a material factor in the wear and tear on tracks, do you?

A. If you include the labor of keeping the parts in their relative position to each other, yes.

Q. You mean the parts of the track?

A. Doing the surfacing, that is an appreciable expense which varies to a certain extent with the amount of traffic.

Q. The train which makes the faster speed on the track entails the heaviest expense on the track, does it?

A. Yes, sir, other things being equal. If the trains had
4028 had the same size of locomotive and the same number of cars—in other words, all other things being equal.

Q. I believe it is agreed between all the witnesses in this case that the local trains run faster between stations: is that your observation?

A. It seems to me at certain points the local may run faster than the through train, but the average speed of the local while actually running is not necessarily greater than the speed of the through train while actually running.

Q. I believe that most of the witnesses agreed it is.

A. My judgment is that the witnesses referred to maximum speed rather than average speed.

Q. No they referred to ordinary practice. It takes more time to make its run, but the actual running time from start to finish I believe they have all agreed is faster on the local than on the through.

A. I do not know whether that is true or not. It seems to me you have got to consider that the local train stops at practically every station and it gets a very long distance from that station before it acquires its maximum speed; whereas the through train goes through that station at pretty nearly maximum speed.

Q. I would like you and Mr. McPherson to debate that question.

A. I am simply stating that I do not know which is the greater of those two factors.

4029 Q. Mr. McPherson has testified to that and most of the experts for the State have agreed with him, and I think Mr. Doddridge also stated it.

I believe these matters I have asked you about are all of the elements you have pointed out. I do not recall any others in your testimony.

A. I think so. I do not recall any others.

Q. Isn't it a fact Mr. Byers that the car mile is the common factor among railroads for dividing maintenance of way expenses?

A. For what purpose?

Q. Between railroads.

A. I should say not. I should say the mile of track is the usual basis of comparison of maintenance of way expenses between railroads.

Q. For the use of joint track?

A. When I am studying, for example, the economy of maintenance of our lines as compared with some other railroad I take their expense——

Q. That is not what my question aimed to get at: what I mean is this: among railroads themselves when they come to use each other's track and make a joint use of track, in which the ownership may be joint, the question of division of maintenance expense between themselves is the point to which I am aiming to direct your attention.

4030 A. I do not know whether that is the general practice or not. That division of expense, so far as track is concerned, is a matter with which I do not come very much in contact and am really not prepared to say whether it is or is not. My work is in connection with the actual maintenance rather than with the revenue features.

Q. Mr. Byers are you acquainted with the litigation that originated here in St. Louis over the use of some tracks out about Forest Park?

A. No, sir.

Q. St. Louis, Kansas City & Colorado and the City of St. Louis and the Wabash R. R., commonly known as the Wabash track?

A. No, sir, I am not familiar with it.

Q. It is the track from Forsythe Junction at Forest Park to the Union Station in St. Louis; you are familiar with the joint use of that track and what they pay for it?

A. I am familiar with the fact that there was such litigation and that is about all I know of it.

Q. Don't you know that the car mile or wheelage basis was used for the purpose of determining what one road should pay the other?

Mr. MOORE: That is objected to as not material or applicable in this case. What is done by other people is not binding upon us.

Mr. HILL: What I am trying to establish is not a single, individual instance, but a common practice, and think a common
4031 practice in regard to this subject is clearly competent. This is a mere foundation to lead up to the question of common practice.

Mr. MOORE: He says he does not know.

Mr. HILL:

Q. You say you are not familiar with that case?

A. No, sir, I am not.

Q. I mentioned that simply to get a foundation for basing my questions and that is all.

A. I do not know about it.

Q. Do you know S. T. Emerson, a Civil Engineer of thirty six years' experience, Chief Engineer for the St. Louis, Kansas City and Colorado road?

A. No, sir.

Q. Do you know him by reputation?

A. I do not.

Q. I want to read you a question propounded to him and his answer to it and ask you your opinion from your knowledge of those matters.

Mr. MOORE: We object to the reading of the questions and the answer and the introduction of evidence in another case into this case.

Mr. HILL: This is all expert testimony and not facts.

Mr. MOORE: You cannot introduce expert evidence in this case without producing the expert here.

4032 Mr. HILL: I do not want to prove any particular fact in any other litigation or anything of that kind, but I just want to try to prove the opinion of experts along the same line as this witness and ask his opinion of those hypothetical questions.

Mr. MOORE: I do not think it is competent.

Mr. HILL:

Q. The witness was asked these questions and gave the following answers:

"Q. I want to state to you a hypothetical case; suppose that one railroad has a right under a contract to use the track of another railroad for a fair and equitable compensation, between certain points, can you tell me what would be a proper basis to arrive at such fair and equitable compensation?

A. Well, I should think it ought to be arrived at in proportion to the use.

Q. Explain to the Master how you would arrive at it.

A. On a wheelage basis.

Q. What would the wheelage basis be on?

A. On the interest of the cost of the property first, and the cost of maintenance.

Q. What do you mean by a wheelage basis?

A. I mean on the proportionate number of cars run over the road by the different railroads using it. Take the total of cars used on it and get the percentage."

(And then he takes up an example and illustrates the point with his example.)

What do you think of the use of that as a method of reaching an accurate proportion for each of the roads using it?

A. I do not think it could bring the correct results acci-
4033 dentally.

Q. You do not think it would be fair?

A. It might be, accidentally.

Q. Do you know James C. Vandyne?

A. No, sir.

Q. He is Superindendent of the Unoin Depot at St. Louis.

A. I may have met him, but I am not sufficiently well acquainted with him to remember the fact if I have.

Q. I will call your attention to this testimony he gave and ask you what you think about it:

"Q. Suppose there is a contract by which one railroad has agreed to let the cars of another pass over its tracks for a fair and equitable compensation, on what basis or how would the amount of such fair and equitable compensation be arrived at?

A. The wheelage basis is the one ordinarily selected.

Q. What do you mean by wheelage basis, how would you arrive at the amount of that basis, what would you do first?

A. I would take the cost of the road.

Q. Between the points to be used?

A. Yes, sir.

Q. What would you do next?

A. Take the maintenance of the way, the superintendence, etc.

Q. Suppose you had to arrive at the cost, what would you do next in order to arrive at the cost per annum?

A. I would keep a correct account of the number of cars and engines passing over it.

Q. Railroads usually do that?

A. Yes, sir.

4034 Q. How would you arrive at the gross amount per annum that ought to be paid?

A. Take the number of cars and engines each road would run over it, and then divide the sum of expenses and interest account by the numbers of cars and engines the roads handle, and then having a separate statement of each road we could allot each its proportion to pay."

And then he takes up the question of interest.

Is your opinion of that the same as your opinion of the testimony of Mr. Emerson?

A. I think the locomotive proportion there could be accurate only by accident, so far as maintenance of way and structures expenses are concerned.

Q. Did you ever know Mr. A. A. Talmage, General Manager for the Receivers of the Wabash and Missouri Pacific Railway?

A. No, sir.

Q. You knew him by reputation very well, didn't you?

A. I have heard of him.

Q. He was a railroad operator of great ability and distinction was he not?

A. I cannot answer as to that.

Q. I want to call your attention to this testimony given by Col. Talmage in that case:

"By the MASTER:

Q. What are the usual arrangements where one road uses a portion of a track of another, as to the basis of compensation?

4035 A. It is generally based on a rental based on valuation of the property, and for repairs of track and other necessary expenses connected with the operation, it is on the basis of wheelage which represents the percentage that the tenant line bears to the other, represents the percentage that it bears to the total number of cars passed over the line.

Q. If the renting line passed one-tenth of the number of cars that the owning line passed over the track, it would pay one-tenth of this?

A. It would generally pay one-tenth of the repairs, but the custom in regard to the fixed charges, as we term it, is one-half. Another road is allowed to use the track, a foreign road is allowed to use the track of the parent road, by paying one-half of the value of the track, the rental, the interest on one-half of the value of the property."

Now, if that question were asked you Mr. Byers, just as it was asked Col. Talmage, I will ask you what your opinion would be and I will repeat the question put by the Master there:

What are the usual arrangements where one road uses a portion of a track of another, as to the basis of compensation?

A. I would say I do not know.

Q. What would you consider to be a fair division of the maintenance of way expenses between two railroads jointly using the same track?

A. I do not believe I could give you a basis which I would consider fair, but I presume that a fair basis will be found for the distribution of general expenses and that that same basis should be applied to the division of maintenance of way expense as being fair, because the great bulk of the maintenance of way expenses are, in my opinion, of the same character as the general expenses.

4036 Q. Mr. Talmage was then asked this question:

"Q. These arrangements of which you have spoken, these cases in which one company desiring to use the tracks of another has agreed to pay one-half the interest on the valuation, and then pay the cost of maintenance according to the wheelage—those arrangements are considered fair and equitable, are they?"

to which he answered:

"Yes, sir."

You would not agree to that, would you?

A. I think that so far as maintenance is concerned, such division should produce correct results only by accident.

Q. Do you know James T. How, who was General Agent for the Receivers of the Wabash and Missouri Pacific Railways?

A. I don't think I ever met Mr. How.

Q. Did you know him by reputation?

A. No, sir.

Q. I want to call your attention to this testimony given by him:

"Q. Have you got any arrangement with the Pittsburg or Pennsylvania Company?

A. We have an arrangement with the Pennsylvania Company by which they run over our track for fifty-five miles from Kokomo Junction to Indianapolis. They pay six percent on one-half
4037 of the valuation and they pay for the maintenance in accordance with the wheelage."

Are you familiar with any such agreement the Pennsylvania Company made? I believe you testified you were in its service for a good many years.

A. I am not familiar with any such arrangement on the Pennsylvania Road, although it might or might not have existed, my work not being along such lines as would necessarily bring me in contact with such classes of information.

Q. I want to call your attention to this testimony given by Mr. James How:

"Q. All arrangements such as you have mentioned as having been made and having existed between the Wabash and its connecting lines, are they about such as are generally made between railroad companies, under such circumstances, and are they such as are considered fair and equitable?

A. Yes, sir; I think those arrangements are so common that it is almost a rule to adopt that as a standard."

4038 You are not familiar with this wheelage basis for the division of maintenance of way expenses between railroads in the maintenance of joint tracks, although these witnesses testify to it as a standard.

A. Not enough to know it is a standard or even that it is the general practice. And whether or not it is the standard, or the general practice does not in any way affect whether it is accurate or not.

Q. Are you familiar with the fact your road has leased a track from the Cotton Belt from Paragould North over which it sends only through freight trains?

A. In a very general way, yes.

Q. Do you know what basis of division is agreed upon between the Iron Mountain and the Cotton Belt as to maintenance of way of that track?

A. No, sir.

Q. You do not know that the car mile is used as the basis of division between those two roads?

A. No sir, my work does not bring me in contact personally with matters of that kind, or make it necessary for me to be very familiar with them. My work is in connection with the economical maintenance of the property and not property division between railroads.

Q. After accounting?

A. After accounting.

Q. You testified about the capacity of the operating man to design a system of accounting as against the accounting man,
4039 as I understand your testimony. I do not know whether I exactly caught your idea in this testimony. I wish you would re-state it for me, will you?

A. The purpose of accounting, as usually considered by the operating officers of a railroad, and one of the most important purposes in general, is to enable economy of operation to be obtained. Economy of operation can be obtained only by preventing waste and the operating officials have the best opportunity to see in what manner this occurs. They desire the records of the cost of operation to be so compiled and so prepared as to call their attention as quickly and as accurately as feasible, to the places where this possible waste is going on. The difficulty with any one who is entirely unfamiliar with operations compiling such a set of figures would be apparent almost on the face of it.

It has been found, in my experience, that the operating officials have been able to make a very great improvement in the system of accounting which has been in effect in the past, in order to make these accounts more useful in securing economy of operation. That is due to their great familiarity with the operations themselves and with what is necessary to be done to call their attention to these conditions.

Perhaps I can illustrate that: one of the old accounting systems, which I understand was prepared by accounting officials, sub-
divided the apportionment of maintenance of way expense
4040 into two accounts—repairs to road-bed and repairs to track.
Now, in an endeavor to secure economy of maintenance of roadway and track it was found that combining the expenses in this way did not produce information that was of any material value to the operating officials, and that partly because it did not separate the apportionment of expense which does not in any way vary with the traffic from the portion which does vary with the traffic.

The result of the operating officials taking hold of this subdivision of disbursements of maintenance accounts was to make a very decided difference in sub-dividing the expenses and to subdivide them on some-what different lines; the result is that the information obtained as a result of that re-arrangement is very

much more useful to the maintenance of way officials in their endeavor to secure economy of maintenance of way than it was before.

That improvement was brought about solely by the ability of the operating officials, through their knowledge of operation to tell in what way the old distribution was not satisfactory and in what way they needed the distribution of these expenses to be made so as to give them the information necessary to call attention to operations which were not normal.

Q. I believe, Mr. Byers, after hearing your explanation of that, there is less difference between you and the State's witnesses on that point than I had supposed.

4041 Have you read the testimony of Mr. Ludlam, given in this case?

A. I have read some of it, but I am not sure I have read all of it.

Q. I want to call your attention to this testimony given by Mr. Ludlam on page 1173 of the record in this case:

"My judgment is that the operating man, as a general proposition, is the last man who is able to figure out his own cost; that is done by the accounting department and by the various cost departments of the different manufacturing concerns.

Naturally, in installing a system of cost, we would confer with the operating man and familiarize ourselves with the operating transactions sufficiently to be able to devise forms and install systems that would take care of all the operating transactions, but we would never depend upon the operating man's opinion of what it would cost him."

Do you agree to those propositions?

A. No, sir.

Q. Wherein do you disagree with them?

A. I disagree with the statement that the operating man is the man who is least able to figure out his own cost, for one thing. I do not think that is true. It may be true of some operating men and it probably is true to a very considerable extent of the old type of operating men, as I explained in my direct testimony, because he was operating with such small units that he did not need statistics in order to assist him in studying his operations.

Q. Mr. Ludlam develops that very thought a little further, to which I will call your attention. He testified:

4042 "There is nothing that is more generally recognized, I think, and coming to be recognized more and more every day, than the absolute importance of separating the operating and the accounting departments, particularly in railroads."

You agree to that, don't you?

A. I think it is necessary to separate the operating and the auditing departments.

Q. I presume he is using those terms synonomously?

A. I think there is a distinction between the accounting and the auditing departments. The duty of an auditing department is the same as the duty of a bank examiner, to go through the bank and examine the operations of that bank.

Q. I see your distinction, but in practical railroad operation the accounting and auditing departments are the same department, are they not?

A. They have that title, but their duties are by no means the same.

Q. They have both duties.

A. To a certain extent they have both duties.

Q. To go a little further on this point I will read you from Mr. Ludlam's testimony where he says:

"I can remember back in my day when the General Manager would instruct the Auditor how to charge certain expenses, but the financial interests, insofar as they control railroad accounting and railroad investments, have learned that it is imperative that the accounting officer should act exclusively on his own responsibility and be accountable only to the Board of Directors of the corporation, if you want to know the actual facts as to the result of operating the property.

Any operating man could make a very fine showing for his property if he was allowed to direct how the different items should be charged."

4043 Do you agree with this statement of Mr. Ludlam?

A. I think it misrepresents the situation. In my opinion it would be more proper to regard the accounting department as a branch of the operating department. The accounting, in my opinion, is simply a portion of the work of the operating department. But it is also, in my opinion, and I think in the opinion of the witness whose testimony you have read, absolutely necessary to have an independent auditing department. That independent auditing department should not in any way be an operating department; but its primary function is that of auditing and not of operating or otherwise managing the accounts. It is simply there for the purpose of seeing that things are done in the way they should be done, and not for the purpose of doing them. So far as it undertakes to do the work then it is destroying its own value as an auditing department, because then there is no department of the railroad to audit the accurate compiling of the accounting, which is just as necessary in one case as in another.

They are frequently combined as a matter of convenience, but when you deal with the principles involved, it is, in my opinion, wrong.

4044 Q. I want to read from this one authority and see if you agree with it:

"The objects sought by accounting reports are three-fold:

First, to enable owners of the property to judge as to its value and as to the efficiency of management.

Second, to enable officers of all grades to secure economical results in that portion of the Company's operations entrusted to their charge.

Third, to prevent dishonesty."

You agree with that?

Mr. MOORE: From what are you reading?

Mr. HILL: You know what I am reading from, Mr. Byers?

A. I think you are reading from the very first draft of some data which I dictated for the purpose of clarifying my own thoughts on the subject, and not with the idea that when they were written they would be either right or wrong.

Q. Do you agree to those propositions?

A. Read it again, please.

Q. (Counsel reads).

"The objects sought by accounting reports are three-fold:

First, to enable the owners of the property to judge as to its value and as to the efficiency of the management."

A. That is one object of the accounting.

Q. Counsel reads.) "Second, to enable the officials of all grades to secure economical results in that portion of the Company's operations entrusted to their charge."

A. That is another portion and a very important portion.

4045 Q. (Counsel reads.) "Third, to prevent dishonesty."

A. That is still another portion.

Q. You agree with all that statement, then, do you not?

A. I think that is in error in one way. Further consideration brings to my mind the distinction between accounting and auditing.

The object of a system of accounts is to cover all of those features and possibly some others. But the object of an accounting department is not necessarily to do that. The object of the auditing department is very largely the last—to prevent dishonesty in accounting and to a certain extent otherwise.

In a general way, I think that is correct.

Q. I want to read you the following paragraph which I believe is much in the line of what Mr. Ludlam says and I do not know it is out of line with what you say:

"In the day of the small railroad the general official in charge of operation was able to personally see to and regulate most matters of detail and required but few reports to enable him to keep closely in touch with the situation. Today, with from 5,000 to 10,000 miles of road under his control, he is helpless to personally regulate operations. He employs superintendents of divisions and general superintendents of grand divisions, to attend to the details of active operation; and his own time is taken up with the regulation of the general policy and with the study of the results obtained by his subordinate officials.

To guide him therein he must have statements of the amounts of cost of work done—not the individual items (which he could not possibly find the time to consider) but the amounts of cost of great groups of items—and on the skill with which such data is made depends the value of the deductions therefrom."

4046 A. That represents my present ideas on the subject.

Q. Do you think that the operating man whom you have pictured there very accurately has the skill with which to make selection of such data as would enable him to obtain results from his subordinate officials, when he has devoted his whole lifetime to the matter of direct railroad instead of to the matter of accounting?

A. The question is so worded that I am not quite sure as to its meaning. Whom do you mean by the man who has devoted his whole lifetime to such matters? Do you mean the minor officials?

Q. I am using this general official whom you have pictured in this book of yours.

A. And not his subordinate?

Q. No, sir.

A. Oh, I think he should certainly be able to determine with greater or less degree of accuracy the things he needs. But about all that this information which he will obtain does, is to call his attention to abnormal conditions, instead of his being obliged to examine into every operation of a railroad, which it would be impossible for him to do, he is able to confine his attention to investigating personally or through his subordinates the abnormal operations.

Q. You have explained that. There is no difference between us on that. But the question is, who should install the system? Not the benefit it would be to the operating man. We are all agreed on that.

4047 A. You wish me to say who should install it?

Q. Yes, who should install such a cost system for a great railroad.

A. I think the system should be designed by a committee representing every branch of the railroad service, in order that all phases of the question might be considered.

That means they must be men with expert knowledge of the question, of bookkeeping and must be men with expert knowledge of the theory of accounting, and must be men with expert knowledge of every branch of operation.

When you work out a system of accounting that is criticised by that sort of intelligence, then you get a system that is about as successfully designed as can be. No one man can do it.

Q. I agree with you. If any one man did it he would have to get his information from all these departments of which you have spoken?

A. Yes, sir, and he would not live long enough to get that perfect knowledge.

Q. For himself?

A. Yes, sir, and the different men get it through their individual specialties.

Q. If you left it to anyone man you would not leave it to a general superintendent or a general manager?

A. I think then I would study the individual. In some cases I would leave it to the operating man. I would consider

4048 his general knowledge of operations and his knowledge of accounting, and as against that I would consider the accountant's knowledge of at least his own work and his knowledge of operations.

But my own experience with systems which have been designed by accountants has been so entirely unsatisfactory, and I found the information I could obtain in that way has been so worthless, that I

cannot help leaning a little bit—and I am probably prejudiced a little bit, in the other direction.

Q. You say on page 565 of this book "In addition to auditing accounts, the auditing department is usually required to prepare most of the statements required by the Traffic Department, these statements being made up from the information contained on the revenue waybills.

In some cases, also, the work of the Freight Claim Department, which usually is under the direction of the Traffic Department, is performed by the Auditing Department."

That is another branch of work placed upon the Auditing Department, is it not, which would familiarize them in a measure with that branch of the subject?

A. Yes, sir, it would familiarize them to an extent to enable them to compile the information. But the compilation in one case has been turned over to an electrical machine, as I have stated, which indicates it is not a very important matter.

Q. That is the work of compilation but not the work of installing or designing a system?

A. Of course, the system was not designed by a machine.

4049 Q. Your testimony of Saturday would rather leave the impression that the electrical machine had designed the system. Of course, I do not so understand it.

A. That would be almost as absurd as the testimony here, which would indicate that an operating man does not know anything about his operation.

Q. No, it does not indicate that, but it indicates that he should not be left to determine his method of accounting of his operation.

A. I think that would be about as absurd as entrusting a machine to do it.

Q. Do you know on the Wabash Railroad that the Auditor reports directly to the President, and the General Manager has nothing to do with that?

A. I do not know anything about that. I do not question it.

Q. At page 99 I find this statement:

"Sometime after the Interstate Commerce Commission was established, it, for the purpose of making possible the comparison of the operating expenses of the different railroads, issued instructions that annual reports of earnings and expenditures be made to it by each corporation in certain form, which it laid down. This form was the result of the meeting of a number of the representative railway accounting officers of this country, and their work marked the first great advance in the art of railroad accounting."

Do you subscribe to the statement there?

A. That is a statement as of what period of time?

Q. I don't know. I am reading from page 99 of a work called "Economies of Railroad Operation" published in 1908. I

4050 presume you are familiar with the work?

A. I am familiar with it and it refers to a period of some twenty odd years ago. At that time the whole system of accounting was in a state of chaos and also at that time the railroads were very much smaller than they are now; and at that time the operating

officials were as a rule of rather a different character from the rule of operating officials of the present time.

Now, as to the extent to which the accounting officials were operating officials before they were accounting officials, I am not prepared to say but I think as a rule that they were.

Q. You do not think very highly of the ability of the accounting officials to devise an accounting system, do you, Mr. Byers?

A. Not unless the accounting officer has very thorough knowledge of operation, acquired how it may be—in other words, the position does not mean anything. It is a question of what the man knows.

Q. Do you know Professor Adams of the Interstate Commerce Commission?

A. Yes, sir.

Q. Do you know whether he has ever had any operating experience?

A. I don't know whether he has or not, but I do know that in the discussion of our revision of accounting, Professor Adams indicated to my mind that if he were alone to devise a system of accounting for railroads it would not be a very satisfactory system.

4051 Q. I suppose any accountant would have to do that, lean upon an operating man in all branches to make any intelligent division?

A. May I continue my statement?

Q. Yes.

A. In fact, Professor Adams has forced the injection of certain data into the system of accounting which the railroads are compelled to follow, which has met with universal criticism by railroad officials.

Q. I do not think there is any doubt about that.

A. And it has been found very unsatisfactory for the purpose of analyzing and securing economical operations.

Q. I will rest the case of the operator against the accountant here. You are the author of the book I have been reading from, Mr. Byers?

A. Yes, sir.

Redirect examination.

By Mr. MOORE:

Q. Mr. Byers, who is the author of "Economics of Railroad Operation" from which counsel has read extracts on your cross examination?

A. I believe I am guilty.

Q. If you have sufficient knowledge of that branch of the business of railroads and the basis upon which contracts for trackage rights owned by one railroad and leased to another to testify upon

4052 the subject, I would be glad if you would state if it is not a fact that in contractual arrangements of that sort a profit over and above the actual expense may be involved to the leasing line, is usually provided to be paid for by the line which leases it.

If you are not sufficiently familiar to go into the subject I do not

care to have you do so but if you are competent please give us your opinion.

A. My experience with that branch of railroad work is so limited I hardly feel competent to go into it.

Q. Mr. Byers, I suppose there is such a thing, is there not, as "primary accounts" which reflect, you might say, with reference to expenditures the facts of operation: Am I correct in that statement?

A. The statistics of operation as represented by accounts are usually divided into various divisions of greater or less importance. The more important ones are sometimes termed "primary accounts."

Q. The point I want to get at is this: Accounts are intended to and do reflect facts, do they not?

A. Yes, sir.

Q. And the facts reflected, intended to be shown by the accounts, are the cost of operation in the various branches in the accounts in which they are kept, are they not?

A. Yes, sir.

4053 Q. If it is true that the accounts are intended to represent facts and those facts are the various items of cost of operation, it is essential that the man who prepares the accounts should know what the different elements of cost are, and what the cost involved in the various branches of the service as shown in the accounts, to the extent that the cost is kept separately and shown separately in his accounts: is that not true?

A. I think that is true of the man who designs the accounts.

Q. I am not speaking of the designing but of the practical keeping of the accounts: If the accounts represent facts, the accounting man must know or obtain from someone else the information which would reflect the facts they are intended to represent: that is true, is it not?

A. Yes, sir, that is true.

Q. If an accounting official has no knowledge of operation where does he get the information as to the facts represented in his accounts?

A. He must take the facts as they are presented to him by the operating employés.

4054 WILLIAM H. V. ROSING, a witness of lawful age, being duly produced, sworn and examined on behalf of the complainant, in rebuttal, testified as follows:

Direct examination.

By Mr. MOORE:

Q. State your name, residence and occupation?

A. William H. V. Rosing, Mechanical Engineer Missouri Pacific Railway, at St. Louis.

Q. You live in St. Louis, I suppose?

A. Yes, sir, my headquarters are in St. Louis.

Q. What experience have you had in railroad operation and work?

A. I commenced in 1880, on the Illinois Central as machinist's

helper. I left the shop in 1883 to take the position of draftsman. From 1884 to about 1887 I was chief clerk in the machinery department.

From 1887 to 1891 I was chief draftsman in the Machinery Department.

From 1891 to 1892 I was Assistant Master Mechanic of the Chicago Division.

From 1892 to 1893 I was Mechanical Engineer of the Grant Locomotive Works at Chicago.

4055 From November 1893 to 1894, Mechanical Engineer of the Illinois Central, again.

From 1894 to 1898, Master Mechanic of the Denver & Rio Grande Railway at Denver.

From 1898 to 1899 I returned as Mechanical Engineer to the Illinois Central.

From 1899 to 1904, Assistant Superintendent of motive power on the Illinois Central.

1904 to 1910, and at the present time, Mechanical Engineer of the Missouri Pacific.

Q. You have been engaged, then, for thirty years in the character of work mentioned?

A. Yes, sir.

Q. You seem to have been in pretty much all the departments of that character of work?

A. Yes, sir, all branches of the machinery department.

Q. Mr. Rosing, the defendants have filed an exhibit in this case (Exhibit K) in which, among other things, they attempt to divide expense of maintaining freight cars as between local and through trains, and in dividing those expenses between those two classes of trains they have taken into consideration the element of repairs due to stopping and starting trains at way stations and repairs due to terminal handling of through trains and trains in local service.

Following the formula set out by Mr. A. M. Wellington, in a book written by him, bearing the title of "Railroad Location" they have divided expense of maintenance of freight cars on this

4056 basis:

Stopping and starting, 21.5% of the total expense on that account.

Terminal handling 13.5%.

Other expenses 65%.

And those elements of cost have been divided on that basis by the State on this exhibit.

Have you examined the exhibit so you are familiar with the method of division to which I have called your attention?

A. Yes, sir.

Q. Will you state if the percent of allowance for stopping and starting and other terminal handling adopted by the State is correct?

A. I do not agree with the percentages given in Mr. Wellington's book, a copy of the edition of 1887 of which I have here before me.

Q. That is the edition of 1887: when was the book written?

A. There is reference in the preface here to the book having been written ten years before.

Q. That preface refers to a book written ten years before in 1877?

A. Yes, sir.

Q. State in what you disagree and your reason for your difference in view to that adopted by the State?

4057 A. This claim in table 86 on page 203 of A. M. Wellington's book in the 1887 edition gives the total cost of items and divides the items into various parts of railway cars and gives the percentage of cost of repairs, and the percentage of cost to the total cost of each of the items.

There are some of these items that so far as my observations go should be combined. For instance, he shows an item of drawbars as separate from sills and attachments. In figuring our cost or in judging of the cost of these items we combine them in one item because they are parts of an integral portion of the car forming the draft gear equipment of which the drawbar is only a portion.

Q. You are reading now from the edition of 1887?

A. Yes, sir, on page 203 table 86. The table is "Distribution of cost of freight car repairs to its various contributing causes."

The item of brakes shows that 5% of the total cost of repairing cars is on account of repairs to brakes.

At the time this book was written, say in 1877—or take this edition in 1887—freight cars during that period had brakes only on one truck, and the brake operated by hand. Since then all of the brake rigging has been changed and none of that old brake rigging is applicable to any car today. We are obliged to apply brakes on both trucks, and we are obliged to operate them by air pressure.

So the entire brake arrangement is quite different and the maintenance of it is very much more than is referred to in Mr. Wellington's table.

4058 The item of drawbars and sills and attachments is shown at 15% in the table here (indicating book). Today that will amount to at least 35%, in my opinion.

The drawbar arrangement is entirely different from the cars referred to, as well as the attachment to the sills; and on account of the heavier equipment it is practically between two and three to one of what was in those days. And the engines increase in still larger proportion. We have more repairs to do on those items than is shown in the table of 1877.

There is a foot note on page 203 under table 86 which states that the "proportionate cost of wheels, axles and brasses, which are the first two items in the table, is perhaps large, and that the brakes and drawbars are small, but it is in accordance with the best obtainable information."

I think that is a fact and that would be a fact today, on a proportionate basis.

The wheels which he quotes at 30%, I think 18% would be perhaps nearer right.

The axles, brasses and boxes, which he also quotes at 30%, I should say 22% would be nearer correct.

Springs are also high. He quotes springs at 10% and I think perhaps half of that would be sufficient.

The truck frames and fittings 5%, I think is about correct.

Drawbar sills and attachments instead of 15% I should say should be 35%.

4059 Q. State what you would say would be a fair proportion of that element of expense to attribute to stopping and starting?

A. I should say that the stopping and starting would amount to between 30 and 32%—well, I should say about 32%.

Q. That is your best judgment?

A. Yes, sir, as near as I can judge the proportion.

Q. What percent of the expense should be charged to terminal handling?

A. About 25%.

Q. I wish you would describe somewhat in detail the new appliances and devices which have been introduced since the time Mr. Wellington wrote that book and which you think affect the percent applicable to this cost. State it in some detail. Give some description of what it is and how it operates that way.

A. In general the details of the cars as we build them today are quite different from even fifteen or twenty years ago. Take the cars say in 1880 when I commenced and am familiar with—the largest car I knew of at that time was 40,000 pounds capacity and that was a special coal car for special service at one mine. There may have been some other 40,000 pound cars at that time but I do not recall them.

Those cars were all of wood construction and the brakes were operated by hand, and ordinary wooden brake beam, and with brakes on only one truck of the car and cars were equipped
4060 with cast iron link and pin coupler.

The greatest change in cars today is their draft appliances, air brakes and master car builders couplers.

In order to resist the increasing capacity of locomotives and greater loads of present cars these parts underwent numerous changes in design and construction, depending largely upon the different views of the mechanical men handling matters, and finally culminated in the adoption of one kind of coupler which is known as the "Master Car Builders Coupler" or a coupler designed to be uniformly interchangeable for freight cars, and the adoption of air brakes instead of hand brakes, for all freight cars.

The car body, while made larger, is in principle much the same as the old cars. The trucks are somewhat different and somewhat simplified, and of course, are made heavier and of different materials than they were in 1880.

Q. In what way has all this difference in construction and the use of these devices increased this element of expense for repairs?

A. The application of the air brake has added all our present air brake equipment, including the air brake cylinders, valves, pipes, levers, brake beams, etc. This is all additional equipment to be

maintained because we are still obliged to maintain the hand brake connected with this air brake apparatus.

The air brake, of course, is applied whenever the train slows down, while formerly a brakeman who rode in the engine and was known as the head man, when the train was brought to a stop, would
4061 probably go back and set the brakes of four or five cars, to set the hand brakes, and if this was not sufficient to stop, the engineer would probably do the rest by reversing his engine, regardless of the number of cars in the train. With air, the engineer sets the brakes on all the cars in the train at one time. Therefore, the use of the air brakes is a complete addition to what we formerly had.

The change to automatic draw-bar, which couples by impact, without employés or operatives going in between the cars to make the coupling, has been the source of a great deal of expense, on account of carelessness, resulting in damage in handling the cars in stopping and starting and switching.

Q. Speaking now of stopping and starting: That is an element which you say amounts to thirty-five per cent?

A. Yes, sir, stopping and starting and coupling, in making up and breaking up trains. The damage is very much greater. I don't know that I can give the exact percentage, but it is very much greater. It became manifest right away; just as soon as the cars were equipped with draw-bars the damage commenced immediately, and was very perceptible.

Q. Do the brakemen have occasion now to go in between the cars in stopping and starting, to couple them?

A. No, sir.

4062 Q. What effect did that change from the draw bar to the automatic air brake have?

A. Just the change which came about from the general carelessness of the operatives or employés where they are not in danger. They let the cars come together faster than they did before, all contributing to shocks, the result of which finally is damage to the cars.

Q. You mean in handling the trains the engineers would not exercise that degree of care that was necessary to protect the lives of brakemen when they did the coupling?

A. It would not be particularly the engineer. The engineer is the man handling the engine, but he handles it on signal from the trainmen or switchmen and he works according to the signals he receives. Naturally if the brakeman was going to couple up cars automatically, he would signal the engineer to move and perhaps not be quite as active in signalling him to stop but let them come together at no matter what speed, because he does not have to go between the cars to make the coupling.

Q. Is that carelessness or only the result of the substitution of a machine for human help?

A. It is carelessness to some degree, but the heavy equipment also contributes to damage to a certain extent. Two heavy cars coming together at what is known as ordinary switching speed

would ordinarily do more damage than two lighter cars coming together at the same speed.

4063 Q. The impact is greater, I suppose, in the heavier cars?

A. Yes, sir.

Q. Is there any difference in the strength of the material of which the cars are made now, that enters into this increased element of cost of stopping and starting?

A. The materials in the cars have been improved in our present cars. We have substituted stronger material than what was used in the lighter cars.

I don't know as there is anything in the character of the materials that would contribute one way or the other.

Q. You spoke of the weight of the car. Is the weight of the car affected by the increased size or being constructed of heavier material?

A. Both. But particularly in the increased capacity for carrying the load. Where we had a 30,000 pound coal car in 1877 we now have 100,000 pound cars.

Q. Does that increased weight have any effect on the impact?

A. Just in proportion to the increased load, yes.

Q. You have been speaking now with reference to the per cent of cost of stopping and starting:

I believe you stated that the terminal handling would constitute about twenty-five per cent of this element of maintenance: will you please state in what way that has increased?

4064 A. In the handling of cars, switching and making up trains.

Q. What you have said in regard to starting and stopping applies with equal force to the handling of them in the yards, does it not?

A. Yes, only that the air brakes would not be applied so frequently in terminal switching as in the local work at stations or the running of trains, and the starting and stopping.

Q. Your ideas in that respect are about the same as Mr. Wellington's, are they not?

A. I think in a general way the ratio of starting and stopping would be 60 per cent and terminal switching 40 per cent of the sum of those two items; and Mr. Wellington's figures give it within one-half of one per cent of that. That is, so far as the ratio is concerned.

Q. State how much of the expense that should be charged to starting and stopping and how much to terminal handling. That is the point I am trying to get at.

A. Taking starting and stopping here, it is 21.5 per cent (indicating Mr. Wellington's book).

Q. I am not speaking of that. What I want to know is what percentage you say should be charged on account of this stopping and starting, and what per cent should be charged on account of terminal handling?

A. I think about 32 or 33 per cent for stopping and starting and about 24 or 25 per cent, say, for terminal handling.

4065 Q. And the changes in the weight and character of the cars as you describe, the changes in the devices and appliances for handling them and the change in the manner of handling them, that has grown out of the change in these devices and the manner of handling them, is what has brought about this change in cost?

A. Yes, sir.

Q. Have you made a careful investigation of this and are you satisfied that your estimate is correct?

A. They are what we use in our estimating. We keep in touch with all the performance of work on our car repair work, make trips over the road and see about what work is being regularly performed on our cars, and we think we have the percentages about correct. We repair about three thousand cars every day.

Q. And that is the per cent that obtains on the Iron Mountain road?

A. I should say so, yes, sir.

Q. Is that the condition that existed three years ago, in the year 1907?

A. Yes, sir, just about. There was a change not long ago of where we were obliged to couple up the air on about fifty per cent of the cars in a train. I think that was recently changed to seventy-five per cent of the cars. However, since the air brake rule first went into effect by order of the Interstate Commerce Com-
4066 mission, we have been applying air brakes, just as many as we could, and trying to get them on all cars.

Q. So your percentage that you speak of now is about the same as existed in the year 1907?

A. Just about.

Q. The remaining expense, then, would be forty-three per cent, excluding stopping and starting and terminal handling?

A. Yes, whatever that difference would be.

Q. Starting and stopping you state was thirty-two per cent and terminal expenses would be how much? Did you say twenty-four or twenty-five per cent?

A. Twenty-four per cent.

Q. Then that would leave forty-four per cent chargeable to other causes?

A. Yes, sir.

Q. You spoke a while ago about the manner of handling the trains and you used the word "carelessness"—on account of, perhaps, carelessness in handling or the signalling of the brakemen: Do you refer to carelessness on the Iron Mountain road or just that general carelessness inseparable from the use of the present kind of appliances on railroads everywhere?

A. Perhaps carelessness does not just explain it. A man does not deliberately go to work and smash cars together. But in view of the fact that a man does not have to go between the cars
4067 to couple them, he would probably be more liable to let the cars come together with a little more force than if he had to go between those cars.

Q. You speak now of the brakemen as giving the signals?
A. Yes, sir. That, together with the heavier car equipment, creates a greater expense.
Q. And the increased expense of keeping up the new appliances and devices?
A. Yes, sir.
Q. It does with the three elements?
A. Yes, sir.
Q. Is there a considerable outlay necessary to keep up these later devices which you say have been adopted since 1880?
A. Yes, it has increased the cost of repairs to cars right along on account of the added parts requiring attention.
Q. There being more parts to keep in repair?
A. Yes, additional parts as compared to the parts on the old cars.
Q. Mr. Rosing, how does the expenses of repairs on passenger coaches and on mail and express cars compare?
A. I should say that a mail car would perhaps cost fifteen to twenty per cent more to repair than an express car; and that a coach would cost at least 100 per cent more.
Q. More than the express car?
A. Yes, sir.
Q. The state, in Exhibit M filed in this case, has divided the expense of car repairs on passenger train cars between coach,
4068 mail and express service, upon a car mileage basis: is that a fair method of division?
A. No, sir.
Q. Why is not fair?
A. Because it costs twice as much to repair a coach as it does to repair an express car for the same mileage.
Q. Under the head of "Yard and train expenses" the state has divided between coach, Pullman, mail and express service, on a car mile basis:
Is it proper to divide that character of expense on that basis—car mile basis? I will assume that that item includes cleaning the cars.
A. Terminal expense?
Q. The "yard and train expenses" are divided between coach, Pullman, mail and express cars and that includes cleaning?
A. That would be just as far off as this other.
Q. Do you know about what per cent of that class of expense the cleaning would amount to?
A. The cleaning of a coach with reference to the other cars?
Q. With reference to that element of expense, yard train expense?
A. We clean cars at a passenger terminal whenever a train arrives, regardless of where it comes from; whether it came one mile or one hundred miles it makes no difference; we go through a regular performance and put that train in condition to go out
4069 again. We don't go by the condition in which the car came in, to prepare it to go out, and the same amount of work is done regardless of how many miles it has traveled.
To clean an express car there is nothing to do but sweep it out;

but to clean a coach, as we have on all coaches double windows and we have all those to clean——

Q. I will come to that in a moment. For several reasons you do not regard the car mile basis as the best method of dividing yard and train expense on passenger trains?

A. No, sir.

Q. What proportion of the total yard and train expense on passenger trains would the cleaning amount to?

A. The total percentage?

Q. Yes, of the cleaning of all classes of cars. What percent would it come to of the entire yard and train expense?

A. I cannot say what percentage of the yard and train expense.

Q. I want you to take up these different kinds of cars now, and state what the relative cost of cleaning them is: coach, Pullman, mail and express cars?

A. In the express car we only sweep them and what washing up would be necessary to make them presentable in appearance, because the express car consists merely of four walls and the roof and floor and there is no other equipment in it.

4070 In the case of a mail car we have the bag racks and letter boxes, which require some attention but not very much. It probably cost- ten or twelve per cent more than it would cost to clean an express car.

In the case of a coach we have the exterior as well as the interior to clean, and in addition the windows, seats, curtains and all the deck appliances, sash, etc., which amounts to probably 150 per cent more expense than to clean an express car.

Q. I wish you would give us the figures as to what you estimate it costs for cleaning each kind of car. Take a coach first.

A. To clean a coach every time it arrives at a passenger terminal would amount to probably $1.45 per car.

To clean a mail car would be about 65 cents. To clean an express car about 55 cents.

I think that is about our average cost.

Q. How does cleaning a baggage car compare with cleaning an express car?

A. A baggage car is about the same as an express car. That is to say, the car may be used for either class of service or for both.

Q. In the same exhibit referred to, the state has charged and divided the expense of repairing passenger locomotives between coach and Pullman, mail and express service, on the car mile basis:

4071 Is that a correct basis of division?

This is done without any attempt at separation as between the two classes of service—that is, the local and through passenger service; but the expense of repairing all locomotives without regard to whether they pull a through or a local passenger train is divided in the way I have mentioned: what do you think about that?

A. I do not think that is correct.

Q. State your views about that, Mr. Rosing.

A. The repairs to a locomotive should be apportioned to the work

done by the engine and unless all those cars were exactly alike then the division cannot be made on a mileage basis with reference to these cars.

Q. What is the weight, relatively, of those classes of cars?

A. Take an express car: it will weigh about 35 tons, while the coach would weigh perhaps 45 tons. A chair car would probably weigh 50 tons. A sleeper will weigh from 60 to 70 tons.

The repairs of an engine depend entirely upon the work done by the engine, and the work done by the engine depends upon the load it hauls.

Q. Do you include baggage cars?

A. Yes, sir, they will weigh 35 tons.

Q. Do you include express cars?

A. Yes, sir. The express car would be the same.

4072 Q. That expense should be apportioned among those classes of cars in relation to their respective weights: is that your view?

A. Yes, sir; and the mileage.

Q. Mr. Parker, a witness on the part of the state in this case, testified that the report of the American Railway Engineers & Maintenance of Way Association of 1904, shows a statement of cost of locomotive repairs on the Union Pacific Railway and that the cost of freight and work engines on account of getting up steam in terminal work was 7.35 per cent.

Cost of switch engine, 12.47 per cent.

This he says refers to locomotives, while Mr. Wellington refers to freight cars.

He says further:

"Mr. Wellington shows 21.5 per cent of this expense is on account of stopping and starting at way stations, while this report shows twenty per cent. Mr. Wellington shows 12.5 per cent for terminal handling and this report 16 per cent."

Are you acquainted with that report? You have seen it, have you?

A. Yes, sir.

Q. Will you state what that report is and what the real facts in regard to it are?

A. I should say that the report (which was made by the Maintenance of Way Association not Mechanical or Operating Association) evidently applied the Wellington formula for a divis-

4073 ion of the expense, because it was practically the same thing as the Wellington formula. In addition, however, they show certain figures relating to passenger equipment, and that table shows that the cost to repair passenger cars on account of stopping and starting is just as much as for freight cars. But I don't see how it can possibly be one-fourth of the cost of repairing freight cars, so I do not see they are any nearer right on their passenger than on their freight cars. It certainly costs a great deal more to repair the draft rigging on the freight cars, relatively, than on the passenger cars.

Q. You say it is evident that the report is based on Mr. Wellington's figures because they are the same:

I wish you would state whether the report states on what it is based and that they adopt Mr. Wellington's formula.

A. I think there is a note in the report that it was based on Mr. Wellington's formula.

Q. Do they discuss in there the correctness of that formula, or do they adopt it without discussion?

A. I do not recall any discussion of it. There might have been some. I only used the table to make a comparison with the Wellington formula. It seems to me it was the same thing only they added passenger cars, and in my opinion that is further wrong than on the freight cars.

4074 Cross-examination of W. H. V. ROSING:

By Mr. HILL:

Q. Mr. Rosing, have you your copy of Mr. Wellington's work before you?

A. No, sir, I did not bring my copy but I think I have some memorandum of the table.

Q. Have you a copy of his table 86?

A. Yes, sir, I have a copy of that.

Q. I wish if you have that copy you would read that into the record.

A.—

| Item. | Total cost of item. | Distribution. Effect of time and age, independent of work and mileage. | Stopping and starting. | Terminal making up trains, etc. | Curvature and grades. | Distance only between stations on straight track. |
|---|---|---|---|---|---|---|
| | p. c. | p. c. | p. c. | p. c. | p. c. | p. c. |
| Wheels..... | 30 | | 5 | 2 | 13 | 10 |
| Axles, brasses and boxes.. | 30 | | 5 | 2 | 5 | 18 |
| Springs..... | 10 | | 2 | 1 | 1 | 6 |
| Truckframe and fittings.. | 5 | 2 | 1 | 1 | | 1 |
| Brakes..... | 5 | | 2 | 1 | 2 | |
| Drawbars.... | 10 | | 4 | 4 | 2 | |
| Sills and attachments.. | 5 | 1 | 2 | 2 | | |
| Car body, painting, etc..... | 5 | 3 | 0.5 | 0.5 | | 1 |
| Total..... | 100 | 6.0 | 21.5 | 13.5 | 23.0 | 36.0 |

4075 Q. Mr. Rosing, referring to table 86 which has just been read, as I understand your testimony yesterday, you differ with Mr. Wellington as to the percentages in the first column, which is the total cost of each of the various items therein set forth aggregating the total distribution of the cost for freight cars repairs to these various contributing causes?

A. Yes, sir.

Q. But if I understood you correctly you do not disagree with Mr. Wellington as to the proportion which he distributes to starting and stopping, on each item; is that correct?

For instance, you take wheels, which Mr. Wellington gives as 30% and which you say should be 18%: in getting the percentage of expense of starting and stopping for that cause, as I understood, you would agree with Mr. Wellington's proportion except you apply it to 18% instead of to 30%: is that right?

A. What I understand you to mean is, that Mr. Wellington names certain items to which he distributes the cost. Of course, if you want to distribute it among those items you would have to use those same ones now for comparison. But in the distribution of items I do not think those headings are at all applicable to our present car construction, but for the sake of the division we will accept those headings as they are.

Q. That is not exactly the point I am asking you about. The point I am asking you about is this: this first column gives
4076 the distribution as Mr. Wellington sees fit and proper to distribute it: now you disagree with him as to the percentages which should go into that column?

A. Yes, sir.

Q. And as stated in your testimony yesterday?

A. Yes, sir.

Q. I understood you to say that the relative proportion assigned to starting and stopping you did not disagree with?

A. He shows 21.13% and I show 32.23%. Those are relative.

Q. I am speaking now of the individual items, Mr. Rosing. I understand your total. I am coming to that in a few minutes.

Take wheels, now, to illustrate my point.

Mr. Wellington puts that at 30% and you put it at 18%?

A. Yes, relatively. I think I understand you now.

Q. You understand that?

A. I think so.

Q. As to these various items he has given under "Stopping and starting" you disagree with the result, but agree with the relative proportion as assigned to starting and stopping: is that right?

A. No, sir; that is not right. Take the two percentages he gives for stopping and starting as 21.5 and 13.5 or a total of 35%——

Q. You are going to the question of totals but——

4077 A. (continued). Now, the relation of 21.5 to 35 and of 13.5 to 35 is about as my 32 is to 55 and my 23 is to 55. That is the relation I referred to in my remarks yesterday.

Q. I understand your difference with him as to results. But I am talking now about the apportionment of your given percentage as to starting and stopping.

Take the first item, wheels. Mr. Wellington gives that as 30% and you say that is too much and that it should be 18%?

A. Yes.

Q. Mr. Wellington gives 5% of the percent apportioned to wheels as due to starting and stopping?

A. Oh, I see now.

My figures do not agree with him in respect to that. My arrangement is different from his.

Q. He gives 5%, which is 1/6 of that cause: what percent do you give?

A. I should say 2%, or 1/9.

Q. Take the next item, "Axles, brasses and boxes." Mr. Wellington gives 30%, one-sixth of which he assigns to cause for stopping and starting: what do you assign it?

A. I should say 22% and 1/11 due to stopping or starting, or 2%.

Q. In the item of "Springs" Mr. Wellington assigns 10% and I believe you assign 5%?

A. Four I have it in my table now.

Q. 5% you gave in your testimony yesterday?

A. I may have said 5% but after figuring this out I fig-

4078 ured it out as 4%.

Q. You want to correct that and make it 4%, do you?

A. Yes, sir.

Q. What per cent of that 4% do you assign to stopping and starting?

A. 1% or ¼. And Mr. Wellington shows 2% or 1/5.

Q. The next item is "Truck frames and fittings": Mr. Wellington assigns 5% and I believe you agree with it?

A. I assign 6%. I have changed the equal per cent due to truck frames and springs from 5% for each to 4% for trucks and 6% for springs. I think that would be nearer right.

Q. You change that from your testimony of yesterday from 5% to 6%, do you?

A. Yes, sir.

Q. Did you give me the percentage of that 6% which you assign to starting and stopping?

A. Yes, sir, one-third or two per cent.

Q. The next heading is "Drawbars, sills and attachments":

A. You omitted brakes, if you wish to take them up separately?

A. Thank you, yes, I want to take them up in their order.

Brakes, 5%.

A. Yes, sir, and I have that down as 10%.

Q. You change that now to 10%?

A. Yes, sir.

4079 Q. You did not refer to that yesterday?

A. I think I made the remark "about double." I did not have any detailed figures then.

Q. You put that at 10% now: what per cent do you assign of that to starting and stopping?

A. 6%.

Q. 6% of the 10%?

A. Yes, sir. He had two per cent out of five per cent and I have 6% out of 10%.

Q. The next item is "Drawbars, sills and attachements"; Mr. Wellington makes 10% for drawbars and 5% for sills and attachments; what change do you make on that?

A. I make it 35% on that and 19% assigned to stopping and starting.

Q. Next is "Car body, painting, etc.": what do you make that?

A. Yes, sir.

Q. What does Mr. Wellington make it?

A. 5%.

Q. And you make it the same?

A. Yes, sir.

Q. Mr. Wellington assigns 1% of that as due to starting and stopping: what do you assign to starting and stopping?

A. I did not assign any of that to starting and stopping.

Q. What does that make your total percentage assigned to starting and stopping?

A. 32%.

4080 Q. In making this calculation what data have you used to compile it?

A. Principally my judgment of the case from experience and from supervising the work of that character for a number of years.

Q. This is just a matter of opinion with you?

A. And also in connection with the work done by what is known as the standardization of Equipment Committee of the Gould Lines, in which is represented nine railroads, which committee meets at certain intervals and discusses the standardization of equipment, for the betterment of our equipment and in a general way the improvement of our rolling stock. We discuss matters as to individual parts of the equipment, and take into consideration the service and the cost and in that way make the changes or otherwise in our specifications for engines or cars with a view of bettering the service and for the betterment of the efficiency of the equipment.

Mr. MOORE:

Q. Are you a member of that committee of which you speak?

A. Yes, sir, I am the chairman of it.

Mr. HILL:

Q. Has that committee ever worked out this table before?

A. No, sir.

Q. This is your first effort you have made to locate these expenses?

A. Yes, sir.

4081 Q. The first time has been in this litigation?

A. Yes, sir.

Q. And since you read the testimony of witnesses in this case?

A. Yes, sir.

Q. How long have you been engaged in this work?

A. You mean on this case?

Q. No, I mean this kind of work, in the mechanical departments of various railroads?

A. About thirty years.

Q. After thirty years' experience your first effort to locate these expenses has been since the introduction of the testimony in this case?

A. That is, the percentage of expense of this character. We have hundreds of items of which there are only four or five here. I do not see, exactly, at the time this table was made how they arrived at these things, except by judgment of some one person, who divided it up and made the comparisons of the percentages.

Q. Aren't you sufficiently familiar with Mr. Wellington's work to know that he states in the body of it somewhere that this work is the result of many years' experience on the Pennsylvania Railroad?

A. That is stated there.

Q. Mr. Wellington is regarded as an accepted authority on the subject, is he not?

4082 A. I think it is a very good book?

Q. And this table was made up from years of experience along these lines on the Pennsylvania Railroad: that is your understanding?

A. Yes, sir. But the table is so very different from our practice in these days that I do not see why it should have been so very different in those days.

Q. Are you acquainted with Mr. J. B. Berry?

A. I know Mr. Berry, the Chief Engineer of the Union Pacific Railroad.

Q. Formerly, but I believe he is now chief engineer of the Rock Island Railroad.

A. Well, I have met Mr. Berry on several occasions. I happened to be engaged with him at one time on some committee work.

Q. Is not Mr. Berry considered a man of large attainments in the line of his profession?

A. Well, I would not want to criticize a man in his profession, because his is an entirely different branch of engineering from mine. He is a civil engineer and I am a mechanical engineer. I do not know anything about his business.

Q. I was not seeking to draw a comparison between yourself and Mr. Berry.

A. No, but I do not like to speak of the qualifications of a

4083 man in another line of business—that is, of a civil engineer. I understand that Mr. Berry has a very high reputation in his business. I have always heard him spoken of as such.

Q. Mr. Moore questioned you yesterday about a report, which he called a report but I believe you did not call it a report, of the Maintenance of Way Association when in fact, it was a paper read before the Railroad Engineers and Maintenance of Way Association. Do you know that the report you were referring to was the work of Mr. Berry?

A. No, sir.

Q. You did not read his article containing that table?

A. No, sir, I just read that table that was spoken of in this testimony here.

Q. I will hand you volume 5 of the proceedings of the Railroad Engineers and Maintenance of Way Association.

A. I did see the table but I only noticed the figures in it and compared them with this testimony.

Q. I will offer you volume five of the report of the Railroad Engineers and Maintenance of Way Association of 1904 and call your attention to this article printed in the appendix, entitled "Reduction of Gradient, and Elimination of Distance, Curvature, and Rise and Fall on Union Pacific Railroad," by J. B. Berry, Chief Engineer of the Union Pacific Railroad, which you will find commencing on page 689. And therein I will call your attention to table three on page 695 which you see is a part of that article, and I will ask you if that is the table you referred to in your testimony yesterday?

4084 A. (After examining book:) Yes, sir.

Q. You examined the table but not the article containing it? Is that so?

A. Yes, sir.

Q. Now I see in your testimony yesterday you said,

"I should say that the report which was made by the Maintenance of Way Association or the Mechanical or Operating Association evidently applied the Wellington formula for the division of expense, because it was practically the same thing as the Wellington formula."

A. That should not be the Mechanical or Operating Association.

Q. You say you want to make a correction in that statement?

A. I wish the word "or" to be changed to the word "not." Making reference to practically the same thing I referred to that part of it relating to freight cars.

Q. Mr. Rosing, I want to read you what Mr. Berry says of the way in which these tables were compiled.

On page 692 he says:

"In order to determine the relative merits of different locations, values must be ascertained for each detail affecting operating expenses. "The Economic Theory of Railway Location", by Mr. A. M. Wellington, treats the entire subject fully. In this work Mr. Wellington has given to engineers a logical method of obtaining the values for distance, curvature, rise and fall and gradients, but the modern classification of operating expenses as adopted by the Interstate Commerce Commission gives these expenses in greater detail than could be obtained during the life of Mr. Wellington. This detail is of material assistance in following out Mr. Wellington's general method, as it lessens the chance for error in judgment as to the proportion of each item of expense which will be affected by changes in the details of location.

4085 Prof. W. L. Webb in his recent work on "Railroad Construction", has developed values for the various details, following the general method given by Mr. Wellington, but using the classification and figures given in the Reports of the Interstate Commerce Commission for the entire railway system of the United States. A study of these reports shows that the average cost per train mile in the more populous states is less than in the states west of the Missouri River.

In order to obtain a value of these details of location for the use of engineers in the Western states, the general methods of both Mr.

Wellington and Prof. Webb are applied in this paper to the operating expenses of the Union Pacific Railroad Company.

Table No. 1 is deduced from statements of operating expenses for the four years ending June 30th, 1902, and shows the percentage that each item of the table bears to the whole. The average cost per train mile is also shown, and this cost is divided between the items of the table according to the percentages shown.

Before proceeding to consider the value of gradients, distance, etc., it is necessary to obtain some basis for arriving at the proportional percentages of the more important items that are affected by changes in location. In many of the smaller items judgment alone has to be used, and in most of such cases a wide variation in judgment will produce but a slight change in the final figures. In the larger items of Maintenance of Way, Maintenance of Equipment and Conducting Transportation, the reports of the various departments for the four years covered by Table No. 1 have been studied and the conditions as they exist on the Union Pacific have been considered. The reasons for adopting these percentages are given in detail in Wellingtons' "Economic Theory of Railway Location." Tables Nos. 2, 3, and 4, together with the following notes, give some additional reasons and also explain those points wherein percentages different from Wellington's have been used."

Now after hearing that statement Mr. Berry made as to how he arrived at the percentages given in his Table No. 3, you find you are mistaken in assuming that he merely adopted the Wellington percentages, do you not?

A. Well, I don't know. I simply took it for what it 4086 reads.

He speaks specifically there of applying Wellington's methods. I did not know what Wellington's method was for making his table.

The manner of arriving at the expense of maintenance of an article, surely the percentages of the various parts would be changed at the time the entire article is changed in all its details.

Q. But Mr. Berry says he has made up his table No. 3 from the result of four years operation on the Union Pacific Railroad.

A. That may be. I do not know what the details of his operation were; and I do not know whether they are these individual items. (Indicating table). He says "in individual cases they are matters of judgment."

Q. He said when they are slight, but in large items like equipment, he has taken four years experience?

A. In speaking of maintenance of equipment he speaks of it as a whole. How they divide maintenance of equipment I do not know. So far as taking it from Wellington's, it looks to me they are nearly alike, he has 20% and Wellington has 21.5%, for starting and stopping.

Q. I wish to call attention to the fact that he says he has used Professor Webb's method of classification which is adopted by the Interstate Commerce Commission items for maintenance of work and other equipment.

4087 A. I do not know whether these items are according to the Interstate Commerce Commission classification, and I am not familiar with Mr. Webb's work.

Q. At any rate, you see Mr. Berry's table No. 3 is made up from four years statistics on the Union Pacific as to these particular items, do you not?

A. Yes, sir.

Mr. HILL: I wish to introduce this table No. 3 in full here.

The paper referred to is in the words and figures following to-wit:

| Class of service. | Total cost, percent. | Distribution of contributing causes, in percent. | | |
|---|---|---|---|---|
| | | Time and exposure. | Stopping and starting. | Switching. |
| Passenger | 100 | 11 | 20 | 11 |
| Freight and work | 100 | 6 | 20 | 16 |

| Class of service. | Curvature. | Grades. | Distance. |
|---|---|---|---|
| Passenger | 2 | 20 | 36 |
| Freight and work | 2 | 20 | 36 |

4088 Mr. HILL:

Q. Mr. Rosing, this shows that this report was made in 1904, and applying four years work there he gives the years shortly before that time, during that period, and working out practically the same result that Mr. Wellington made some ten or fifteen years earlier—wouldn't it indicate that the Wellington proportions were practically right as applied to modern railroad management?

A. No, sir, I don't think so. I think the percentages given here are just as authentic, so to speak, as the ones in that report.

Q. You are basing that upon the judgment of yourself and your associates, and these authors have based theirs upon many years' experiments and tests.

A. Our observations are of course from experiments and from actual work done. We repair cars daily all the year around, and a great many a day on the system—in the neighborhood of 3,000 cars a day. And in associating with the men who do this work, and from my personal observation, and in connection with the designing and construction of new equipment, in which we always take into consideration the service of the old equipment, is what I base my figures on.

Q. That is your opinion based upon your experience?

A. Yes, sir.

Q. And you do not agree with these two gentlemen who have made these experiments and tests over many years' work?

A. Well, mine has been over many years of work.

4089 Q. Another case of "Doctors disagreeing."

A. Perhaps so.

Q. You explained at some length yesterday that the improvements in automatic air brakes, and trucks, and various things of that kind,

had in your judgment, increased the expense of starting and stopping trains, for the reasons which you gave: isn't it also a fact that the resisting power to stand the trains have likewise improved?

A. Yes, sir.

Q. If the resisting power had not been improved, and in a measure kept pace with the other, your line would be strewn with wrecks from one end to the other, would it not?

A. I do not think so. Of course, that resisting power refers only to new cars of modern construction. There are a great many old cars in service and probably will be for a great many years, which we are obliged to operate in connection with the newer and heavier equipment. Of course, their structural parts are not as well prepared for resisting the handling as that of the newer equipment.

Q. Yesterday Mr. Moore asked you if you thought the division of car repairs on passenger trains between coach, mail and express on a car mileage basis was fair and you said you thought it was not: that is correct, is it not?

A. Yes. I do not remember saying "The division of car repairs." I thought it was a division of locomotive expense on car mileage.

4090 Q. The testimony reads:

"The state, in Exhibit M filed in this case, has divided the expense of car repairs on passenger train cars between coach, mail and express service, upon a car mileage basis: is that a fair method of division? and you say:

"No, sir."

A. No, sir.

Q. You maintain that position, do you, that it is not a fair division?

A. Yes, sir.

Q. Now is it a fair division to apportion the expense of these items between states on a car mileage basis?

A. No, sir, it should be apportioned in accordance with the work done on the different classes of cars?

One kind of car may need two or three times the work because it has two or three times the parts on it which to work with. While the other cars do not have those parts at all.

Q. You are speaking of locomotives, now?

A. No, sir, of cars. The difference between an express car and a Pullman car and between a Pullman and a coach.

Q. You do not repair Pullman cars, do you?

A. No, sir, but I am showing the difference between the construction of the different kinds of cars. Take a chair car or a dining car and cars of that character. They are entirely different kinds of cars.

4091 Q. On the Missouri Pacific System are not all the cars put into a pool and their repairs divided on a car mileage basis?

A. I do not know how they handle those accounts.

Q. Would not that be a fair way of dividing it?

A. The percentage of total expense divided among the different classes of cars on their mileage basis?

Q. Yes.

A. I do not think that would be fair.

Q. You do not think that would be fair?

A. No, sir, I do not.

Q. Bring that down to this point: Arkansas, of course, obtains a part of the mileage of the St. Louis, Iron Mountain & Southern and the Missouri Pacific Systems: would it be fair to divide the expense of maintenance of equipment, of cars that were apportioned to Arkansas, on a car mileage basis, arrived at by taking the whole pool of the Missouri Pacific System, taking all of them together?

A. I do not see how you can divide the total expense on a car mileage basis, when the work on the different classes of cars varies. That is, cars moving varying distances, costing various amounts to do that work.

Q. I wish to read you statement 5 of Exhibit 3 filed in this case, which explains one method of apportioning the expenses: it reads as follows:

"Maintenance of equipment. This account includes
4092 all kinds of repairs, renewals, depreciation of cars and locomotives; also shop machinery and tools. The cost of repairs, renewals and depreciation of equipment being of a general nature and not applicable to any particular state is divided among all states upon the basis of the mileage in each state of each class of service."

I will ask you if that is a fair division of that item of expense?

A. It does not seem to me it should be divided on a mileage basis. It may be relatively the correct or the most convenient way for obtaining figures, or something of that sort.

Q. The same thing would be true, if it is true——

A. (continued). I do not see how you can take the different cars making the same mileage, and apportion the total expense of those cars equally on a mileage basis, when the different cars require different amounts to repair them, in making the same mileage.

Q. Your objection to this point would go, if I understand you, as well to a division between states as it would to a division between the classes of service?

A. There is only the passenger service. There is no difference in the classes of service; it is all passenger service. You said "different classes of service."

Q. I did not state my question properly. I meant the different cars—I mean coaches, mail and express cars.

A. You mean "classes of equipment"?

Q. Yes, that is the word I should have used—equipment.
4093 As I understand you, your objection would go equally to dividing it between states on this basis as to dividing it between different classes of equipment: you do not think that is a proper factor in either instance, do you?

A. No, sir, I do not.

Q. Speaking of units for dividing expenses of the cost of maintenance of track, it is usually reduced to the cost per mile, is it not?

A. I am not at all familiar with the track part of it.

Q. Is not the cost of the locomotives measured by the cost per mile run of the locomotives?

A. That is frequently done that way as a matter of comparison.

Q. But you do not regard it as a good method?

A. That is one that has been generally adopted, but it is not correct. It does not give the engine any credit for the work it does.

Q. You know Mr. M. L. Byers, do you not?

A. Yes, sir.

Q. What position does he occupy on your railroad?

A. Chief Engineer Maintenance of Way.

Q. You regard him as a typical man in his work?

A. Yes, sir.

Q. Are you familiar with a book he has written called "Economics of Railroad Operation"?

4094 A. No, sir.

Q. You know he is the author of that work?

A. Yes, sir, I know he is the author of that work.

Q. I wish to read you from page 97 of that work and see if it agrees with your ideas on that subject:

"The common measure of track is the foot or mile, and, in comparing the cost on different territories, the cost of maintenance of track is usually reduced to the cost per mile. The cost of maintenance of locomotives however, is measured, not by the cost per mile of locomotive, but by the cost per mile run, so that, if we should combine the cost of locomotive repairs with the cost of track repairs, we would be unable to apply any unit of measure which would be reasonable for the entire expense."

Do you agree with his statement in there as to the proper unit for dividing those two items?

A. I never thought of that (examining book). What he means there is that you have not a locomotive a mile long to compare with a track a mile long. I do not see that one has any relation to the other.

Q. He points that out. He is right, isn't he?

A. I do not see that that has anything to do with it. That is merely a statement of facts that there are two individual things to be compared.

Q. The point I am calling your attention to is that in developing that point Mr. Byers states that the locomotive mile is the proper measure of expense of equipment of the locomotive, and I ask you if you agree to that proposition?

A. There are no repairs to a locomotive standing still. The engine must move to cause repairs, and in moving it makes
4095 mileage. That is one basis. But that is only one part of the duty of the locomotive and it is a convenient measure for dividing up expenses.

I do not know the origin of that but I know it has been going on many years, while I have been railroading.

But there are many improved methods of measuring the operation of the locomotive and the work done, than by the ton mile basis.

Q. You think that is more efficient?

A. That is the only way. You can only gauge the work a man

does in a given time. And you can only measure the work the locomotive does in a given time.

Q. How would you measure it?

A. On the ton mile basis.

Q. You approve that?

A. Yes, sir. That entails a great deal of work and it is doubtful if that refinement of measuring the operation of the locomotive is of sufficient value to pay for the expense of maintaining it.

Q. This would be gross?

A. Either gross or net. The two go together. You cannot have one without the other.

Q. You think the ton mile is an efficient measure of expense?

A. Yes, sir.

Q. A great many of these doctors learned in railroading have been trying to educate me to believe that was not the case:
4096 they have not educated you to believe it, have they?

A. Maybe I am a poor doctor. I know I advocated it a great many years ago, when I was first engaged in engineering statistics.

Q. Has your experience strengthened your views on the subject?

A. It has not changed them any.

Q. I believe you stated that in your judgment the car mile is not a proper factor for dividing the expenses between mail, express and passenger coaches? I believe you said that was not proper: is that correct?

A. Yes, sir.

Q. Do you know S. C. Johnson, the General Auditor of the Cotton Belt?

A. No, sir.

Q. Do you know him by reputation?

A. I do not know that I have ever met him.

Q. I understand he is a very expert accountant and that he has been Auditor of the Cotton Belt Railroad a great many years. I have not the pleasure of his personal acquaintance but I understand he is very expert?

A. I grant that.

Q. I wish to read you a statement he submitted to a committee of Congress which is published in a volume entitled "Railway mail pay, testimony taken by the Commission to investigate the postal service," part two, at page 563.

He says: "I submit herewith a few facts relating to the railway mail service on this line, which will show why the compensation for such service should not be reduced."

4097 Then he gives a table of receipts from the various mail routes on the Cotton Belt road, which I will omit.

Then he gives the expenses for the year, which I will also omit.

Then he says:

"The proportion of operating expenses and fixed charges chargeable to mail traffic given above are arrived at on a car mileage basis as follows".

Then he takes up the actual figures, which I will omit reading unless you wish to hear them, to show how he gets his percentage, and in giving those figures he says:

"The basis used in arriving at the expenses chargeable to mail traffic seems to be an equitable one, and if any criticism could be offered against it it would be that the proportion allotted to mail traffic is too small, because the mail cars are more expensive than the ordinary passenger cars, and the apartments of the mail and express cars allotted to mail service are fitted up with racks, cases, etc., while the express apartments are simply left bare."

What do you think of that statement of Mr. Johnson?

A. That depends. On the ordinary passenger cars, if he repairs the coaches I should say that the coach costs more than the mail car. A chair car will cost more than a mail car: and an express car will cost less than a mail car.

Q. He just gives that as one of his reasons. What he says is "the car mileage is an equitable basis to apportion the operating expenses between coaches, mail and express cars".

I am asking you if you agree with Mr. Johnson's views as to that?

4098 A. It simply reverts back to the question of the mileage basis. It seems to me a more equitable way would be——

Mr. MOORE: Before that question is answered I want the witness to understand and I want to understand just exactly what Mr. Johnson is testifying or talking about.

Mr. HILL: I will read the statement from the book.

Counsel here reads.

Q. The whole question is divided on a car mileage basis and I ask you if you agree with Mr. Johnson's statement that that is an equitable way of dividing the expense?

A. Between the different classes of cars?

Q. Yes.

A. No, sir, I do not think so. I will make an illustration of what I am trying to tell you. What I am trying to get at is this: suppose you have an express car in a train and a coach in a train and they go one mile. At the end of the mile the work required on the express car costs $1.00 and that on the coach costs $5.00. Then the two cars together to go two miles would cost $6.00 and I do not think it would be fair to say that because they went one mile each of the cars should be charged up with $3.00 a piece.

Q. Do you know Mr. Stewart R. Knott?

A. No, sir.

Q. Formerly Vice-President of the Louisville & Nashville Railroad and recently president of the Kansas City Southern Railroad?

4099 A. No, sir.

Q. You know him by reputation, do you not?

A. I know he is a railroad officer and that is all.

Q. I want to call your attention to a statement from him made

in this same hearing, which is found on page 604 of the same volume I have just quoted from. It is as follows:

"The operating expenses, as divided between "passenger" and "mails" are arrived at by taking the total operating expenses chargeable against "passenger train earnings" and dividing same on the basis of car mileage. The "passenger expenses" were charged with the total mileage of all coaches, parlor and sleeping cars, together with the total mileage of all baggage cars and one third of the mileage of "combination" baggage, mail and express cars". The "expenses of conducting mail" were arrived at in like manner by charging to that account the total mileage of the railway post-office cars and one-third of the mileage of the "combination" baggage, postal and express cars. This is clearly not an unfair basis of division, so far as the transportation of mail is concerned, when we bear in mind that the postal cars are more expensive both to construct and maintain and to operate than the ordinary baggage or express cars; and same is true with regard to the postal apartment in the combination baggage, mail, and express cars—i. e., such apartments are provided with special facilities for the handling of mails not provided or required in the express or baggage apartments."

A. I say that is just right.

Q. You agree with that?

A. Yes, sir. That speaks of a coach and mail car as compared with an express car.

Furthermore, all those mail car statistics you have read on a mileage basis I say would be nearly correct so far as it relates to a coach, because a mail car will weigh nearly as much as a coach.

4100 Q. He speaks of it as a comparison,——

A. His last remark you read referred to comparison of a mail car and an express car.

Q. He thinks it is fair.

A. What you read now is correct, but that is different from the other question.

Q. Mr. Knott answered a question from Senator Allison, during this same hearing, and which appears at page 599 of this same book. It reads as follows:

"Senator ALLISON: Do you regard that as a fair basis of approximate cost and approximate earnings?

Mr. KNOTT: I do not, sir. I think a committee of expert would find that that is a partial statement in favor of the Government's side of the question, because we have assumed that the transportation of the mail is handled only with the same expense and under the same conditions as the transportation of our freight and passengers, and that is not the case."

Do you agree with that, that the transportation of the mail is more expensive than the transportation of freight and passenger?

A. I don't know about that.

Q. You spoke of cleaning cars, as if that were a maintenance of

equipment expense: that expense does not belong to the maintenance of equipment in the classification of accounts, does it?

A. I am not familiar with the details of distribution.

Q. You are not familiar with the method of classifying the various accounts?

A. No, sir, I do not follow that.

Mr. MOORE:

Q. That class of expense, yard and train expense, is an
4101 expense incurred by the mechancial department?

A. What expense?

Q. Expense of cleaning cars.

A. We handle the work of cleaning the cars almost exclusively.

Mr. HILL:

Q. Mr. Rosing, I see that this item 63 on exhibit 3 "passenger cars, cleaning of", which I understand is a cleaning proposition, shows that $50,600.32 is charged to Arkansas on that account out of a total expense charged to Arkansas of $4,931,224.75.

If there are any errors in distributing that cost on a car mileage basis, the total cost is fifty thousand out of nearly five million: whatever error that would be, would be a negligible quantity on the total results, wouldn't it?

A. I don't know. It would be whatever the figures will show. I would not be the one to determine whether it is negligible or not.

Redirect examination.

By Mr. MOORE:

Q. Mr. Rosing, the yard and train expenses are set out in Exhibit M, to which reference has been made in your examination, amounting to $549,069.

The expense of the car- of passenger cars is $50,600 or about 10% of the total of yard and train expense; that is, on ten percent of the items divided on that basis we have been making that division.

4102 A. Yes, sir.

Q. I want to know if that 10% out of an item that amounts to over half a million dollars would not make some difference in the result?

A. Yes, sir.

Q. Counsel called your attention to the fact that there were some four million dollars of total expenses involved in operation during the period mentioned. That includes freight and passenger. The passenger end of that amounts to $1,678,000. Nearly one-third of that, that is something over half a million dollars, is involved in the yard and train expense, and 10% of that is involved in this cleaning.

That expresses, if my figures are correct, and they are taken from the exhibits in this case, the important or lack of importance of this item of car cleaning?

A. I should say so.

Q. Your attention was called to your statement that the expense of car repairs on passenger train cars should not properly be divided on a car mileage basis: you were asked why that was not true and you said because it costs twice as much to repair a coach in one class of cars than in another class of cars: it was because of the want of quality in the labor and expense between the different classes of cars engaged in that service, was it not, that caused you to say it could not be divided on a car mileage basis?

A. Yes, sir, the different classes of cars making the same mileage.

4103 Q. If you were going to divide this between the same classes of cars, a different rule would prevail, would it not?

A. Yes, sir.

Q. The Missouri Pacific System, of which the St. Louis Iron Mountain & Southern is a part, operates in more than one state, operated in Missouri and Arkansas?

A. Yes, sir.

Q. The Iron Mountain is a part of the Missouri Pacific System, which embraces more than one state, in dividing the expense of the several branches of service, including maintenance of equipment, and ascertaining that which belongs to any one of the states in which the system is operated, it is necessary to make an apportionment or division between the states in which the property is operated? Is there any other basis than the mileage upon which a division between states of the expense of the various kinds of service can be made, than an apportionment with reference to the mileage in each territory: is there any other way to make it?

A. I think the mileage would be the only basis on which you could divide that, because there would be just as much variation in the different kinds of trains in one state as in another, on an average, during a month or a year or whatever period you wanted to arrive at.

Q. When you come to divide this car expense we will say we are treating of now, keeping the passenger cars in repair, for the

4104 purpose of ascertaining correctly or as closely as is possible to obtain it correctly, you have already said you could not take the total mileage of all the different classes of cars, mail, baggage, express, coaches, and divide it by the car miles. In that case what would be the proper method of making a division of the cost between these different class- of cars?

A. That would be very difficult to do, I should judge. I would have to take the actual cost for each different car, and the mileage that each separate car made during a given time.

Q. In other words, you would have to ascertain the expense of each class of car used and divide that between the members of that class, on a mileage basis?

A. Yes, sir.

Q. That would attain as near perfection as is possible?

A. You would have to get the expense of each individual car and the mileage of that car.

Q. What I mean is this: If you wanted to divide it on a mileage

basis you would approach approximate correctness by confining your division to the various classes of cars?

A. Yes, sir.

Q. That is to say, coaches, mail and express cars and so on?

A. Yes, sir.

Q. But when you come to group them and take the total cost of all classes of cars, and then divide it on the mileage basis,

4105 you are just as far wrong as the difference that exists in the cost of repairing each class of cars, are you not?

A. Yes, sir.

Q. If it costs twice as much to repair one class of car as another you would be just as far off from being correct in dividing on that basis?

A. Yes, sir.

Q. That is what you meant by your statement that the car mileage was not the proper basis for division, is it?

A. Yes, sir.

Q. Your attention was called to the work of Mr. Byers, who testified in this case yesterday, on economics of railroad operation and particularly to page 97 of that book where in discussing the subdivision of expenses he states some principles to which your attention was called:

Mr. Byers says:

"It is important that two points be kept in mind:

First, that the subject of expenses have a common unit of measure.

Second, that the expenditure be brought about by similar causes."

And the reason you have just given that the basis of apportionment adopted by the state in this case, as to the expenditures we have been talking about is wrong, is because of those two principles, is it not?

4106 In other words, is there a common unit of measure as between actual expense of keeping coaches and express cars in repair, or is there a different unit or measure of cost applicable to each one?

A. You might apply the same unit of cost, but the cost per unit would vary greatly.

Q. He says "the expenditures must be brought about by similar causes."

Isn't it also essential that there should be a measure of quality in that expenditure as between the two classes which you propose to divide in common, in order to make that division proper?

A. I should say yes.

Q. What do you understand in its application to this division of the cost of repairs to passenger cars to be the unit of measure? Or what is your understand- is the unit of measure?

A. You must have a unit of measure.

Q. You mean that is your view?

A. That is my view.

Q. Does that unit of measure exist as between the different classes of vehicles? Is it a common unit by which you can measure the ex-

pense incident to a coach and the expense incident to an express car?

A. I say, you must have a unit of measure for the car. Now, the cost per mile to run them is on a mileage basis. But you cannot take the sum of those two and divide by the mileage and
4107 get the relative cost. That cannot be done. It may be done for convenience, but it is not a fact in the case.

Q. There is a difference between getting a unit of cost to compare with as between two territories and two periods of time, and getting that cost actually in dollars and cents for the purpose of dividing between the two branches of the service.

A. I do not understand that.

Q. I will read you what Mr. Byers says:

"The common measure of work is the foot or mile and in comparing the cost on different territories"

that is what I am calling your attention to, different states—

"in comparing the cost on different territories the cost of maintenance of track is usually reduced to the cost per mile."

Why is that done and why is it done that way?

A. Because that is the actual amount of money spent on that mile of track.

Q. Why do you do that? I understand when you apply that to one mile, but when you apply it for the purpose of comparison to ten miles for the purpose of ascertaining relatively the cost, say in Arkansas and Missouri, why do you adopt that measure then?

A. I would not say to take the total cost and divide it by mileage in two states would be the relative cost, because there might be twice as much mileage in one as in the other. Take the mileage of
4108 a baggage car here and in another place. The mileage of track in one state and in another state would be just the same on the two cars in the same state, but it would not be the same in comparing a baggage car and a coach. That would be a different thing. But a mile of track and a mile of track is the same thing.

Q. But your attention was called to a statement made by Mr. S. C. Johnson in a hearing by the Mail Department at Washington in connection with the Postal Cars on his road, in which he is quoted as saying that mail cars are more expensive than ordinary passenger cars to keep in repair.

Do you think he is correct in that statement?

A. I don't know what he means by "ordinary passenger cars." That is very indefinite, indeed.

Q. His language is:

"The mail cars are more expensive than the ordinary passenger cars, and the apartments of the mail and express cars allotted to mail service are fitted up with racks, cases, etc., while the express apartments are simply left bare."

A. You see there he refers simply to express cars. The ordinary passenger cars against the ordinary express cars and all the cars that ordinarily make up a passenger train. He is correct so far as express cars are concerned but not coaches. He also apportions them on passenger trains.

Q. Your attention on cross examination was called to a statement made by Mr. Knott before the Congressional Committee that the mail was not transported at the same expense as freight and passenger but at a higher expense:

4109 I ask you if you agreed to that and you said you did not. I want to call your attention to the entire statement made by Mr. Knott.

Mr. Knott did not put his statement that the mail service was more expensive because the care of mail cars was higher than the cost of the care of passenger cars, but here is what he says:

"The government has the right, and exercises it, of designating on what trains the mail shall be carried.

It is frequently the case that we schedule a passenger train at a certain rate between terminal points to carry a certain number of cars. Assuming that it is a fast train to which we are referring, the Government begins to add mail on to that train and take it off of other trains—the slow trains. The first thing we know, having scheduled that train up to its maximum of speed with the number of cars assigned to the engine, the Government comes and says, "The mail on that train is so heavy that we will require an additional postal car," and it will order, without any further question on our part, that that train, although scheduled, we will say, for five cars at a maximum of speed, shall carry the additional postal car."

Then he goes on to show that as the preference is that will perhaps result in an entire rearrangement of the whole passenger schedule for that division. Then he says:

"The result is not infrequent, therefore, that the placing of that additional car upon a train already scheduled will require an entire rearrangement of the passenger train schedules for that division, either by changing the time of arrival and departure of the train, slowing it down so as to carry the additional car, or, as is sometimes the case, actually putting on an additional train in order that the original train may continue to carry the excess Government mail matter at the original schedule rate. Now, those are incidents arising in the business to which we have given no consideration in the analysis to which I have heretofore referred."

4110 That is a very different proposition from the relative expense of maintaining a coach and a mail car, is it not?

A. Why, yes, quite so. You might have to buy a new locomotive to do it.

Q. Your attention was also called to a statement of Mr. Knott at page 604 of the report from which counsel read: Mr. Knott said here, making this comparison—he first says:

"The operating expenses, as divided between "passenger" and "mails," are arrived at by taking the total operating expenses chargeable against "passenger train earnings" and dividing same on the basis of car mileage. The "passenger expenses" were charged with the total mileage of all coaches, parlor and sleeping cars, together with the total mileage of all baggage cars and one-third of the mileage of "combination" baggage, mail and express cars. The "expenses of conducting mail" were arrived at in like manner by charg-

ing to that account the total mileage of the railway post-office cars and one-third of the mileage of the "combination" baggage, postal and express cars. This is clearly not an unfair basis of division, so far as the transportation of mail is concerned, when we bear in mind that the postal cars are more expensive both to construct and maintain and to operate than the ordinary baggage or express cars."

Don't you say the same thing?

A. Yes, sir, and further that the mail car is heavier.

Q. You were asked on cross examination if this was the first time in all your experience that you had ever attempted to locate the expense of car repairs: do you mean to say you had never given any attention to that subject for the purpose of ascertaining the relative parts of a car—what it would cost to keep the rela-

4111 tive parts of a car in repair?

A. I think I said it was the first time I had ever tried to divide it on a percentage basis in comparison with Mr. Wellington's tables. So far as the relative repairs to cars or engines is concerned, that is a matter of daily consideration, study and observation.

Q. It has been a matter of study with you for years?

A. Always. That is my business.

Q. Mr. Berry, who is referred to by counsel, is a civil engineer, is he not?

A. Yes, sir.

Q. He is not engaged in the same line of work that you are engaged in, mechanical engineering?

A. Not that I know of.

Q. And he was chief engineer of the Union Pacific Railway?

A. Yes, sir.

Q. Would his duties bring him into contact with and give him the experience you have had as a mechanical engineer, in acquiring information as to the cost of keeping machinery in proper order?

A. I do not think so.

Q. Basing his judgment upon the information he would acquire in actual experience in the position he holds as chief engineer, as compared with the man on his road who is engineer of the

4112 Mechanical Department, which would be able to form the better judgment as to the cost of repairs in any particular branch of the service, say the maintenance of a locomotive or maintenance of a car?

A. I should say the engineer of the Mechanical Department. I would think Mr. Berry would get his figures from the Mechanical Department.

Q. I want to call your attention to a table which contains a classification of the expenses used in preparing the formula in statement No. 3 at page 695 of this volume: That formula which seems to be a formula for the distribution of contributing causes of expense, gives the total cost, etc.: I want you to look at that table under Maintenance of Equipment and see if there is any division there or any item by which the expense of starting and stopping freight cars

can be ascertained and separated, or which would be of any service in the preparation of the formula for apportioning that class of expense?

A. You mean if there is any basis here for arriving at the distribution shown in that table?

Q. That is the classification of expense which is used in the formula on the table shown on the preceding page: Is there anything that would afford the means of dividing the cost of starting and stopping freight trains?

A. No, sir.

Q. That table gives the percent that each item contained in it is of the total expense: but it does not give, or purport to
4113 give, does it, any information which would enable one to determine the relation of the different items of expense in the different classes?

A. No, sir.

Q. Under "Maintenance of Equipment" is "Superintendents" "Repairs and renewals" "locomotive and passenger freight cars," and so on. That means the total expenditure in connection with freight cars; repairs and renewals is 5.32% of the total cost of maintenance of equipment. But that does not undertake to divide that 5.32% between the different kinds of service and repairs that are necessary to keep freight cars up?

A. No, sir.

Q. That is the point to which I wish to call your attention.

A. It does not.

Q. This engineer is discussing the effect that the proper location of the line of railroad will have upon operating expenses. He says in the beginning of his treatment of the subject in which these tables are embraced:

"In order to intelligently locate a line for a railroad, it is essential that a study be made to determine what effect the location and construction cost of different routes would have on the operating expenses and fixed charges of the road."

In discussing that subject he is dealing with a matter that comes within his profession, is he not, the location and construction of a railroad?

A. Yes, sir.

4114 Q. And there is no man so competent to deal with that subject as a civil engineer, is there?

A. I do not think there is.

Q. In outlining his purpose with reference to the relation between the location of the road and operating expenses he says:

"The details of location affecting operating expenses are Gradients, Distance, Curvature and Rise and Fall."

Then he says:

"As the effect of these details on operating expenses varies most directly with the number of trains operated, the "train mile" is used as the general operating unit."

A. Yes, sir.

Q. Then he says:

"In order to determine the relative merits of different locations, values must be ascertained for each detail affecting operating expenses."

Now it is for that purpose he is making this division of these expenses and when he comes to divide it he says:

"In order to obtain a value of these details of location for the use of engineers in the Western states, the general methods of both Mr. Wellington and Prof. Webb are applied in this paper to the operating expenses of the Union Pacific Railroad Company."

He does not say what his opinion is as to the merit or demerit of Mr. Wellington's plan, but he simply adopts it. I presume he thinks it is all right. But there is nothing there to indicate, is there, that he has made any investigation of it or that he is
4115 familiar with that division? Do you see anything there that would indicate that?

A. No, sir.

Q. He is trying to apply the best knowledge he can obtain from other sources—that is, from authorities that deal with other matters with which he is not familiar to the proper location of railroads, for the purpose of determining and demonstrating the relation between location and operating expenses. But do you understand from reading that, that this engineer had made any investigation of the merits of the methods of division and details of expense at all?

A. I do not think he did. I do not think he says he did. He just used this formula, as they call it, of Mr. Wellington.

Q. It is a "ready made suit" he bought for himself.

A. Yes, sir, and at that time it may have answered his purpose. But when you are dealing with cars today the cars that were not in existence when the table was made cars of different type, cars used for different purpose, that were not known in those days, then this whole table changes.

Q. Do you understand from this, that this engineer's discussion involves any consideration of correctness or incorrectness of Mr. Wellington's rule?

A. No, sir, I do not see that it does there.

Q. Then follows a table No. 1, to which I will call your attention, in which he enumerates the per cent of the various items of maintenance of equipment; and then on page 695 is table
4116 No. 3, wherein he applies Mr. Wellington's formula for the purpose of ascertaining the cost of starting and stopping trains. He practically follows Mr. Wellington in that. That is all there is to Mr. Berry's report.

A. I would say if he follows Mr. Wellington's formula he would probably get the same relative answer as was given in Mr. Wellington's table.

Q. In referring to this report to the Maintenance of Way Association yesterday, you counted upon the division of expense for starting and stopping trains that applies to passenger cars, which is the same?

A. Yes, sir.

Q. You said "It certainly cost a little more to repair the draft rigging on a freight car relatively than on a passenger car?"

A. Yes, sir.

Q. You did not explain, although I intended to ask you about it, why it costs less on a passenger car than on a freight car?

A. The manner of coupling passenger cars together relieves a great deal of the shock in starting and stopping the train, by reason of the buffing attachment. This attachment is not applied to freight cars.

Furthermore, the starting and stopping of passenger trains is usually performed with from three to six or eight cars while with freight trains it may run up as high as 50 or more cars.

4117 The amount of effort required to operate the drawbar to start a passenger train is much less than that on a freight train, on account of the increased weight of the freight train.

Therefore, the strain on the two classes of equipment is very different, being very much less on the passenger train. And the actual performance of work in freight and passenger yards would demonstrate that the repairs to freight cars on starting and stopping far exceeds that on passenger cars.

Q. In the table prepared by Mr. Berry in the report which has been referred to in connection with him, in making his distribution of cost of car repairs he charges the same per cent, 20 per cent, to passenger and freight cars. There is nothing in the book that indicates why he did it or that he had any reason for it.

I want to ask you if in the absence of any explanation which does not appear that he simply followed Mr. Wellington's form and applied it to passenger and freight cars alike, without regarding the distances to which you have called attention, in the difference in cost?

A. That may be the case. Mr. Wellington does not refer to any passenger car repairs at all.

Q. He did make a different application of the expenses in some other matters—that is, time and exposure of passenger and freight cars.

4118 A. I beg your pardon. I would like to ask Mr. Johnson a question.

Mr. Johnson is that what we call "depreciation?"

Mr. JOHNSON: No, sir, that is an entirely different item from depreciation as we understand it now.

Recross-examination.

By Mr. HILL:

Q. Mr. Wellington's formula did not work up any passenger statistics, did it?

A. No, sir.

Q. Then Mr. Berry was not following Mr. Wellington on his passenger statistics?

A. I don't know anything about what Mr. Berry was doing.

Q. You don't know anything about Mr. Berry's article except what appears on the face of it, as read here this morning?

A. No, sir.

Q. I suggest then that instead of making comments on it the three pages referred to be copied into the record.

The paper referred to is in the words and figures following, to-wit:

4119 *Economic Basis of Revision Work.*

In order to intelligently locate a line for a railroad, it is essential that a study be made to determine what effect the location and construction cost of different routes would have on the operating expenses and fixed charges of the road. Any expenditure in construction which reduces operating expenses by an amount greater than the interest charges on such expenditure will be an economy. The volume of traffic being equal, the most economical location is that which will require the least expenditure to cover the combined cost of interest and operating expenses.

The details of location affecting operating expenses are Gradients, Distance, Curvature and Rise and Fall. As the effect of these details on operating expenses varies most directly with the number of trains operated, the "train mile" is used as the general operating unit.

In order to determine the relative merits of different locations, values must be ascertained for each detail affecting operating expenses. "The Economic Theory of Railway Location" by Mr. A. M. Wellington, treats the entire subject fully. In this work Mr. Wellington has given to engineers a logical method of obtaining the values for distance, curvature, rise and fall and gradients, but the modern classification of operating expenses as adopted by the Interstate Commerce Commission gives these expenses in greater detail than could be obtained during the life of Mr. Wellington. This detail is of material assistance in following out Mr. Wellington's general method, as it lessens the chance for error in judgment as to the proportion of each item of expenses which will be affected by changes in the details of location.

Prof. W. L. Webb, in his recent work on "Railroad Construction" has developed values for the various details, following the general method given by Mr. Wellington, but using the classification and figures given in the Reports of the Interstate Commerce Commission for the entire railway system of the United States. A study of these reports shows that the average cost per train mile in the more populous states is less than in the states west of the Missouri River.

In order to obtain a value of these details of location for the use of engineers in the Western states, the general methods of both Mr. Wellington and Prof. Webb are applied in this paper to the operating expenses of the Union Pacific Railroad Company.

Table No. 1 is deduced from statements of operating expenses for the four years ending June 30th, 1902, and shows the percentage that each item of the table bears to the whole. The average cost

per train mile is also shown, and this cost is divided between the items of the table according to the percentages shown.

4120 Before proceeding to consider the value of gradients, distance, etc., it is necessary to obtain some basis for arriving at the proportional percentages of the more important items that are affected by changes in location. In many of the smaller items judgment alone has to be used, and in most of such cases a wide variation in judgment will produce but a slight change in the final figures. In the larger items of Maintenance of Way, Maintenance of Equipment and Conducting Transportation, the reports of the various departments for the four years covered by Table No. 1 have been studied and the conditions as they exist on the Union Pacific have been considered. The reasons for adopting these percentages are given in detail in Wellington's "Economic Theory of Railway Location." Tables Nos. 2, 3, and 4, together with the following notes, give some additional reasons, and also explain those points wherein percentages different from Wellington's have been used.

Maintenance of Way.—Total side track mileage is about 34 per cent of mileage of main track. One-half of side track mileage is in large yards and terminals, the balance being side tracks at intermediate stations. There is probably about one-third as much labor spent on repairs of side tracks as on the same length of main track. The same is assumed to be true of material; hence, in these calculations it will be assumed that labor and material in repairs of roadbed and track are distributed as follows:

| | |
|---|---|
| Main track | 90 per cent. |
| Large yards and terminals | 5 per cent. |
| Smaller stations | 5 per cent. |
| Total | 100 per cent. |

Maintenance of Equipment.—From the annual locomotive performance sheets and statistics of train service it is found that total train mileage is but 75% of total locomotive mileage. Table No. 2 is similar to a table given by Wellington, the total cost of locomotive repairs being prorated between the different classes of service according to mileage. The distribution with reference to contributing causes is changed somewhat to fit the conditions on the Union Pacific, curvature on the Union Pacific averaging 17 degrees per mile, whereas Wellington assumed 30 degrees per mile.

Conducting Transportation.—As only 75 per cent of engine mileage enters into total train mileage, the wages of engine and roundhouse men due directly to hauling trains with single engine are assumed as 75 per cent of the whole.

In train service only about 75 per cent of the crews are paid on a mileage basis, the balance being on monthly wages, and any increase of distance, unless it be great, would affect only 75 per cent of this item.

4121 Fuel, water, oil and waste are covered by Table No. 4.

General Explanation.—It must be thoroughly understood

that the total train mileage includes the mileage of all passenger, freight, work and special trains, whether revenue or non-revenue. In the calculations as to the effect of the various details of location on operating expenses a single train is considered with a single locomotive. Therefore, none of the expense connected with helper, switch or light engine enters into the calculation, and only that proportion of the remainder of each item of operating expenses which is affected by gradient, distance, curvature, etc., is considered.

4122 TABLE NUMBER ONE.

*Statement Showing the Average Proportion That Each Item of Operating Expenses Bears to the Whole on Union Pacific Railroad for the Four Years Ending June 30, 1902.*

| Item No. | Item. | Per cent of whole. |
|---|---|---|
| | Maintenance of Way and Structures: | |
| 1. | Ballast | 0.28 |
| 2. | Frogs and Switches | 0.35 |
| 3. | Protection of River Banks | 0.03 |
| 4. | Repairs of Roadbed and Track | 8.33 |
| 5. | Repairs of Snow Fences and Sheds | 0.10 |
| 6. | Spikes and Rail Fastenings | 0.86 |
| 7. | Superintendence | 0.55 |
| 8. | Renewals of Rails | 2.28 |
| 9. | Renewals of Ties | 3.01 |
| 10. | Repairs and Renewals, Bridges and Cluberts | 1.81 |
| 11. | " " " Road Crossings, Signs, Cattle Guards, etc. | 0.32 |
| 12. | " " " Buildings and Fixtures | 1.99 |
| 13. | " " " Telegraph | 0.15 |
| 14. | Stationery and Printing | 0.01 |
| | | 20.07 |
| | Maintenance of Equipment: | |
| 15. | Superintendence | 0.63 |
| 16. | Repairs and Renewals, Locomotives | 10.19 |
| 17. | " " " Passenger and Sleeping Cars | 2.07 |
| 18. | " " " Freight Cars | 5.32 |
| 19. | " " " Work Cars | 0.51 |
| 20. | " " " Shop Machinery and Tools | 1.03 |
| 21. | Stationery, Printing and Other Expenses | 0.80 |
| | | 20.55 |
| | Conducting Transportation: | |
| 22. | Superintendence | 1.50 |
| 23. | Engine and Roundhouse Men | 10.10 |
| 24. | Fuel for Locomotives | 10.80 |
| 25. | Water, Oil, Waste and Other Supplies for Locomotives | 1.36 |

| | |
|---|---|
| 26. Train Service | 5.55 |
| 27. Train Supplies and Expenses | 1.91 |
| 28. Switchmen, Flagmen, Watchmen and Switching Charges | 2.36 |
| 29. Telegraph Expenses | 2.44 |
| 30. Station Service and Supplies | 5.62 |
| 31. Car Mileage | 0.61 |
| 32. Hire of Equipment | 0.04 |
| 33. Loss and Damage to Freight, Property, Stock; Injury to Persons and Clearing Wrecks | 1.88 |
| 34. Advertising, Agencies, Commissions, Rents for Buildings, Yards, etc. | 4.66 |
| 35. Stationery and Printing | 0.53 |
| | 49.36 |
| 36. Taxes Paid | 5.64 |
| 37. General Expenses | 4.38 |
| Grand Total | 100.00 |

Average Cost per Train Mile for the Four Years..... $1.17

4123 TABLE NUMBER TWO.

*Statement Showing Distribution of Cost of Locomotive Repairs on Union Pacific Railroad.*

| Class of Service. | Per cent repairs charged each class. | Distribution of contributing causes in per cent. Time and exposure. | Stopping and starting. | Getting up steam and terminal work. | Average curvature. | Average grades. | Distance. |
|---|---|---|---|---|---|---|---|
| Passenger | 31.50 | 2.20 | 4.73 | 5.35 | 0.95 | 4.41 | 13.86 |
| Freight and Work | 43.25 | 3.03 | 6.49 | 7.35 | 1.30 | 6.05 | 19.03 |
| Helpers | 5.46 | 0.38 | 0.82 | 0.82 | 0.16 | 2.18 | 1.10 |
| Light Engines* | 6.38 | 0.45 | 0.64 | 1.08 | 0.19 | 0.32 | 3.70 |
| Switching | 13.41 | 0.94 | .... | 12.47 | .... | .... | .... |
| | 100.00 | 7.00 | 12.68 | 27.07 | 2.60 | 12.96 | 37.69 |

*Light Engine Mileage includes return of helper engines.

Only the first two classes enter into train mileage.

Any increase in repairs and renewals of shop machinery and tools caused by increase in gradients, distance or curvature is considered as proportional to the increase in repairs and renewals of locomotives and cars.

TABLE NUMBER THREE.

*Statement Showing Distribution of Cost of Car Repairs on Union Pacific Railroad.*

| Class of Service. | Total cost per cent. | Distribution of contributing causes in per cent. | | | | | |
|---|---|---|---|---|---|---|---|
| | | Time and exposure. | Stopping and starting. | Switching. | Curvature. | Grades. | Distance. |
| Passenger ..... | 100 | 11 | 20 | 11 | 2 | 20 | 36 |
| Freight and Work. | 100 | 6 | 20 | 16 | 2 | 20 | 36 |

4124 Mr. HILL:

Q. As I understand your views as heretofore expressed in regard to dividing the expense of maintenance of equipment, so far as it relates to coaches, mail and express cars, it is that you must get the expenses accruing to coaches and the expense accruing to mail cars and then to express cars, in order to divide them upon a mileage scale, and then the division should be of the respective classes—that is, a division made of the coach irrespective of the mail and express cars and a division of the express cars made irrespective of the coach and mail cars: is that correct?

A. Yes, sir.

Q. That is your view of the only fair way of dividing maintenance of equipment expense?

A. I would not say the only fair way because you might want to divide it some other way to arrive at a different purpose. But in order to find the cost.

Q. In order to arrive at the truth we are now trying to ascertain is that the only fair way of arriving at the truth?

A. I should say so, yes.

Q. All of the coaches, mail and express cars are lumped together, and the expense paid is a lump sum, and this expense is accruing in seven or eight states, is it a fair division then to divide that lump sum by car mileage, when you divide it between one of those

4125 states as compared with the other six or seven?

A. In order to find the expense between different territories?

Q. Between one territory and the balance of the six or seven territories?

A. If I were to try to find the expense in the different territories I would then work it up on one train here and one train there. I would have trains to deal with instead of individual cars.

And my passenger train expense would be divided on a mileage basis to get the relative cost of the expense in two different states, for instance.

But when it comes to finding out the expense of different classes and perhaps you have different units; and in the other case you have

the same unit—one train in each case—when you want to find out the expense of individual trains, then you must go to the expense of individual cars.

Q. I understand that explanation: but going back to my question, is it a fair division of maintenance of equipment expense of the cars composing a passenger train—that is, of coaches, mail and express cars—is it fair that the expense of an entire system, say an entire road, and the territory through which it runs is say six or seven states, are grouped and all expenses of those different kinds of cars composing the passenger trains being lumped—it is a fair basis, when you want to find out the expense to charge to one state
4126 through which that system runs, to take the expense of that one state as compared with the entire system?

A. I would say very nearly, because the make-up of the different trains in the different states is very nearly similar.

Q. I understand the question of the trains, but this is not a question of trains; it is a question of all passenger coaches, all mail cars and all express cars, the total cost for say eight states?

A. Yes, sir.

Q. And you want to separate the total cost for one state from the other eight states?

A. I should say the mileage basis would be as nearly as you could come to it there.

Q. Would it be a fair basis?

A. I should say so, because the relative number of cars would be operated in the states, according to mileage.

You understand that is a question of trains and not cars. It is a question of trains, as I understand you, not cars; and the same relative number of cars composing trains would operate in the two different states.

Q. You have misunderstood me.

A. You said "total expense."

Q. Yes.

A. That means total trains. There are a certain number of trains operated in this state, and a certain number of other trains
4127 operated in another state and the mileage would be relative, so I say the mileage basis would be right.

Q. If the trains are relative?

A. I say they are relative.

Q. What do you mean by that?

A. I mean about a similar character of trains on our railroad operate in all these different states.

Q. You say your trains are relatively the same?

A. I think they are.

Q. Your trains in Colorado are about the same trains as you have in Arkansas?

A. I should say relatively so, yes, sir.

Q. The expense of car equipment in Colorado is the same as in Arkansas?

A. I don't know whether that would be the same or not. Now

you are talking about cars. You said "trains" before. You mean that is a very distinctive feature, but it may not be to you.

Q. It looks as if we did not understand each other. I will come back to my question again:

Your Missouri Pacific System runs in about eight or nine states, does it not?

A. Yes, sir.

Q. The cars which compose your passenger service, which consists of coaches, mail and express cars,—three different kinds of cars?

4128 A. Yes.

Q. They are repaired in various shops on the Missouri Pacific System?

A. Yes, sir.

Q. Those expenses as a whole for those three kinds of cars are thrown into a lump sum, say so many million dollars for a given period, and say six months, and then the car mileage in Arkansas and in all these other seven states, is taken; and that gross sum is divided between Arkansas and those other seven states on the basis of the car mileage of those cars; I ask you if that is a fair division of the expense between Arkansas and those seven other states?

A. I should say yes.

Q. You would say it is?

A. Yes, if I understand you aright I should say yes it was.

Q. When you come to sub-divide them as between trains it is not a fair division?

A. This is trains.

Q. No, I didn't ask you a word about trains. I asked you about cars that compose trains. Not trains. I am taking a car as a unit and disregarding trains entirely in my question.

You may have the question read to you and you will see that the word "trains" is not mentioned at all. We are dealing with cars as a unit, and those cars are three separate kinds.

4129 A. I should say that the division of the total cost of repairs to cars, wherever they may run, should be on the basis of the relative cost of the different classes of cars. In other words, if a train of cars has made the same mileage as another train of cars the division of expense on them should be per mile, according to the work done, in order to put those cars in condition to go out again. That is no individual car, but irrespective of what the car is or what it does. That is merely doing the work required on the car for a given distance that the car runs.

I do not see what else it could mean if you are trying to get at the division of what the repairs on the different cars cost.

Q. Then it is fair to divide the cost of maintenance of coaches, mail and express cars as between states, but it is not fair to sub-divide it, when you come to apportion it between the different kinds of that service; that is, passenger coaches, mail and express cars; is that your proposition?

A. Yes, sir.

Redirect examination

By Mr. MOORE:

Q. When you say it is fair to make a division between states, you mean it approximates as closely to what is correct as it is practical to attain, do you? You do not mean it is an accurate division according to actual divisions, but it is as near as you can attain to a division of that character?

4130 A. Yes, sir.

Q. And if you were going to make a division on a large system of road, the cost of car repairs between two or more states, you don't know anything that would be fairer than that in its approach to correctness?

A. No, sir.

Q. The State in this case has assumed it is going to abandon all theories of division, and dissect this job and cut it up into small parts and then divide the expense of operating those parts on an actual basis; now, when you have ascertained the cost applicable to one state for maintaining passenger cars, then if you wanted to divide that cost among the different classes of cars on an actual basis, and abandon what the defense assumes to be its theory in this case, you would then separate the classes of cars and divide it upon the basis of the expense of each class, instead of the total car mileage of all classes?

A. Yes, sir.

Q. And you say that is necessary if you want to get an accurate division, on account of the fact that one class of cars costs more per car, per unit, to keep in repair than another class?

A. Yes, sir.

Q. That sums up your views in regard to it?

A. Yes, sir. That is an actual and not a theoretical view.

4131 Recross-examination.

By Mr. HILL:

Q. Suppose the car maintenance of equipment expense for a year on a system for eight states was for example $800,000, and that included these three classes of cars, coaches mail and express cars, all lumped together constituting $800,000, you would divide that between one state that is going to secede from the "pool" on a car mileage basis; and say that state's proportion assigned in that way would be $100,000: And you wanted to divide that $100,000 between passenger coaches, mail and express cars, inside the state, how would you do that?

A. I would take the miles each car made and the cost it would take to maintain the car during the period in question, on each class of car.

Q. How would you ascertain that cost?

A. Take it off the time books.

Q. But we have started with a lump sum. That is the only factor you have.

A. But we had to get the lump sum off the time book to begin with.

Q. I assume so, but it was all lumped into $800,000 for the entire system?

A. I say you would have to go back to the time book.

Q. That is the only way you could do, go back to the time
4132 book?

A. You would have to ascertain the cost of the repair and the time required on each car.

Q. Then if you go back to your time book and locate the actual expense of each class of these cars during that period, from your time books, how would you apply that to the $100,000 that had been arrived at by not making it up from the time book?

A. How can you arrive at the $100,00 without going back to the time book? I say you cannot do it. Unless you have your time from the payrolls to start it out how can you get the $100,000?

Q. I understood you to say a while ago here is a whole system of cars lumped together for eight states, amounting to $800,000: you would divide that between Arkansas and the other seven states on a car mileage basis of all cars, irrespective of their class. And that would produce say $100,000, to illustrate.

Now you say when you go to divide up that $100,000 between those three classes of cars you have got to go back to your original books to find out how the respective expenses accrued to each class: that is true, is it not?

A. I made the remark that you would have to do that in any instance, at any time.

To get the cost of maintaining cars, to get the actual cost, must be the actual money spent on the cars, regardless of the states.

When you come to divide among the states I think rela-
4133 tively the mileage basis would be fair.

Now, if you start with $800,000 you start with that because you must first get your $800,000 and you must add your labor and material cost together. But when you start with $800,000 you do not have to go back because you already have it.

Q. You ought not use that, to start with, to divide between Arkansas and the other seven states, ought you not to go back to the original data?

A. It is the same thing. Your percentage will have to balance the $800,000, if your figures are correct.

Q. It would have to balance the total, of course?

A. Certainly.

Q. But now you have separated one part of that system on the mileage basis which you say is not correct—at least, you have heretofore said it was not correct?

A. I guess it is as near correct as you can get.

Q. I am not asking about "near correct" but I ask you if it is correct. And when you sub-divide it you say you have to go back to the original figure out of which the lump figure was made: is that true?

A. I don't know that I understand what you mean.

If I spent a certain amount of money and I keep an individual account of it I surely can say what I spent it for,—if I spent $100 at the end of the month I ought to be able to know what each item costs me. I don't understand where you get your lump sum.

4134 Q. You have made up a lump sum of $800,000, which represents all these various expenditures?

A. Yes, sir.

Q. On all these cars, irrespective of their class?

A. Yes, sir.

Q. Of course, you have made some data—I don't know what you call your office data—but you have some data which represents or could represent every nickel of that $800,000?

A. Every cent of it.

Q. You found for a period of six months that $800,000 is the gross sum—instead of calling it a lump sum I will call it a gross sum—that has been spent for the expense of repairing these three kinds of cars. Now, you are called upon to divide that gross sum between one division, being one-eighth of the whole, do you divide it upon a car mileage basis? Ignore the fact that the coaches have been more expensive or the mail car more expensive than the express car. You throw it all together and divide it upon a car mileage basis?

A. I think that would be approximately correct, correct enough for the purpose but not for actual purposes. For actual results you must take each car and what it costs.

Q. For example, say that $100,000 is the expense accruing to Arkansas, or that has accrued within that given period. Now suppose you want to divide that between these three different

4135 kinds of traffic operating in the State of Arkansas: you would not apportion that upon the car mile basis, then?

A. I would not apportion it upon a car mile basis at any time. I have said that several times. I say, for different parts of the road, the car mile or the train mile might be as near as you can get to it. But that is not going into individual costs. You are dealing with trains in districts, and not cars. You do not run cars in districts but you run trains in districts.

Q. You do not run these cars in Arkansas but you run them as trains: is that the distinction?

A. You would compare the cars in a train, as I understand it. In districts you are comparing the trains with trains, made up of equipment cars.

Q. That is your definition. I am not assuming it and I do not think these statistics have assumed it in this case at any time. I think you have injected that into your case although your counsel is not familiar with it.

Taking our former sum of $100,000 and we wish to divide between coaches, mail and express cars, having reached that $100,000 on a car mile basis how are you going to divide it between the three classes of service?

A. By the classification of the cars and I think arbitrarily the other should be done the same way.

Q. In other words, is not this a fact: if you use the actual figures in one case you should use them in the other?

4136 A. I should say so.

Q. If you use the unit which is a relatively correct unit, in one case, you would have to use it in the other, wouldn't you?

A. Yes, sir.

4137 H. B. AUMOCEK, a witness of lawful age, being duly produced, sworn and examined on the part of the complainants in rebuttal, testified as follows:

Direct examination.

By Mr. MOORE:

Q. State where you live and what your occupation is?

A. I live in St. Louis. My occupation is Chief Mileage Clerk of the St. Louis, Iron Mountain & Southern Railway and Missouri Pacific Railway.

Q. How long have you been with them in that service?

A. Five years on the 23rd day of this month.

Q. You have to deal with the records, do you, which shows the movement of trains and the mileage made by them?

A. Yes, sir.

Q. Have you prepared a statement from the wheel reports showing how cars in through trains are handled in the terminal yards at Hoxie?

A. Yes, sir. That is, showing the way cars moved in and out of Hoxie.

Q. What are the compilations that you have made taken from?

A. They are taken from the conductors' wheel reports.

Q. How many have you prepared?

4138 A. 37.

Q. Are those 37 part of the trains shown on the sheets of Mr. Hamilton which have been testified to in this case?

A. Yes, sir.

Q. Did you adopt any rules in selecting the trains with reference to the sheets prepared by Mr. Hamilton?

A. I was instructed to pick out the trains which showed the largest number of cars.

Q. As being the most representative?

A. Yes, sir, that would be the most representative.

Q. Have you had any of these sheets prepared and typewritten so as to be used as exhibits in this case?

A. Yes, sir.

Q. How many of them?

A. Six.

Q. And are these compilations you have made fairly representative, you think, of the movement and the handling of cars in that station?

A. I think they are.

I did not try to pick out the best ones. We were working on

them and I simply chose the ones that happened to come first in the terminals I was working on.

Q. Those that would represent the largest trains shown on your sheets?

A. Yes, sir.

Q. I want you to file those that you have had typewritten
4139 in such a way as they can be put into this case as exhibits, as Exhibit 52.

The papers referred to are marked "Complainant's Exhibit H. B. Aumocek, 52."

Said exhibits are in the words and figures following to-wit:

For Exhibit 52, see Volume 8, page 5683.

4140 Q. These exhibits show the cars that came into and went out of Hoxie on each of the trains which is referred to in the exhibit, do they?

A. Yes, sir.

Q. And do they show the same with regard to the station of Little Rock, the cars that came into Little Rock and went out of Little Rock on the same train?

A. Yes, sir.

Q. You have filed exhibits covering six of these statements: you have 31 that were not prepared to be offered as exhibits?

A. Yes, sir.

Q. Are they prepared in the same way except that they are in pencil form?

A. Yes, sir.

Q. In order to prevent making too bulky a record I will offer only those that you have typewritten, as exhibits in the case and you may hold the other 31 subject to the inspection of the attorneys and experts for the State in this case?

A. Very well.

Q. I have in my hand here exhibit 52, sheet 1: it shows a train that came into Hoxie on October 1, 1907: where did that train come from?

A. It came from the north.

Q. It was a through train, was it?

4141 A. Yes, sir.

Q. What hour did that train arrive at Hoxie?

A. At 3:35 P. M.

Q. Does the first column to the left on that part of the sheet which relates to the cars in and out of Argenta show what cars came into Argenta on that train?

A. It shows the cars into Argenta on train number 55.

Q. I want you to explain one thing: that train is marked "second section train number 71": explain that if you please?

A. Train 71 evidently had more business to handle than they could in one train and this is the second section of train 71.

Q. To go back to what I asked you a while ago: does the first column to the left, to which I have referred in the question asked a moment ago, show the cars which came into Hoxie on that train?

A. It shows the number of cars coming into Hoxie on train second section 71.

Q. What do the next three columns show, headed October 1, 1907, 11:20 P. M.?

A. That shows when these cars moved out of Hoxie.

Q. What time does this sheet show they came into Hoxie?

A. They came into Hoxie at 3:35 and left at 11:20 P. M. of the same day.

Q. The fourth and fifth columns, train No. 55, show the
4142 number of the train that carried them out?

A. Yes, sir.

Q. All of those cars came in in that way and went out at the hour you mention?

A. Yes, sir.

Q. That train you say left Hoxie at 11:20 P. M. on October 1st?

A. Yes, sir.

Q. When did it arrive at Argenta?

A. At 2:20 P. M. of the 2nd of October.

Q. Does the second set of figures represent the trains in and out of Argenta and show when the cars in that train arrived at and when they got out of Argenta?

A. Yes, sir.

Q. Explain those columns: What does the first column to the left of that set of figures show?

A. It shows the cars that moved into Argenta on Train No. 55 at 2:20 P. M. of October 2nd.

Q. Does the sheet show when those cars left?

A. Yes, sir, they left at 6 p. m. on the same day on train first 81.

Q. All except those which are marked different in the column?

A. Yes, sir.

Q. If any of those cars did not leave at the hour and on the date you mention, it is shown below under the appropriate
4143 headings, on what day and at what hour and on what train they did leave?

A. Yes, sir.

Q. The last two right hand columns, trains and train number, of the Argenta column shows on what trains those cars went out?

A. Yes, sir.

Q. What is that?

A. First train 81.

Q. That is a through train, is it?

A. Yes, sir.

Q. The same explanation that has been made of the figures on this sheet will apply to the sheets on each one of the sheets constituting this exhibit, will it not?

A. Yes, sir.

Q. The figures above the double line to the left, on sheet one, to illustrate, reads:

"Into Hoxie, October 1, 1907, 3:35 P. M., train 2/71."

That intends to indicate the date on which the cars on that train reached Hoxie?

A. Yes, sir.

Q. And similar figures on the right hand side of the sheet relating to Argenta have the same significance as to the time of the arrival at Argenta?

A. Yes, sir.

Q. And that is so all the way through?

A. Yes, sir, that is the case on each sheet.

4144 Q. I see one of these sheets, Number 5 of this exhibit, shows cars into McGehee station?

A. Yes, sir.

Q. And those figures have the same bearing and effect with regard to trains in and out of that station as you have described with reference to these other sheets?

A. Yes, sir.

Q. How many cars does this sheet show went into McGehee on that train #182, on the 7th of October?

A. It shows 52 cars moving into McGehee.

Q. How many went out on the same day?

A. 51 of those same cars moved out of McGehee on train 182 of the third day at 10 A. M.

Q. Arriving at 11:30 A. M. on the second they went out at 10 A. M. on the third?

A. Yes, sir.

Q. I wish you would turn to the work sheet of Mr. Hamilton from which that exhibit of yours was prepared and examine that sheet and state if it shows that all those cars were handled at that station?

A. On Mr. Hamilton's work sheet he shows it here on the first day: Second 182 with 53 cars into McGehee. I have shown only 52 because I did not include the caboose.

Q. But with the caboose it would be 53, as he has it there?

A. Yes, sir.

Q. How many cars does he show out on Train 182 on the

4145 third of October?

A. As shown on Mr. Hamilton's work sheet there were 62 cars.

Q. How many of those were the same cars that came in on 182 of the second?

A. Fifty-one.

Q. The work sheets show that 53 cars including the caboose, came in on the first day?

A. Yes, sir.

Q. And 51 of the same cars went out on the next day?

A. You are speaking of Mr. Hamilton's work sheet?

Q. Yes.

A. He does not show how many of those same cars went out. He shows the total number moved out.

Q. But 51 of those cars were the same cars?

A. Yes, sir.

Q. The wheel reports show that?

A. Yes, sir.

Q. Excluding the caboose that makes 103 cars that Mr. Hamilton's work sheets show received terminal handling in and out of that station, that came in on that train?

A. Yes, sir.

Q. The same rule for ascertaining the number of cars handled in and out applies to all the cars shown on those work sheets, does it?

A. Yes, sir.

4146 Q. That is as shown by his work sheets contained in these exhibits?

A. Yes, sir.

Q. He gives them as handled in and out of stations whether Hoxie or Argenta or McGehee?

A. Yes, sir.

4147 B. W. MOORE, a witness of lawful age, being duly produced, sworn and examined on part of the complainants in rebuttal, testified as follows:

Direct examination.

By Mr. MOORE:

Q. State your name and residence.

A. B. W. Moore. I reside at Little Rock, Ark.

Q. What is your occupation?

A. Train Master.

Q. Where?

A. Train Master of the Pine Bluff District of the St. Louis, Iron Mountain & Southern Railway.

Q. What was your occupation in October, 1907?

A. Night Yard Master at Little Rock Terminals.

Q. What were your duties as night yard master at the Little Rock Terminals in October, 1907?

A. To handle all trains, make up and receive same.

Q. I hand you some sheets of paper showing the "consist" I suppose you call it, of the St. Louis through freight trains to Texas, being train No. 55, during each day of the month of October, 1907. I wish you would attach it to your testimony as Exhibit 53.

4148 The paper referred to is marked "B. W. Moore Exhibit 53."

Said Exhibit is in the words and figures following, towit.

For Exhibit 53 see Volume 8, page 5690.

4149 Mr. MOORE:

Q. I want you to show me on these sheets how you handle the cars in the consist of these trains. Take any one of them. Take this sheet (indicating). What I want you to show, Mr. Moore, is how those cars in that train would be handled and what movements would be necessary to be made in handling them, both in regard to trains that went out, going through to Texarkana and points beyond, and those which had to be switched off at Little

Rock, either for local purposes or to be put in other trains. Better begin with the cars going through Little Rock South.

A. (After examining paper handed him). It is shown by this consist that the cars destined to Texas are in the train beginning from the caboose, including 42 cars destined to Texas, and ahead of those are cars for the Valley Division and Little Rock proper and local South, or short points beyond Little Rock.

Q. Which cars were in the front of the train: those at the top or those at the bottom?

A. The first car mentioned on the consist, at the top, is the car next to the caboose.

Q. That is at the rear of the train?

A. Yes, sir, and following on up to the engine.

Q. The last car on that list is the car which is next to the engine?

A. Yes, sir.

4150 Q. You say there are 42 cars shown on that list, that were going to Texarkana?

A. Yes, sir, 42 to Texarkana, and 16 which were on the head end of the train.

Q. What would you do in the way of switching and cutting in order to get those 42 cars standing there switched and ready to go on to Texarkana?

A. Those 42 cars would remain on the train on which they were received, and the 16 cars would be taken off the head of the train and put on such tracks as are designated for that purpose.

Q. We will leave out the 16 cars at present and deal with the 42:

What would be done with those 42 cars, so far as switching in that yard is concerned?

A. They would remain on the track on which they were received, and there would be added to that train tonnage and forwarded from the track on which we received it. They would not be switched.

Q. There would be no switching service at all in connection with them?

A. No, sir.

Q. You would send them out in the order they come in?

A. Yes, sir.

Q. With a caboose at one end, or if you wanted to put on additional cars on that train you would put them on one end,

4151 then attach the engine and pull out the train?

A. Yes, sir.

Q. That would be all the switching you would render to the cars going through?

A. Yes, sir.

Q. In going through those sheets I see on every day large groups of cars—for instance I have one before me that shows twenty cars going to Texarkana in a group. Then there is another that has forty or more cars in a group. I won't stop to count them. All the cars, in all cases, on each of those sheets, cars that were going to Texarkana and grouped together, would be left together without

doing any switching to them and without any additions, except to add cars to them in going out.

A. Yes, sir, that consist there indicates how they come out of Hoxie. It is figured that way. Such cars as are grouped there remain intact, while in the Little Rock terminals, and they are added to to make the train mile tonnage.

Q. The sheet I first called attention to happened to be one showing the consist on October 2, 1907: referring to that particular sheet now for the purpose of illustration, what appears on the others right below the 42 cars on the sheet is 4 cars to Little Rock: what would be done with those cars?

A. It would be according to what their final destination
4152 is. If they are for city delivery or according to what industries they are consigned to.

Q. If it is for city delivery what would be done with them?

A. They would be switched to an assigned track in the terminal yards and then transferred from there to the industrial tracks either at East Little Rock, Little Rock proper or Argenta, according to where the industry was located.

Q. Would the switching movements on those cars at Little Rock be a separate movement for each car, or would it be that one movement would cover for the whole of them, for any part of the switching movement you had to perform?

A. If one or more cars were assigned to one industry, and they were together in the cut or group, they would remain intact. Otherwise there would be a switching movement for each car.

Q. If they were going to different places there would be a different switching movement for each car?

A. Yes, sir.

Q. The next five cars are destined to points on the Valley Line—Alexandria, McGehee and three to Monroe: what would be done with those cars?

A. Those cars would be switched to an assigned track in the receiving yard, which is Baring Cross Yard, and then transferred from
there to the Valley Yard, which is about three eights of a
4153 mile or more distant, and there they would be made up in train order.

Q. Two movements would cover that switching?

A. Yes, sir.

Q. How many movements would ordinarily be required to cover a car that was destined to Little Rock, say to some industry about Little Rock?

A. They assigned to separate tracks. In territories in East Little Rock we assign them to track 15. Then they go to East Little Rock and are switched to assigned tracks, which we term "make-up" tracks, and then from there to the industrial track to which they are routed.

Q. You first cut them out of the train they come in on and take them over to what track?

A. To the make-up track in East Little Rock.

Q. That is two switching movements?

A. Yes, sir.

Q. And then where do you take them?

A. Then we switch them to an assigned track, or the transfer engine gets hold of them.

Q. That is three switching movements?

A. Yes, sir.

Q. And then what is done?

A. Then we transfer them to the track from which they are unloaded. That is four switchings you make on an industrial car after they are received as they come in on the train.

Q. In view of the location of the industries about Little
4154 Rock with reference to the Baring Cross Yards, at which through trains are received, how does the switching service rendered to cars destined to Little Rock and that rendered to cars which are attached to trains going East and West on the Ft. Smith and Valley Divisions compare? Which has the most switching and how much more?

A. In making a comparison of the switching we make four to one movements against industry switching, compared to what we term train line movement.

Q. You mean a car going to an industry has four times as much switching?

A. Four to one as compared with a train line car. For instance, an industrial engine will operate on 75 cars as against 300 to 350 or 400 cars handled by the train line engine.

Q. That illustrates the difference?

A. Yes.

Q. 75 to 300 or 350?

A. Yes, sir, out of the ten hours.

Q. The average will run from 75 train line cars——

A. 75 industrial cars against 300 train line cars.

Q. That is what I mean.

A. That is our comparison and the way we figure the comparison of expenses in operation.

Q. Four or five times as much?

A. Yes, sir, and it would cost us $2.50 to $3.00 per car
4155 for industrial switching.

Q. How does it cost for the switching movement, in view of the kind of switching movement, in order to transfer cars to industries around Little Rock, as compared with train line switching? How does it compare? Is the distance greater or smaller?

A. The distance is much greater. We receive our trains on receiving tracks convenient to the intersection of main lines, and our trains are handled as they are received, cutting out the industrial cars, line them for such assigned tracks as we assign them for, and then our transfer engines are used for the purpose of moving them from those tracks to the industrial tracks.

Q. What you have said in regard to the manner of handling the consist of the train of October 2, 1907 applies to all trains, does it?

A. Yes, sir.

Q. When did you come to the Little Rock yards?

A. October 1, 1907.

Q. What was the condition of that yard when you came there, in the way of congestion?

A. The terminals——

Q. I just want to know if there was considerable congestion there.

A. Yes, sir considerable congestion.

Q. Do you know what brought about that congestion?

4156 A. The heavy movement of business and the failure of the consignors to unload their cars promptly.

Q. Do you know whether that was done in that section and along that line?

A. It was in that section and also in Chicago, where I had just come from.

Q. How was it in Memphis?

A. There was the same congestion in Memphis.

Q. And how about the Rock Island at Little Rock?

A. The same conditions.

Q. And how about Texarkana?

A. The same condition.

Q. It was nothing peculiar to the Iron Mountain?

A. No, sir, there was a general heavy movement of business.

Q. You at once took charge there as Night Yard Master, I believe, in those terminals?

A. Yes, sir.

Q. Did that congested condition have any effect in loading up any of the trains either local or through, more heavily than is ordinarily done?

A. We utilized the power to all the advantage we could naturally put it to——

Q. What did you do in order to accomplish that?

A. We added to our local movements and added tonnage

4157 of probably 500 to 600 tons.

Q. To the train?

A. Yes, sir, to the train.

Q. What was the object of that?

A. In order to move as many cars out of the terminal and get them to their destination as quickly as possible on the train movements, the number of trains moved.

Q. Now, as I understand it, the through trains at all times carry a larger tonnage—in other words, you try to move those to the full capacity of the engine; that is, at all times on the through trains: is that true?

A. At all times the full capacity rating of the engine is given in through train tonnage.

Q. That is not true of the local trains? They do not load to the full capacity of the engine pulling the local trains. Now, what was the class of tonnage that was added, as a rule, to the loading of the local trains?

A. Our added tonnage——

Q. What I mean is—perhaps you do not know what I am directing your attention to:—did the added tonnage consist of through or local freight?

A. The added tonnage was the excess or cars which were accumu-

lated from trains from St. Louis, Kansas City, New Orleans, Alexandria and Memphis, going to local points in the local territory or the division territory.

Q. Explain now about how that would be done. For in-
4158 stance, loading a local train South on the main line from Little Rock to Texarkana, with additions from such trains as you have spoken of just now, what class of freight would be put on it?

A. Ordinarily and as a usual proposition and also by the direct instructions for the operation of local trains, they could only handle, in order to serve their requirements, such cars containing less than car load or local freight to points on the territory in which they move. Or, cars consigned in car load lots from points on that territory to points moving from that territory and not beyond the destination of the local run.

Q. You say that is the ordinary loading of the local run?

A. Yes, sir.

Q. And what change was that?

A. Our Superintendent, Mr. Cannon, issued instructions to utilize the local power to the best advantage in the movement of business and not to exceed on the local trains, which had light engines of 1200 tons capacity, not to exceed 1000 tons on each local division. Those instructions, so far as I can remember, were carried out to the letter.

Q. Mr. Moore in ordinary times, not taking a congested period such as I was speaking of, in October 1907, but under ordinary normal conditions, what percentage of a local train would be
4159 interstate freight or through freight rather? Now, I am not speaking of an abnormal or unusual time, but just ordinarily.

A. Ordinarily the local would handle only such local cars, less than car load or car load shipments that originate on the local division.

Q. The point I want to get at is, if you can state it, about what proportion or what percent of the loading of a local train, in ordinary and usual times, would be interstate and through freights, and what proportion would be purely local business. That is what I want to undersatnd.

Mr. HILL: Are you using the terms "through" and "interstate" as synonymous?

Mr. MOORE: In a sense you might say they are synonymous. I doubt if Mr. Moore is sufficiently advised to answer that question.

Q. If you are not sufficiently advised to answer that question I will with draw it.

A. I would not care to answer the question as you have put it unless I was clearly familiar with what the question is whether it is interstate business going to local points on the local territory, or state business originating on the local territory.

Q. I will pass that.

You say there was a large addition to the loading of local trains

during that month of October, 1907, on account of that congested condition of the traffic.

4160 A. Yes, sir.

Q. And a great part of the loading came from trains from St. Louis, Memphis, New Orleans and other points elsewhere outside of the State of Arkansas?

A. Yes, sir.

Q. What was the condition in that respect of the local trains that came into Little Rock from Hoxie? Did they have any unusual accession of loading of that class of freight that came from points outside of the State?

A. Yes, sir, the local trains would come in with its full capacity of engine tonnage, in every nearly all cases, both North and South, accumulating that tonnage from the White River Division at Newport and the Memphis Division at Bald Knob, making pick-ups at both stations, and coming into Little Rock with full engine tonnage.

Q. What was the character of freight they picked up at Newport and where did it come from?

A. What they picked up at Newport came from Springfield, Mo. and on the Missouri Pacific territory, in which the business moves over the White River Division, Cotter and so on.

Q. How would it be about that you picked up at Bald Knob? Where would that come from?

A. That would come from the Memphis territory, which would move from Memphis to Bald Knob on the Memphis territory.

Q. I hand you sheet three of Exhibit 52 in this case,

4161 filed by Mr. Aumocek: this exhibit shows the number of cars that went into Hoxie on train 71 on October 12th 1907, and it shows when those cars went out. It also shows the cars on the train that came into Argenta on the 13th of October and went out on the same day.

Now look at that consist and state what handling, according to that which usually prevails in all terminal yards, would be given to those cars.

A. (after examining paper): From the consist given here——

Q. That is what I want you to state, from the face of the consist.

A. The star would indicate such cars as were not consigned through to Texarkana, and the final destination would indicate here that all the cars that were in the train were through cars.

Q. Yes, that is what that indicates. Would there be any switching service to those cars?

A. The seven head cars would be taken off the train on their arrival at Little Rock.

Q. That is on train No. 55?

A. Yes, sir, that is No. 55.

Q. Would it be necessary to do anything to the rest of them?

A. No, sir, the rest of them would remain intact, as they were received, getting no switching at all except putting on the

4162 engine and adding to these cars such tonnage as would make up the train out of Argenta.

Q. Take a train into and out of Argenta, say train No. 71: take

that consist on its face and show what services would be rendered there.

A. Train No. 71 out of Hoxie into Argenta and out of there is No. 55.

Q. But I am talking about this (indicating paper): take the same thing for Argenta.

A. That is a straight train, there is no exception.

Q. That train arrived, according to that exhibit, on the 12th of October at 2:50 P. M. and went out at 4:20 P. M. on the same day: does that exhibit show there was or was not any service at all, or that it went right through without any service?

A. That train went through solidly, without any disturbance or switching at Argenta. There was no occasion to make any switching on it, as it was consigned to a point beyond Argenta, being consigned to Texas.

Q. Here is sheet 5 which shows a train that came into McGehee on the 2nd of October at 11:30 A. M. and went out on the next day at 10 A. M. It shows one car was set out at McGehee: what switching would be necessary there and to what cars?

A. All the switching necessary to be done on that train would be to remove the car as noted by the star there (indicating)
4163 the third car from the caboose, which would be set out and the remainder of the train would remain intact.

Q. How would that be done to set that car out?

A. The switch engine would couple on to the rear end of that train, on to the three rear cars, and they would switch that car out, then put the caboose on to the other two cars and go ahead.

Q. There would be more switching service to that one car than to the rest of the whole train?

A. There would not be any service to the rest. There would be one move of the two rear cars which were behind the one that came out.

Q. What you have said in regard to the switching movement in handling those cars on the exhibit to which I have called your attention, and to exhibit 53 as shown by you, is true in all cases, isn't it? Wherever there is a body of cars coming in on these trains, that are going through, you do not touch them: is that true?

A. Yes, sir. They are not handled or "shifted" as we term it.

Q. If there are some cars on there going out on other lines and some destined to Little Rock, the switching in that case is to the cars going on other lines or cars set out at Little Rock, isn't it?

A. The switching is setting out those cars which may come out of the train, that are consigned to yards at Little Rock or not in the direction in which the train is moving.

4164 Q. But if there is a block of cars ten or twenty or forty that are going through, they remain intact; they receive and require no switching, do they?

A. No, sir.

Cross-examination.

By Mr. HILL:

Q. Mr. Moore on leaving a terminal would the conductor's wheel reports show the cars in the trains in their exact relation position?

A. The wheel report relative to the position of the cars in the train does not indicate as to their position. The conductor shows foreign and system equipment, in the lines prescribed, on the wheel report, and his wheel report will show the point from which received and the destination, but not the position in which they are located in his train.

Q. My question is, when leaving a terminal—say on leaving Hoxie—how would the conductor's wheel report show that train on leaving the Hoxie terminals?

A. His wheel report would show, just as I have answered the question, in numerical order, separating the foreign from the system cars, and the empties from the loads, but not respecting the position in which the cars are located in his train. His "consist", 4165 which he gives to the Superintendent, would indicate the position in which the cars are located in the train.

Q. Do you remember the change in the form of conductor's wheel reports on the Iron Mountain?

A. There is a change but I am not familiar with the change. The new form is being used whenever the old form stationery is exhausted.

Q. Here is a form, Mr. Moore (handing paper to witness), I don't know anything about it, whether it is new or old, but I reckon you do. It is filed as an Exhibit in this case.

You recognize the form, on the face of it?

A. Yes.

Q. It is form 223?

A. Yes.

Q. On the back of this form are instructions and I wish to call your attention to No. 2:

"Cars must be reported in train order commencing with the caboose, to show the make-up of trains leaving district terminals."

A. Yes, but those instructions are not governing this wheel report, but governing other reports made by the conductor as to his consist.

Q. Aren't you mistaken about that? Look at the instruction No. 2, to which I have called your attention, and to instruction No. 1, just above that. That states:

"This report must be filed promptly with the agent or 4166 operator at the end of each trip and receipt taken in train book for the same."

Doesn't that refer to the instructions on this wheel report?

A. Those are instructions and they are literal in a way, but they are not applicable to certain territories. For instance that rule there, on our territory, cannot be applied.

Q. In other words, you mean those are the instructions that apply to it, but they are not always carried out?

A. The instructions are for the benefit of the car accountant to

handle your cars numerically, foreign and system separately, in order for the car accountant's office to handle them more rapidly through their office for records. For that reason this column in here (indicating) is shown as indicated. You could not show your cars from the caboose to the engine, as you could not tell where or how many cars on a local train you would handle through from terminal to destination.

Q. When you are leaving a terminal and making up a wheel report, why cannot the conductor report them in their order in the train as well as in some other manner?

A. You do not make that wheel report until you are at your destination. That is, you do not file it as a matter of record until you have completed your trip.

Q. Do these various consists you have filed here—Exhibit
4167 55 I believe it is—agree with the wheel reports?

A. I am unable to say whether they do or not. I have not seen the exhibits compared with the wheel reports.

Q. How do you know this is the order of the train, just taking the face of these consists?

A. Just as my evidence would indicate, that that is the usual way.

Q. As a matter of fact you do not know whether that order was carried out or not, do you?

A. There may be some exceptions, but as a general proposition those are the instructions. And as practice has shown me, I have found them such.

Q. That is the way it should have been?

A. Yes sir, that is the way it should have been.

Q. And most generally it is?

A. Yes, sir, and we figure it that way in operating our terminal or division yards.

Q. But as a matter of fact you do not know whether these consists you put in evidence here are correct or not, do you?

A. I did not make them out. I mean I did not check them to see.

Q. You do not know but what they may be copies of the wheel reports?

A. I am satisfied that they are not copies of the wheel
4168 reports, as the records of these consists are kept in the office of the Superintendent of Terminals at Little Rock, while the wheel reports are forwarded direct by the conductor to the car accountant at St. Louis. We never have an opportunity to see the conductor's wheel reports in connection with what he gives us on the consist.

Q. Were these consists you put in evidence here made up in your office?

A. They were made up in the office of the Superintendent of Terminals, I presume.

Q. At Little Rock?

A. At Little Rock and Hoxie.

Q. I would like to have some of the wheel reports of October, 1907, showing the form used at that time you speak of. This con-

gestion which you found existed when you went to the Little Rock yards on the first of October, 1907:

How long did that congested condition of affairs continue?

A. Well, it continued up until some time in January.

Q. About when did that congested condition begin?

A. I was on the Illinois Central and I was General Yard Master at Mound, Ills., and it struck the Illinois Central about the 15th of June. I went to the Indiana Harbor Belt Line at Chicago and found the conditions there very congested on the 22nd of August. I remained with that Company up until Mr. Cannon sent for me on the first of October, when I entered his service.

4169 Q. You say it passed away about December or January?

A. It was in January, if I remember correctly.

Q. I will call your attention to the fact, Mr. Moore, that the panic struck the country sometime in October, and if I remember correctly, was in the early or middle part of October of that year.

A. About the 22nd of September—that is, it started then.

Q. The effect of that was that it took some little time for that to be felt in the freight traffic of railroads?

A. Yes, sir, it took up to December.

Q. There was no congestion of traffic in March, 1908, was there?

A. We had a normal movement of business which was moving during 1908.

Q. There was no congestion then, but there was a normal movement?

A. Yes, sir, there was a normal movement. We had a heavy movement of business but no congestion to amount to anything.

Q. You have described the switching as between trains and cars that would come in on trains from St. Louis and go through to Texarkana, and those that would be delivered at Little Rock: I wish you would describe the switching movement of a car of cot-

4170 ton, which, for instance, would come into your yards at Argenta from Morrillton—just describe the switching movement on that car of cotton.

A. A car coming in from the Central Division would be received in what is known as the Valley Yard. If it were consigned to an industry in Little Rock or Argenta it would be switched to an assigned track.

Q. It would be consigned to some compress I suppose?

A. It would be switched to an assigned track in what is known as the make-up yard. Then the transfer engine or the industrial engine assigned to the industrial work would come and get that car, or other cars, and take it and set it to the industry.

Q. It would be a compress in the case of cotton?

A. Yes, sir, it would be to a compress in the case of cotton.

Q. Then what would be done with it?

A. The car would be unloaded at the compress, compressed and then reloaded.

Q. Then what would you do when you would pick up that car again after the cotton had been compressed?

A. We would take it out of the compress to the make-up track

and add it to the cars that were added to the tonnage at that point, or the extra trains which originate at that point.

Q. How many switching movements would there be on
4171 that cotton, those four cars?

A. Two to the compress and two from the compress out to the train.

Q. How would that switching movement compare with the movement to an industry in Little Rock—say a shipment of shoes from St. Louis to Little Rock?

A. It would compare equally, if not the same. If the car was not assigned to the house—or to the houses I would say—the merchandise houses.

Q. I mean an industrial delivery. Take a car load of shoes from one of these big shoe concerns in St. Louis, shipped to a dealer in Little Rock: how many switching movements would there be on that car?

A. Four switching movements to the industry.

Q. The same switching movement on that as on the cotton?

A. Yes.

Q. That cotton would likely come in on a local train, wouldn't it?

A. No, sir, not necessarily.

Q. Very frequently it would?

A. In some cases it would and in other cases we run what is known as a pick-up train for cotton, or a cotton train.

4172 Q. Going back a moment to this delivery of a car of shoes to an industry at Little Rock: you say there would be four switching movements to get that car to the industry?

A. From the train on which it arrived to the industry, there would be four switching movements to get it there.

Q. Describe what those movements are.

A. From the train to the assigned track; from the assigned track to the delivery track in East Little Rock; there the delivery engine delivers it to the industry track on the "make-up" track, and the industry engine takes it from there to the industry.

Q. It makes practically the same number of switching movements as the cotton?

A. Every car practically that comes into Little Rock receives four switching movements from the track to the industry, and probably by four different engines.

Q. Is that true of other terminals in Arkansas?

A. Where there are industries. The movement by the road engine at Hoxie and then the movement by the road engine to the industry would make only three movements. But the peculiar condition at Little Rock and the distance you have to handle your industry business, taking that into consideration you have got to make four switching movements.

Q. That grows out of the fact that Little Rock is in a separate place from your tracks in Argenta and the industries are
4173 across the river and you have switching yards across the river from your industries?

A. Yes, sir.

Q. How many movements would you have to have to deliver all the Argenta business?

A. With the exception of company material there would be four, but on company material there would be three.

Q. There would be three movements on that?

A. Yes, sir, three in one instance and two on the other.

Q. Leave out company material.

To illustrate that point take a grain house such as Mr. Bernstein's, who has a great many cars of grain coming into his house: suppose it came on the White River division from Newport and from there to the north?

A. Yes, sir.

Q. How many movements would that grain have to be delivered to Mr. Bernstein?

A. It would come in on the delivery track to the assigned track, say track number nine. The Valley yard assigned engine would come to track nine and pull it into the yard. He would assign it to track ten—that is the Bunch elevator accumulation track. Then he would take that from track 10 and deliver it to the Bunch elevator whenever they can receive it.

Q. That would make three movements on that?

A. No, sir, that would be four movements.

Q. I did not follow you, then, because I did not so understand you.

4174 A. There would be one movement from the train to the assigned track in the receiving yard; then a movement from the make-up track in the receiving yard to the Valley yard; that is two movements. Switching it from the assigned delivery track in the Valley yard to track 10 is three movements. And from track 10 to the Bunch Elevator is four movements.

We cannot get out of four movements to any industry in Little Rock with the exception of the movement of company material.

Q. Then all the grain that is handled in Little Rock receives four terminal movements?

A. Yes—well, I will make an exception to that. On grain received from the central division.

Q. You mean Fort Smith?

A. Yes. That would receive three movements.

Q. That will receive three if it goes to the Bunch Elevator?

A. Yes, sir.

Q. If it goes to Little Rock proper it will receive four movements?

A. Yes, sir.

Q. Where does the bulk of that grain come from, that is handled down there? Off what division does it come?

A. Change that question to "territory" and I will answer it, Judge.

Q. All right.

A. Then I cannot answer it correctly as to the amount.
4175 We receive both from the central division and the St. Louis and Illinois territory—I mean by that the Kansas territory and the Illinois territory and the Missouri territory.

Q. The point I am trying to get at is, is it brought into your yard over the central division or is it brought in there from the north?

A. Both ways.

Q. Which way is the bulk of it brought in?

A. It will very nearly equal itself, with probably a little exception in favor of the central division.

Q. Let us trace that grain movement a little bit further:

Suppose it comes in to the Bunch Elevator and is delivered to Bunch there. It has then received either three or four switching movements, depending upon from which division it reached there. Then when the Bunch Elevator Company ships out that car of grain, say to Malvern or some other point south of Little Rock, how many switching movements would there be on that?

A. The Bunch swich engine would go in and switch the elevator and throw it on a track there in the Valley yard. The Texas or south end engine, which is in the main yard, will come up and get that delivery and carry it to the south end of the yard. Now, he will switch that to an assigned track, local—what we term "local" or "through". If it is going to Arkadelphia, Hope, Gurdon, Benton or any of those local points, it has got to be made up in
4176 station order, each car represented by the station in the direction in which the train is moving. It may take twenty-five tracks to make up train 71, which is what we call our "short load" train out of there.

Q. It is your local?

A. No, not a local.

Q. It does local work in there?

A. It handles interstate cars on short local deliveries. That car would receive four movements and probably five or six before you would get it properly designated in the train, in its proper position for the train crew to set it out without any switching.

Q. Then tracing the history of a car of grain which has gone into the elevator there and then gone out to some local point, it has received altogether some eight or ten switching movements?

A. Yes, sir, eight or ten movements if it is properly handled as it should be and moves in the train in the rotation in which it ought to be.

Q. That is, more switching than for any other line of work you have?

A. The industrial work, yes. The industrial work as I stated in my evidence before—on any industrial cars the best we can expect would be seventy-five cars to the engine for ten hours; while
4177 a train line engine would handle from 350 to probably four or five hundred cars.

Q. Have you in mind cotton and grain when you speak of in-

dustrial shipments and also shipments delivered over at Little Rock to merchants?

A. Any commodities which go to the consignee's tracks in Little Rock.

Q. All cotton and grain goes to the consignee's tracks in Little Rock, doesn't it?

A. Not altogether.

Q. Take the cotton, it all goes there, doesn't it?

A. Not in all cases, no sir. We have compresses at other points outside of Little Rock which compress that cotton and then it goes to New Orleans and Galveston.

Q. Of course it would be compressed at other points such as Fort Smith, etc., but I am speaking of cotton that would not be compressed.

A. Of cotton compressed in transit?

Q. Little Rock is a milling-in-transit or a compress-in-transit point, is it not?

A. Yes, sir.

Q. And all of that would have at least four switching movements?

A. Yes, sir.

Q. Take the grain, all that comes through as milling-in-transit grain, coming through to Little Rock to be cleaned and then goes out again, all that would take eight or ten switching movements?

4178 A. It would take, as I have illustrated, four movements to get to the elevator, and out of the elevator it would depend on what its final destination would be. If it was a through car to Alexandria or New Orleans it would receive two movements out of the Bunch Elevator.

Now the same class of commodities out of the elevators in East Little Rock would require four movements to *to* get it into the assigned trains.

The same class would be indicated on stuff going south or west or north, it would take four movements.

It varies from two to four movements on through stuff and from two to, I will say, six movements on local stuff.

Q. You could not get two movements on local stuff, could you? That would come in from Kansas City and be shipped out to Pine Bluff?

A. From the elevator I am speaking of now.

Q. Now, let us get that a little clearer. As I understand you, it would take a minimum of three movements to get it into the elevator, and not less than four or more than six to get it out of the yards, depending on where the car is going: is that right?

A. That is correct.

Q. I believe you say on cotton, taking Little Rock as the concentrating point, there would uniformly be four movements: is that right or do you mean simply four on the illustration I put to you?

4179 A. The four movements are absolutely necessary and probably with a congested condition of the compress when they are not taking your cotton, we would make probably five or six movements with it.

Q. I understand that is true not only of cotton but everything else when congested conditions exist?

A. Normally it would be four movements.

Q. Would that be true where cotton would come in, whether from the central or any other division?

A. The compresses are so located that that is true. There is but one exception, and that is the Bunch elevator, on the movement of cars to and from industries.

Q. How about the Dickinson brick plant? How about the movement there?

A. The Dickinson brick plant is so situated that under normal conditions we move that business with four movements, but under adverse conditions it would require about sixteen.

Q. Four movements is the minimum?

A. Yes, four movements is the minimum on the movement of all business to Dickinson. And the same thing applies on the return business out of Mr. Dickinson's plant.

Q. Take cotton seed products: I don't know that I know where those mills are located. Are they in Argenta?

A. Some of them are in East Little Rock.

Q. How is the movement of cotton products, such as seed, oil, etc.

A. The movements are all just about the same. They are
4180 peculiarly situated. It is impossible to move a car from a train inbound to an industry without four movements of it, to any industry, with the exception of cars coming in off the central division going to the Bunch elevator. And then you cannot get them in there under two movements unless he is ready for them. Otherwise it will take from three to four movements to get them in. We have got to put them on the assigned tracks for the Bunch elevator and if he is waiting for them when the train arrives you can get them right into his elevator, but otherwise you must throw them on an assigned track.

Q. You have explained that fully.

Take cotton seed and cotton seed products: how many switching movements would it require to handle that class of traffic?

A. Ordinarily, four movements.

Q. That would be the minimum, four?

A. Yes, sir.

Q. How about lumber: are there any plants in Argenta or Little Rock taking a milling-in-transit rate on lumber?

A. I don't know of any at the present time.

Q. We are talking about 1907?

A. I do not recall any at that time.

Q. How about Mr. Abeles, did he not have a plant there?

A. Mr. Abeles had a plant there, but he was doing very little business at that time, if I remember correctly. The lumber
4181 business at Little Rock at that time and at the present was local out of Little Rock.

Q. There was a good deal of it local?

A. Yes, locally out of Little Rock, but the principal movement of lumber is through business.

Q. Do you have an icing station there at Little Rock for these through refrigerator cars?

A. Yes, sir.

Q. What is the movement on that so far as switching is concerned from the train to the icing plant and from the icing plant back to the train? How many movements would that require ordinarily?

A. If it is necessary to throw the car to an assigned track——

Mr. MOORE: Take the ordinary course. That is what he wants.

A. Ordinarily the minimum is two and the maximum is three.

Mr. HILL:

Q. There would be two to three switching movements on that?

A. Yes, sir.

Q. You have a cattle feeding station there, haven't you?

A. Yes, sir.

Q. Do all the cattle stop there?

A. Yes, sir.

Q. What is the switching movement on that?

A. The same applies to the cattle.

4182 Q. Two or three movements on all of it?

A. Yes, sir.

Q. Are there any implement transfer houses there where a car is taken into the implement house, filled and then sent on?

A. There are wholesale houses there that handle everything—commission houses.

Q. Say take the John Deere Plow Company stuff: that comes down there into one of those houses and that same car is taken out, the same as you take a car out of an elevator?

A. They have an agent and those cars coming in there go to the John Deere Plow Company or agent. That agent unloads it and then ships them out locally or distributes them.

Q. That comes out in carloads a good deal, does it not, the same as it comes in?

A. I can't recall any such instance.

Q. I know they do up our way with some of those large concerns.

A. They have too many agents through Arkansas at local points to justify carload lots.

Q. That is done at other places to your knowledge, is it not?

A. Yes, sir.

Q. You don't recall any considerable movement of that kind at Little Rock?

A. No, sir.

Q. What place have you in mind where that kind of handling is had?

A. Well, Cairo, Illinois, for instance.

4183 Q. Is not Oklahoma City a very striking example of it?

A. Yes, sir, and Springfield, Missouri, and St. Louis, Missouri, for instance. I can't recall any place in Arkansas.

Q. There is some of it in Fort Smith, I know.

A. There are wholesale houses there and lots of implement agents, but I can't recall that kind of shipment.

Q. We will not dwell on that if you don't know.

You were telling us that in times of congestion you would load up the local freight trains with through traffic: that would give the through cars a great deal of extra yard handling at various terminals in the state, would it not?

I will illustrate what I mean, if you do not quite understand: suppose you have more cars there in the Hoxie yard than you could carry off in your trains, there being congestion there: you would load them up and take them down on the local train to Little Rock and then carry them out of Little Rock on the through train:

Is that the way you handle it in times of congestion?

A. Yes, sir, we add such tonnage to the local trains as would be justified in the handling of our business.

Q. That would give extra handling to all such through stuff as was added to the local trains and then carried to another station and put in the through train: does not that give extra yard movement?

A. It would give extra yard movement against that which would come in in solid trains.

4184 Q. That is what I am speaking of. You were talking about carrying these through in solid trains, but in times of congestion you would load this on the local trains and that would give extra handling to the cars you added to the local trains as compared with what they would receive if they had been carried on through trains, would it not?

A. Yes, sir.

Redirect examination.

By Mr. MOORE:

Q. From your experience in handling cars at the Little Rock terminals, do these consist sheets which you filed as your Exhibit 53, speaking independently of the consists, show the order and arrangement and conditions with reference to the engines that the cars on the through trains usually come into the terminals?

A. Yes, and in such exceptions as are made the conductor makes a note on his switch list, which is the consist.

Q. What I mean to ask you is, did you look over the consists you filed here, these thirty-one sheets?

A. Yes, sir.

Q. And is it your experience and observation from handling cars at that terminal, that they are correct?

A. Yes, sir.

Q. You were asked on cross-examination if there was congestion in March, 1908: was there not a heavy movement of empties in 1908 that had the effect of obstructing the movement of

4185 trains?

A. There was a heavy movement of both empties and loads.

Q. Did that have any obstructive effect on the movement of through trains in the state of Arkansas?

A. Yes, sir, the return movement of empties after the orders had been filled for the delivery—an empty would onstruct just as much as a load.

Q. The Texas railroads were sending back cars during that period?

A. All connecting lines were delivering back for home delivery all classes of empties.

Q. You spoke of a good deal of cotton being brought in October, 1908, on the pick-up trains, compressed at Little Rock.

What is a pick-up train?

A. What we term a "pick-up" train is one made up at Little Rock to start back and pick up all the cotton loaded on that territory during that day, for Little Rock compressing.

Q. Does most of the grain that comes into and passes through Little Rock come in on the central division or over the main line—or did it in 1907?

A. Well, I am not in a position to state positively as to the correct amount or the division of the same. We received grain from Memphis, St. Louis and Kansas City, Memphis and St. Louis grain coming over the main line and the Kansas City grain coming over the central division.

Q. I want to see if I understand you correctly in regard to the switching service required by grain: you spoke about the
4186 reshipment of grain that went through the elevators at Little Rock: that grain would be shipped out, some on the Valley Line and some on the main line south, you say: now, what is the difference in the switching that is required for the grain that was shipped out on the Valley line to Pine Bluff, and points in that direction, and that shipped out to points on the main line?

4187 A. That would be two to one. Two movements on the main line to one movement on the Valley Line to the Bunch Elevator. I explained that is made on the Bunch Elevator.

Q. And grain coming out on the Valley Line would not receive the amount of switching that that going out on the main line would?

A. No, sir, because the Bunch Elevator is located in the Valley Yard. We have solid trains of grain from Texas.

Q. There is a good deal of local movement from the industries to points out in the State, shipping brick and commodities of that sort to industries?

A. Yes.

Q. Will you state the entire movement in consigning from the Dickinson brick plant, say to be shipped out into the State, beginning with the movement of the car out to the plant for the purpose of being loaded. That would be the first movement, wouldn't it?

A. The first movement is to accumulate the cars and assign them to the tracks for Dickinson.

Q. In order to do that you would have to switch them out to the plant?

A. Wait a moment. I am in the make-up yard where the cars

would be accumulated as they come in to go to the Dickinson plant. From the time they reach Little Rock they are assigned and carded showing the final destination as the Dickinson brick plant.

4188 Q. That would be an empty car?

A. Yes, sir, that would be an empty car. It is drawn in on a track known as the track assigned to Dickinson. The engine then will take that car, after switching it into this track, and the transfer engine will take it to the Little Rock Union Depot. Then the Union Depot engine will take it from there to Dickinson's plant and set it in on the assigned tracks there to load the brick.

Q. Then it is left there?

A. Yes, sir, it is left there.

Q. And the engine comes back?

A. Yes, sir.

Q. Then what?

A. Then when it is loaded the billing is received from the plant for it and an engine goes out and gets it and brings it in to East Little Rock, and at East Little Rock it is switched to go wherever the cars are consigned, to the levee, or out on the road, if a Line car; and them the transfer engine gets hold of it and brings it to the Argenta train yard. Then the train yard engine gets hold of it and switches it into the train and it goes on. Four or five or six moves is the best you can get out of it.

Q. How many movements would it involve, the switching movement you have given?

A. Four to the plant and five back getting it into the train.

4189 Recross-examination.

By Mr. HILL:

Q. There is one other class of interstate shipments that I want to ask you about and that is oil: how is oil, coal oil, or kerosene handled?

A. You mean relative to the amount of switching it receives?

Q. Yes, I am on the switching proposition now.

A. It would receive the same switching as any other commodity assigned to the various different industries.

Q. It would receive the same switching that you have heretofore explained about industry switching?

A. Yes, sir. There would be no exception as to oil, with the exception of its explosive position in the train in which we send it out. We might have to make extra switches in order to get that into the train as prescribed by our explosive instructions.

Q. Doesn't that make more switching?

A. Yes, sir, that makes more switching.

Q. In an ordinary normal movement of the oil cars how many switch movements would there be on it there at Little Rock?

A. The same as I have illustrated that applies to industrial switching, with the exception of placing it properly in the train, ten cars from the rear or fifteen cars from the head end of

4190 train.

We have got to accumulate that oil on a certain track

and get a sufficient number of cars to cover the oil from the engine and then cut it in.

Q. That would be the same when the train is made up at Hoxie?

A. It applies at any division point or any intermediate point where oil is moved in the train. There is a statute which covers its position in the train.

Q. I understand about its position but I do not know how you work that out. How many extra switching movements would it take to comply with that statute?

A. It is a normal switching movement to accumulate that oil in the track, just plus another movement to cut it into a train of cars.

Q. There would be normally 5 movements on the oil car?

A. Yes, four to the industries and five out of the industries to the train.

Q. Seven altogether?

A. No, sir, there would be four movements to the industries and five movements out of the industries to the trains moving out of the terminals. That is, you would have to hold the oil out separately on a track all to itself, and fill up your train, and then pick up a sufficient number of cars to cover that oil car's position in the train and then pick up your oil and set it back in the train,

4191 covering the cars from your engine.

Q. You send out those oil trains about twice a week: isn't that the rule?

A. We sent oil out of Little Rock as it accumulates. There is no oil except cotton seed oil and there is no coal oil except such as is shipped locally.

Q. Those are small shipments, less than car load?

A. Yes, we have small shipments of less than car load, twice a week to local points North and South and East and West.

Q. Now, how about the return of the tank cars?

A. Empty?

Q. They have to go back empty. They are not like other cars?

A. They are placed in the train without any respect to their position, unless they have been loaded with certain classes of oil, nitro or gasoline or any explosive, when the gas might accumulate in the empty car. Then those cars are carded showing what commodity they were loaded with, and then they must be switched back, and as much respect is shown those cars as if they were loaded.

Q. That is an empty movement back always on those tank cars?

A. Yes, sir.

4192 Redirect examination.

By Mr. MOORE:

Q. You were discussing a while ago the switching movement of those grain cars to get the grain to and from the elevator: those cars handled in that way are usually moved in large blocks or groups, aren't they—that is, a large number of cars, a large cut of cars?

A. Consigned to the elevator?

Q. Yes.

A. We may have a solid train of grain coming in to the Bunch elevator. We may have a solid train coming in from New Orleans.

Q. And those would all be moved in one cut?

A. Yes, sir.

Q. And one switching service would frequently move twenty to thirty cars?

A. Yes, if they all came in, accumulated.

Q. Don't they always come in in a large number of cars?

A. Yes, sir, they usually come in in solid trains.

Q. How is it about the cattle cars that you bring to the yards to feed? They come in in groups, too, don't they?

A. Yes, stock is usually covered by four or five cars of dead freight from the head end.

Q. They are moved in one cut?

A. Yes, sir.

Q. Just one switching movement is required for all those cars?

4193 A. Yes, sir.

Q. Is that true about the icing plant?

A. Yes, sir, to and from the icing plant. And to the stock yards and from the stock yards to the train.

Q. And there is very little switching of the individual cars; it is switching that applies to these large groups of cars?

A. Yes, sir.

Q. And that class of business moves on these heavy through trains, doesn't it, both the grain and the stock?

A. Yes, sir, grain and stock. In all cases they are high class trains.

Recross-examination.

By Mr. HILL:

Q. Let me see if I understand that cattle business: those cattle have to be unloaded, don't they?

A. Yes, sir.

Q. And reloaded?

A. Yes, sir.

Q. Each individual car has to be "spotted" to the chute to be unloaded, and to be reloaded?

A. Yes, sir.

Q. And whether uncoupled or not each car has to be "spotted" to the chute?

A. They have five chutes and we can spot five cars at a time. The chutes are so constructed that when you spot one car you spot the five.

Q. But you could not spot fifty?

A. No, sir.

Q. How about the ice house?

4194 A. The ice house holds five cars.

Q. It is a five car capacity house?

A. Yes, sir.

Q. How many cars can you put on the Bunch elevator tracks down there?

A. We can put twenty-five cars. We could put thirty but he cannot drag any more than twenty-five.

Q. He has a winch on there?

A. Yes. We can put twenty-five cars on there.

Redirect examination.

By Mr. MOORE:

Q. Is it as expensive to spot those cattle cars for the purpose of reaching the chutes as it is for moving a car ordinarily, say to an industry? That is, where those cars come together?

A. Taking into consideration the distance necessary, it does not cost you as much to move your engine three or four car lengths as it would to move it half a mile.

Q. You can spot five cars at a time at the chutes?

A. Yes, sir, five at a time.

Q. There would not be any comparison in the switching expense, on the two services, would there?

A. No, sir, the only thing you would figure there is the amount of time consumed in loading the stock.

4195 JOHN CANNON, a witness of lawful age, being duly produced, sworn and examined on the part of the complainants, testified as follows in rebuttal:

Direct examination.

By Mr. MOORE:

Q. State your name, residence and occupation?

A. John Cannon; Desoto, Missouri; Superintendent of the St. Louis, Iron Mountain & Southern Railway Company, Missouri Division.

Q. What were you doing in 1907?

A. From June 1, 1907 the balance of the year I was superintendent of the Arkansas Division of the St. Louis, Iron Mountain & Southern Railway with headquarters at Little Rock, Arkansas.

Q. Your headquarters were at Little Rock?

A. Yes, sir.

Q. You were in Little Rock, then, during Oct. 1907?

A. Yes, sir, I was superintendent of that division.

Q. Do you know how the consist sheets there were introduced in evidence here yesterday while Mr. Moore was on the stand, being Complainant's Exhibit 53, were made up?

A. Yes, sir.

4196 Q. Please state how they are made up?

A. On the arrival of a train at Little Rock the conductor hands in to the yard office a switch list, giving the numbers of the cars in his train as they stand.

Q. You mean the order in which they stand?

A. Yes, sir. With this switch list is all of the waybills that he

brings in with his train. This switch list is checked against the waybills and then the cars are written up in train order in one of the "in-bound" books and from this book record the consists produced here yesterday was copied.

Q. Barring some clerical error that might creep in, those consists show the order in which the cars came into the terminal, do they?

A. Yes, sir.

Q. I hand you sheet one of Exhibit No. 52 filed by Mr. Aumocek, which shows the consist of a train into Hoxie and out of Hoxie on Oct. 1, 1907: State if you are sufficiently acquainted with the manner of handling cars at terminal stations to state how such consist as shown on this sheet would be handled with regard to the switching service?

A. Yes, I am sufficiently familiar with that to answer.

Q. Will you state, taking the Hoxie train there how the cars in that train are handled by the switch engine and what service is rendered to the different classes of cars and what service to the individual cars and to the groups of cars?

4197 A. 49 cars shown as arriving at Hoxie at 3:35 P. M. October 1, 1907 in train second 71 were handled out of that station on train 55, all but seven of them.

The ordinary manner of handling the train in Hoxie would be to pull it in on one of the receiving tracks and the "bad order" cars and cars for local points between Hoxie and Little Rock would be cut out. Ordinarily there would not be to exceed two or three switches to accomplish this. The bulk of the cars would be received on a track and go forward from that same track.

Q. There is a group of 11 cars at the top that went right through from Hoxie to Little Rock. Two were taken out. Then there is a second group of five cars, and a car or two taken out. And then there is a group of 20 or 25 cars that go on to Little Rock: was there any switching done to that first group of 11 cars I spoke of?

A. No, sir.

Q. The first thing would be to take off that top car, which it seems was cut out at Hoxie?

A. Yes, sir.

Q. And then the next two cars the sheet shows were cut out two switches, I suppose?

A. They would get off down here (indicating on sheet) and pull that whole cut out, and "kick" this car (indicating) in and kick that out (indicating) back on the train, and kick these (indicating) back on the train, and then kick these two out (indicating). There would be about three moves in there.

4198 Q. And those moves were for the purpose of getting the cars out that would be left at Hoxie?

A. Yes, sir.

Q. The last batch of cars there, 25 cars, would they receive any handling at all?

A. No, sir.

Q. You stated in describing the movement here that certain cars

would be kicked out: you mean the cars that were left at Hoxie would be kicked out?

A. Yes, sir, the cars that would be set out at Hoxie.

Q. Those are the cars you referred to when you said "this car" and "that car" would be kicked out?

A. Yes, sir.

Q. Mr. W. B. Moore who testified yesterday in this case referred to pickup trains that were sent out to bring in cotton to compress points: what are those trains? Just describe what class of trains they are?

A. These are trains we run nearly every day during the entire year, and during the cotton season in Arkansas, there are two or three run every day. We call a through freight crew—for instance he is going up the central division—or I will confine myself to my own terminal.

Q. No, describe it just as it was in Arkansas in 1907?

A. That was my territory in 1907.

Q. That is what you mean by your own territory?

A. Yes, sir.

4199 Q. Proceed.

A. Take a train going out of Little Rock down toward Texarkana: we would start him out with loads destined to stations between Texarkana and Gurdeon and empties for cotton loading. He would distribute those empties where needed and would set out the loads.

He would turn at Gurdeon and he would pick up the cotton that had been loaded during the day, and he would get a train possibly in five or six stations.

Then he pulls that train into Little Rock. That is a through freight train, as we look upon it; that is, as the Operating Department looks upon it. We pay them full through freight pay and they are not regarded as local in any sense of the word.

Q. Are they through scheduled trains?

A. They are not scheduled trains at all, but are "extra" trains, handled by the train dispatcher, and are not on the time card.

Q. Is a good deal of the cotton that is brought into the concentrated or compressing points picked up by these pickup trains through the State of Arkansas?

A. During the height of the season, yes.

Q. Mr. Moore testified yesterday in regard to the congested condition that existed in the State of Arkansas in October, 1907: I wish you would state what effect the conditions he described had upon the movement of freight on the two classes of trains, the through trains and the local trains: whether it created any accession

4200 to the loading of either of those classes of trains, and if so what?

A. During the Fall of 1907, on account of the very heavy movement of business, we departed from our usual practice in loading our local trains. The local trains during normal times handled nothing but less than carload freight and what we call "short loads"; that is, loads destined to stations on the local train territory.

During the Fall of 1907, in addition to that class of loading the locals were filled up to nearly the maximum tonnage with throught loads, loads that went an entire distance over the district the local was run on. That excess tonnage ran all the way from 300 to 800 tons per day.

Q. You said 300 to 800 tons: do you mean gross tons or net tons?

A. When I speak of tons I always have reference to gross tons, as an operating man never treats of anything else but gross tons, the car and the load together.

Q. What was usually the character of that excess tonnage? Was it freight that originated in Arkansas or that came into the state from other states and then went out? Did this freight come from Missouri, was it through freight coming from other states or was it freight that originated in Arkansas?

A. Most of it was interstate traffic. Of course, there was a lot of state traffic handled also. But the major part of it was interstate freight, through loads that were ordinarily handled in our through trains, going to St. Louis or Memphis and to points in Texas
4201 or Louisiana.

Q. What would you estimate was the proportion or per cent of interstate freight carried on local trains during the period mentioned, that is, the month of October, 1907?

A. In my opinion our local trains handled approximately 75% interstate freight during that period, October, 1907.

Q. What would be the proportion in ordinary times, when conditions were normal in the movement and handling of traffic? What would be the proportion then of state and interstate freight carried on local trains?

A. During normal times the interstate traffic on local trains does not amount to but 25%, because we did not handle any through loads on locals during normal times.

Q. The conditions would be reversed then?

A. Yes, sir, practically . ersed.

Cross-examination.

By Mr. HILL:

Q. Mr. Cannon, where did you get your information to make this estimates you have just given about October, 1907, that 75% of the traffic on the local train was interstate and at other times it was about 25%?

A. From personal observation, riding over the road on the trains, looking over the reports and the consists, of the trains.

Q. You have no statistics on the subject?

A. None whatever.

Q. It is just your personal opinion?
4202 A. That is all.

Q. That would require scrutiny of the waybills in order to form an opinion of that kind?

A. The destination of the cars gives you the same information.

Q. That is true. You get that from the waybills or some other source?

A. It is compiled from the waybills. The reports I would see would be the conductor's reports, the consists and so on.

Q. Have you, before this case came up, had any occasion to study the problem of how much interstate traffic and how much intrastate traffic would be carried on the separate classes of trains?

A. I never made any particular study of it, no, sir.

Q. In operating a railroad you do not pay any attention to state or interstate, do you?

A. I base my conclusion as to the proportion of state and interstate freight upon the fact that during the Fall of 1907 our local trains were all loaded practically to the maximum tonnage of the engines and the only way we could load those engines to that maximum tonnage would be in handling interstate freight.

Q. That is not an answer to my question. It is a very good reason for your opinion but I called for another answer.

A. I guess I don't understand the question.

Previous question is read to the witness as follows:

4203 —. In operating a railroad you do not pay any attention to state or interstate, do you?

A. No particular attention to it, but an observant man can always tell, and always knows, where his freight is going, the destination of his freight. He comes in contact with that every time he hits his office and every time he gets on a train.

Q. The thing you look at is the operation of the local trains and of the through train, isn't it?

A. That is what my reply specifically referred to.

Q. That is the way an operating man looks at it, isn't it, from the standpoint of a local train or the standpoint of a through train?

A. Why, of course, and you know where your freight is going.

Q. Of course, it makes no difference to you whether it crosses the state line?

A. No, sir, none whatever.

Q. The question is whether that freight is going on a local or going on a through freight train, not whether it crosses the line of Arkansas or Missouri?

A. The only question with me is to get my train loaded and moved on and off my division as quickly as possible.

Q. Your problem is not about the state line?

A. It does not have any reference to the operation of my railroad at all. But I always know all about that, of course. That
4204 is, anybody who keeps his eyes open, he cannot help knowing it.

Q. If he wants to make a study of it, and he studies it, he has a good opportunity to inform himself?

A. Every opportunity in the world, because under normal conditions you know your local train is on there to handle less than carload freight, and short loads, and normally there should not be any interstate freight on it, unless your local is scheduled to cross the

state line. When I was in Arkansas I had no trains that crossed the lines.

Q. No local trains, you mean?

A. No local trains that crossed the line. In fact, I had no trains that crossed the line.

Q. You send trains to Memphis, don't you, that cross the line?

A. My junction was Bald Knob.

Q. It takes both origin and destination, to know whether freight is state or interstate, does it not?

A. Yes, sir.

Q. You would have to have something more than the conductor's reports, wouldn't you?

A. Not necessarily.

Q. I am not speaking of necessarily, but I am speaking of usually.

A. I say no, sir.

Q. Where would you get the information as to the origin?

4205 A. For instance—Well, I would not always get it.

Q. I suppose not.

A. But I would know the car was destined to a point in Louisiana and in moving in Arkansas it must necessarily be interstate freight. Or if it was billed to Missouri or billed to Texas or billed to Kansas, if I handled it at all on my Arkansas Division I would know it was not state freight, because it crosses the state line. Of course, I would not know whether that car originated in Missouri or in Arkansas.

Q. You take a car destined to a point in Arkansas that would come on your division at Little Rock, and you would not know whether that was state or interstate, would you?

A. Not unless I looked at the waybill.

Q. It was not your business to look at the way-bill, was it?

A. No, sir, that was not a specified duty of mine.

Q. This sheet No. 1 that you have been testifying about, in Exhibit 52, is that made up from the wheel reports?

A. I don't know. My opinion, from the fact that it was compiled in St. Louis, is that it was made up from the wheel reports.

Q. Would this give the order of the cars in the trains?

A. Yes, sir.

Q. Would the wheel reports give the order of the cars in the train?

A. As a rule it does. There is an exception. On local trains, it does not.

4206 Q. But as a rule the wheel report does give the order in which the cars are set in the train?

A. Yes, sir.

Mr. MOORE:

Q. Do you mean on both classes of trains or only one class?

A. On the through trains.

Mr. HILL:

Q. You assume this was made from the wheel report and that the wheel reports give the order of the cars in the train, when you made your answers to Mr. Moore's questions about it?

A. Yes, sir.

Redirect examination.

By Mr. MOORE:

Q. Mr. Cannon, Judge Hill asked you if you had seen statistics here in regard to the percentages of state and interstate freight cars on local trains: I want you to state if you have seen or if you have been informed as to the result of any statistics as to the percents or proportions——

Mr. HILL: Excuse me, Mr. Moore, but I asked him if he had prepared any statistics.

Mr. MOORE:

Q. Have you seen or been informed of the result of any statistics in this case whatever, showing the proportion of state and interstate freight hauled on local trains?

A. No, sir, not in this case nor have I noticed them in recent years at all. I haven't had time.

4207 Q. Your opinion is based on your observation?

A. Absolutely my own personal observation from going over the road.

Mr. HILL: You misunderstood me. I asked him if he had prepared statistics or was answering from personal observation and he answered it was from personal observation.

Mr. MOORE:

Q. Counsel asked you if you knew the sources from which this sheet one of Exhibit 52 was compiled and if the wheel report would show the order of the cars in the trains; independent of any knowledge or impression you may have as to how this consist was made up, I want you to state what the rules and what the instructions are, if any, which have been issued in regard to making up trains at these terminal stations in reference to the order in which the cars that are to go through from one terminal point to another, or to go through from a terminal station to another state on a through train, are to be arranged?

A. A through train starting out of St. Louis is made up of all of the Texas loads switched together; all the Arkansas loads switched together; and all the Louisiana loads switched together. The short loads for points on the first district out of St. Louis are arranged in station order. Those that are set out at Poplar Bluff are put together.

Now we run what we call train 55 (that is a Texas train) filled out with Arkansas and Louisiana freight. All the Texas loads in

4208 that train—as a rule it is a solid Texas train—but if there is not enough tonnage of Texas freight we add on what we call Arkansas and Louisiana cars. There may be five Arkansas cars and five Louisiana cars. They are cut out at Little Rock.

Then we run what we call train No. 75: that is an Arkansas and Louisiana train and those cars are bunched.

So the train passing through Piedmont receives the minimum amount of switching to cut an engine off and put another one on,

cut out the caboose and put on a caboose, and cut out any "bad orders." Or, if there happens to be a Piedmont load on the rear or on the front end of that train, we cut that out.

The same thing is done at Hoxie and the same thing is done at Little Rock.

Q. As I understand you, that is the order they attempt to provide for as nearly as they can, always?

A. That is the usual order.

Q. This sheet 1 of Exhibit 52 illustrates the statement made by you as to the manner of making up these through trains?

A. No, sir, there is no destination shown on Sheet 1.

Q. Take sheet two covering October 7, 1907 of Exhibit 53, which is the consist of a train, and state if that illustrates it?

A. (After examining paper.) Yes, sir.

Q. Most of that work is done at the inspection yard at Dupo, isn't it?

4209 A. For the train coming down on the east side, yes. At Lesperance for trains coming down from St. Louis.

Recross-examination.

By Mr. HILL:

Q. Mr. Cannon, I believe you say you class these "pickup" as through trains and pay the wages of through trains to the crews on them?

A. Yes, sir.

Q. Those pick-up trains handle most of the cotton traffic in the state of Arkansas?

A. Yes, sir.

Q. I mean into the compress?

A. Yes, sir.

Q. And how do you handle it after you get it out of the compress?

A. It is made up into through trains at the cotton compress.

Q. The cotton is handled largely on through trains from the time it starts to moving until it gets out of the state?

A. The biggest portion of the cotton is so handled, yes. Of course, local trains handle all they can.

Q. Local trains handle some cotton, I presume?

A. They handle a great deal of cotton.

Q. But the bulk of it is handled on the pick-up trains, as I understand you?

A. Yes, sir.

4210 Q. You referred to the heavy traffic in October, 1907: I will ask you if in your judgment the ton mileage in October, 1907, was much more than the ton mileage of any other month in that six months period ending December 31, 1907: I mean ton miles of freight. I do not mean the car ton miles as you referred to but with the weight of the cars included. I am getting to the proposition of the handling of freight.

A. You are talking about net tons.

Q. I don't know your term, but I am talking about moving freight miles: that is the idea I have got.

A. I cannot answer that question because I cannot think any net tons. All we figure on in operating a railroad is the gross tonnage. That is what we have to haul with our engines; and that is made up of the car and the load, too.

Q. Your problem is—everything right behind the engine?

A. Yes, sir, everything.

Q. That is what you look at as your factor, to see what you can have that engine haul?

A. I have got to have that engine pull everything she will haul. It may be loads and it may be empties.

4211 H. V. BROWN, a witness of lawful age, being duly produced, sworn and examined on the part of the complainants in rebuttal, testified as follows:

Direct examination

By Mr. MOORE:

Q. State your name?

A. H. V. Brown.

Q. Where do you live and what is your occupation?

A. I live in Little Rock. My present occupation is Assistant Yard Master of the St. Louis Iron Mountain & Southern Railway.

Q. What was your occupation in the Fall of 1907?

A. I was known as Terminal Clerk in the Little Rock terminals, performing the duties usually assigned to a division agent.

Q. Do you know how these consist sheets that have been introduced in evidence here, (Complainants' Exhibit 52) were made up?

A. Those yellow sheets, you mean?

Q. Yes.

A. Those sheets were made up from the inbound train book. The record on the inbound train book is made by what is known as the "desk clerk," from the waybills after being checked against the switch list, in order that he may see that he has a waybill for each car shown on his switch list.

4212 Q. What is a switch list?

A. A switch list is a list of the trains that is made out and handed into the office by the conductor, showing the initial, the number, the contents, and the destination of each car in his train and as they stand in train order.

Q. The switch list shows the order of the cars in the train?

A. Yes, sir, it shows the order of the cars in the train.

Q. And that is handed by the conductor to whom?

A. That is handed by the conductor to what is known as the inbound desk clerk.

Q. I suppose the desk clerk then compares the waybills, which is really the contents of the train, with the switch list for the purpose of seeing that all the cars enumerated in the switch list are covered by waybills—or vice versa. That is to verify and balance the two?

A. His first duty is to check the waybill against the switch list

to see that he has a waybill covering each car shown on the switch list.

Q. How are the cars usually arranged in these through trains, say train 55, this through redball train, with reference to their destination?

A. Train No. 55 is known as our Texas train and frequently consists of a solid train of through freight.

Q. Is anything done to that train other than what it may require if there are any bad order cars in it, except changing the
4213 engine and that sort of thing—is there any switching service rendered to it?

A. If they have sufficient tonnage into the Little Rock terminal and no deductions are to be made from the inbound train, there is nothing done to the train except to change the engines and caboose, providing there are no "bad orders."

Q. Now, come back to the question I asked you before: what, usually, is the order that the cars stand in with reference to their destination, on that class of trains. I speak of Train No. 55 merely to illustrate?

A. The through cars are all en bloc, that is, they are all switched in one operation of the train.

Q. What is that done for?

A. That is done to save switching at the various terminals.

Q. You spoke a while ago about making additions: now I want you to state whether you have any information before the train reaches Little Rock as to what this consist is, and if anything is done with reference to putting other cars on that train: if there is any practice of that sort, describe it?

A. We receive the consist of these trains from a conductor frequently before they get very far out of Hoxie.

Q. How do you get that?

A. We get that by telegraph.

4214 Q. That simply consists of information as to the cars and their destination? Of course, it does not tell what order they are in on the train, I imagine?

A. Yes, sir, it tells the order. It gives all the information that is given on the switch list outside the initials and car numbers.

Q. What do you do when you get that information?

A. If No. 55 has not sufficient tonnage into Little Rock, as shown by the consist we receive by wire, we arrange sufficient freight to fill it out.

Q. That is all done when the train gets in?

A. When it is possible. It is usually done before the arrival of the train.

Q. It is your effort to do it in that way?

A. Yes, sir.

Q. Mr. Brown, you say the Texas cars, say the cars going through to Texas, are grouped together on this through train, say No. 55, if you should have additions to make to the train in order to fill out its tonnage, will the cars which you say are grouped together, require any switching?

A. That is what we would term "a fill out".

Q. How is that done. Describe that.

A. That would be either set on the hind end of the train after putting on the caboose——

Q. You mean the additional cars?

A. Yes, sir, the additional cars. Or they would be placed
4215 on the head end of the train as the inbound engine is removed, as conditions will permit. In some instances it is handier to put them on the hind end of the train with the caboose and in other cases the cars might be so located that it would be quicker to put them on the front end of the train.

Q. Would the cars that come in be put on the hind end, or would they stand there until the train was ready?

A. They would be received and handled off the same track, and wihout any extra handling, barring bad orders; that is those cars going through to Texas.

Q. It *has* been suggested in this case that there was a congestion in the yards at Little Rock in October, 1907: did that congestion have any effect in increasing the loading of either through or local trains?

A. It increased the tonnage on the local freights. Our through freights were carrying full tonnage all the time.

Q. The through freights were carrying full tonnage all the time but it increased the tonnage on the local trains?

A. Yes, sir.

Q. Of what kind of tonnage did this additional freight added to the local trains consist? Was it local freight confined to the state, or was it freight that came from other states?

A. It was some of both. In many instances we would give the locals short loads and also fill them out with through loads,
4216 destined to the next terminal yard.

Q. Which preponderated? Which had the larger proportion, the through or the locals, that were added to the local train?

A. Judge Moore, I could not answer that question. I would not know how to apportion that.

Q. During that period, October, 1907, what proportion of the tonnage that was carried by the local train would be interstate and what proportion would be state?

Mr. HILL: I think before doing that you should lay some foundation for his competency.

Mr. MOORE:

Q. What did you as yard clerk have to do, if anything, with the handling of those cars, that would give you information on that subject?

A. I handled the waybills every day. I went through the waybills and checked up the local situation in the yard and made reports daily as to the movement of freights in and out of the yard. It gave me a pretty good idea as to what we were handling.

Q. That gave you the means of knowing what kind of freights were handled on the local trains, didn't it?

A. I should say so, yes, sir. I think I was in a position to know as well along those lines as anyone who would be in the terminals, who was not preparing statistics.

Q. I will change my question: I asked you a while ago as to the conditions during this period of congestion. Now leave that
4217 out. But in ordinary times when the movement is your ordinary and usual movement, what proportion or percent of the freight hauled on local trains would be state freight and what proportion would be interstate freight: just give your idea and your best judgment about that?

A. I think the locals in normal times handle at least 70% of the state freight; and not to exceed 30% of interstate freight.

Q. What were the proportions handled during that congested period you spoke of when the additions were made to the local trains?

A. The proportion of interstate freight was increased considerably on account of the through loads that were being put on the local in order to facilitate the movement of the cars.

Q. What proportion of the freight carried on local trains would be interstate, during the congested period, say October, 1907?

A. I should estimate it was upward of 60%.

Q. You say you handle all the waybills and that gave you a means of knowing what the freights were that were carried on the trains?

A. Yes, sir, I checked the waybill every day. That was a part of my duties.

Cross-examination.

By Mr. HILL:

Q. Is much freight passing in and out of Little Rock
4218 from Fort Smith?

A. At the present time?

Q. No, we are talking about 1907, now.

A. From Little Rock to Fort Smith?

Q. I include Fort Smith and the mines, say the Jenny Lind mine, that passes through Fort Smith?

A. Inbound?

Q. Both ways.

A. Yes, sir, there was a heavy movement both ways and especially coming to us at Little Rock.

Q. Of what did that principally consist?

A. It consisted of coal, and there was a heavy movement of grain at that time, and there was a heavy movement of cotton from local stations. Of course, the cotton did not come to us from as far west as Fort Smith.

Q. I am talking about the movement that originated in Arkansas and passed through Fort Smith, like from the Jenny Lind mine, and furniture and manufactured articles from Fort Smith: wasn't there a considerable movement of that kind?

A. Through Fort Smith?

Q. No, from Fort Smith to Little Rock.

A. We did not get much merchandise from Fort Smith. But there is always a good movement of coal and it was especially heavy at that time.

Q. October, 1907?

A. Yes, sir.

4219 Q. Coming from the Jenny Lind mine?

A. Coming from mines up there. I am not sufficiently well acquainted with those mines to say whether it was all from the Jenny Lind.

Q. It was coal originating at different points in Arkansas and it came through Fort Smith to Little Rock?

**A. Yes, sir.**

Q. There is a great deal of furniture and things of that kind manufactured in Fort Smith that comes through to Little Rock?

A. I do not have any recollection of handling furniture and manufactured products manufactured at Fort Smith.

Q. There is considerable traffic between the two towns?

A. Yes, sir, it is heavy.

Q. Was it especially heavy in 1907?

A. Yes, sir.

Q. And in October, 1907?

A. Yes, sir.

Q. In discussing state and interstate freight here, a few moments ago, how did you treat that traffic from Fort Smith? Was that state or interstate freight?

A. To Fort Smith?

Q. Yes, to Fort Smith and from Fort Smith to Little Rock.

A. That would be treated as state freight, in my estimation.

4220 Q. You say you saw the waybills in October, 1907, and from the waybills you formed an estimate as to the amount of state and interstate freight: was it your business to study from those waybills whether the freight was state or interstate?

A. No, sir, it was not.

Q. That was just casually before you; it was no part of your business to study out that problem at all, was it?

A. No, sir.

Q. What use did you make of those waybills? What was your business with them?

A. The yard was in a congested condition and it was my duty to check the waybills each day to see the condition of the old loads—principally to keep a check on the old loads and so far as possible remove the oldest loads in the yard. Also to check the waybills and see that we had a car for each waybill in the yard, and the location of that car.

Q. It did not make any difference, so far as your duties were concerned, whether that was state or interstate freight?

A. None whatever.

Q. Your attention was not called to whether it was state or interstate?

A. No, sir.

Q. It was simply a question of what car should go out and how it checked up with the reports you had?

A. Yes, sir.

4221 Q. You saw the waybills on only four locals, did you not?

A. That is all the locals we had out of there, a local each way.

Q. That was the extent of your observation of the waybills on the local trains running in Arkansas in October, 1907?

A. Yes, sir.

Q. How would you determine from a waybill whether the freight covered by it was state or interstate freight?

A. By the destination or by the point of origin.

Q. You would have to have it before you, would you not?

A. Yes, sir. If you have a waybill before you, you have both.

Q. You would have to look at both columns, you would have to look at the point of destination and the point of origin, and the consignee and the consignor, in order to determine whether that was state or interstate freight?

A. Yes, sir, but you could determine it was state or interstate, without having the waybill before you.

Q. How would you do that?

A. For instance, if the consist showed the conductor had so many cars for Texas, we would know it was interstate freight; or if he had so many cars for Louisiana points we would know that was interstate.

Q. Suppose he had so many cars for Pine Bluff?

4222 A. We could not determine that unless we had the point of origin.

Q. It would be the same thing, if the cars came into your yards from St. Louis, or whether they came in from Hoxie destined to Texas, the consist would show the destination: but would it show the origin of either one of those two?

A. The consist does not show the originating point?

Q. You would have to have both, in order to determine whether it was state or interstate freight.

Was it any of your business to scrutinize these waybills before you could determine the origin and destination of those cars, when you were cleaning up that congestion in the yards?

A. No, sir. No more than if the freight was perishable or "red-ball" it was given special attention.

Q. You would have to look at that on the waybill and get that out first. I presume that is what your duty was?

A. Yes, sir.

Redirect examination.

By Mr. MOORE:

Q. Mr. Brown, did the duties you discharged in connection with the waybills and consists of trains in handling freight and giving directions, give you an opportunity to know about the destination

of the freight and form a judgment about the relation of
4223 state and interstate freight to be carried on the local trains?

A. Yes, sir.

Q. You were asked if you did not have to look at both columns in the waybill to determine whether or not the freight was state or interstate: if you say when you picked up a waybill that the freight was billed from a point in Kansas to a point in Missouri or Oklahoma, the fact that it was there in Arkansas would show that it came from another state: you would not have to look at another column to see that it was interstate freight, would you?

A. No, sir. You might look at either the point of origin or the point of destination to see whether or not it was interstate.

Q. If it was destined to a point in Texas you would know it was interstate freight?

A. Yes, sir.

Q. Coal is the principal traffic to Little Rock from Fort Smith—I mean traffic that originates there in the state of Arkansas?

A. Yes, sir, we have more tonnage in coal than anything else.

Q. Is it largely in excess of other tonnage? I mean tonnage that originates in Arkansas and comes by way of Fort Smith to Little Rock?

A. I would judge it is, Mr. Moore.

4224 W. L. SEELIG, a witness of lawful age, being duly produced, sworn and examined on the part of the complainants in rebuttal testified as follows:

Direct examination.

By Mr. MOORE:

Q. Please state your name, residence and occupation?

A. W. L. Seelig; St. Louis, Missouri; Auditor of the Missouri, Kansas & Texas Railway.

Q. How long have you been with that road as Auditor?

A. Eighteen years.

Q. Do you know Mr. Henry Wilmering?

A. Yes, sir.

Q. Was he employed by that railroad at any time within the last five years?

A. Yes, sir.

Q. Give the dates of his employment and what his duties were?

A. He was employed as Cashier at Cleveland, Oklahoma, from November 8, 1904, to December 21, 1905; and as agent from December 21, 1905, to May 22, 1907.

Q. What were the gross revenues taken in at that office from the time he began to act as agent there until he ceased to act?

A. Commencing with the business of January, 1906, it was as follows:

4225

1906.

| | | |
|---|---|---|
| January | Freight business | $8668 |
| | Passenger business | 3186 |
| February | Freight business | 6382 |
| | Passenger business | 2876 |
| March | Freight business | 4271 |
| | Passenger | 3088 |
| April | Freight business | 4421 |
| | Passenger | 3801 |
| May | Freight business | 3730 |
| | Passenger business | 2997 |
| June | Freight business | 3310 |
| | Passenger business | 3328 |
| July | Freight business | 3769 |
| | Passenger business | 3199 |
| August | Freight business | 3156 |
| | Passenger | 2574 |
| September | Freight business | 2700 |
| | Passenger business | 2950 |
| October | Freight business | 2488 |
| | Passenger business | 2174 |
| November | Freight business | 3054 |
| | Passenger | 2017 |
| December | Freight business | 2307 |
| | Passenger | 2151 |
| January | Freight business | 1716 |
| | Passenger | 1567 |
| February | Freight business | 2011 |
| | Passenger | 1644 |
| March | Freight business | 2237 |
| | Passenger | 1908 |
| April | Freight business | 3336 |
| | Passenger | 1523 |
| May | Freight business | 2829 |
| | Passenger | 1433 |

Q. What were Mr. Wilmering's duties as Cashier?

A. His duties as cashier would be to handle the cash, make the collections and make an accounting.

Q. He had nothing to do with the operating service?

A. Not while an agent is located at the station. His duties would be only to handle the cash and keep the accounts.

Q. What was the character and importance of that station as compared to other stations that did the same amount of business?

4226 A. I did not consider that station was of any greater importance than any other station of its size.

Q. It is a small way station?

A. It is so regarded, from the amount of the business done, except during the boom period which was in the fall of 1905.

Q. Was that before he became agent?
A. Yes, sir. For a period of about four months they did a very large business. For the month of October, the freight business amounted to $22,450, and the ticket business did $3950.
Q. Was that the largest?
A. I think that was the largest.
Q. That was not during the period when Mr. Wilmering was agent?
A. No, sir.
Q. Is there any terminal station or switch engine maintained there?
A. No, sir.
Q. What are the duties of the local agent there?
A. The duties of the local agent at that point would be similar to a small station of its size: he would handle the freight, load and unload, with such assistance as they had at that point.
Q. Was it any more extensive than the duties of any other local agent at a local station doing the same amount of business?
4227 A. No, sir.
Q. Do you know what the population of Cleveland was in 1906 and 1907?
A. No, sir, I do not. There was a rush boom in there for four months and that finally disappeared.
Q. That was in 1905?
A. Yes, sir, in the Fall of 1905.
Q. That was a case of men may come and men may go, was it?
A. Yes, sir, it was a wandering element.
Q. Where was the terminal station next to Cleveland?
A. At Osage across the river.
Q. How far away is that from Cleveland?
A. About four miles.
Q. Did the agent at Cleveland have any connection with the business at Osage?
A. No, sir.
Q. Was there an agent at Osage?
A. Yes, sir.

Cross-examination.

By Mr. HILL:

Q. Mr. Seelig, do you know personally the duties of a station agent of such a station as Cleveland?
A. Pretty well.
Q. Have you served in that capacity yourself?
A. No, sir.
Q. You never graduated out of a station?
4228 A. No, sir.
Q. What did you graduate out of, Mr. Seelig?
A. Practically I have had experience in the operating department to some extent, and in the purchasing department, but principally in the accounting department.

Q. You did not become Auditor in a day, I imagine?
A. No, sir.
Q. You have had a good deal of subordinate experience before you attained that exalted rank?
A. Yes, sir.
Q. Did you not find your experience in the various subordinate capacities in which you served had been of some use to you as Auditor of the M. K. & T. Railway?
A. Yes, sir.
Q. You would not be Auditor unless you had had those experiences, would you, Mr. Seelig?
A. No, sir.
Q. What do those figures you have just put in represent, about the business of Cleveland? Is that inbound and outbound, both?
A. No, sir, that represents the inbound. I did not take into consideration the outbound. It was practically all inbound business. There is no opportunity for outbound business there.
Q. They did not ship anything out of that country?
A. In considering the amount of business at a station we consider only the inbound business.
Q. The agent considers the outbound business, does he not?
4229 A. The agent would consider the outbound as a part of the business of the station.
Q. You have given just half the story as represented in your figures, I presume?
A. No, sir, I have given the business of the station.
Q. I understand, but as I understand your statement of it, that represents only about one-half of it—I mean just one side of the story, not half in the sense of an equal division of the business: But the agent has to attend to both classes of business, is the point I am making.
A. Yes, the agent has to attend to both classes of business.

Redirect examination.

By Mr. MOORE:

Q. Mr. Seelig, will you prepare a statement of the outbound business of Cleveland for a period of corresponding months covered by your statement already filed?
A. Yes, sir, I will try to do that. It is pretty far back, but if we still have the records I shall be glad to do it. I will do it as to the freight business. The statement given includes all the passenger business.

4230 FRANK NAY, recalled, testified as follows:

Direct examination:

By Col. MOORE:

Q. You have testified in this case before, I believe?
A. Yes, sir.
Q. I believe you have testified that you are Comptroller of the Chicago, Rock Island & Pacific Railroad Company?

A. Yes, sir.

Q. I think you stated your experience in the railroad work when you were on the stand before: I will ask you now, however, if as a part of your duty as a railroad accountant you have had occasion to make any study of operative conditions on railroads?

A. Yes, sir, to a considerable extent. I think the work of
4231 accountant official is always improved if he becomes familiar with operating conditions, and in that way is enabled to understand the results as they are reflected in the reports that come to him. And I have made it my duty, just as far as possible, to get on the line at every opportunity and study the actual operating conditions just as much as it was possible for me to do so.

Q. You have done that from actual observation out on the line, have you?

A. Yes, sir.

Q. Mr. Ludlam, a witness for the state in this case, testified that an accounting official for a railroad was better qualified to apportion and allocate expenses for repairs and matters of that sort, growing out of railroad operation, than an operating man: I wish you would state your views on that subject, if you please?

A. My views would be that an accounting official, unless he has had actual experience and up to date experience in operating matters, would not be as competent to decide as to the allocation of certain expenses as an operating man. What I mean by that is, would not be competent to decide from his own knowledge. It would be necessary for the accounting officer, to make proper decision, in any allocation of expenses, to consult with the operating officials and ascertain the actual operating conditions gov-
4232 erning expenses. And the operating official who is by his daily work in constant contact with the local conditions is better able to determine how these expenses should be allocated than any other official of the railroad, in my judgment. It has been my practice in accounting matter, wherever a question arose as to the allocation of an expense, to obtain complete information from the local official in charge of the work before determining how the expense should be charged.

Q. Do you regard that information as primary facts which it is essential to have knowledge of in order to be able to allocate and compile the expense of operation?

A. Yes, sir.

Q. I suppose the experience of an operating man qualifies him better, and fits him better to determine about the proper allocation of expenses of that class than the experience of a simple accounting man?

A. Yes, sir, and that is true for another reason: conditions may change and an accounting man who has had experience in past years might, if he attempted to allocate expenses without consulting an operating man, base it upon conditions which existed some years ago than which do not exist now.

Q. If an accountant is going to divide any class of operating ex-

penses between different classes of trains, say between local
4233 and through trains, it would be necessary, as I understand you if he did not possess the information himself, to obtain the information from operating officials to enable him to determine the cost and expense as between the two classes of service?

A. Yes, sir, that is true when it is necessary to make an estimate or approximation. That is to say, if you were going to divide the expense between local and through trains, the accounting official could, without consulting the operating official, determine certain expenses. He could determine the wages of the train crews on each train; and he could determine the coal used on each train, and perhaps some other supplies. To that extent—that is, to the extent where the actual cost can be definitely ascertained, it would not be necessary to consult the operating officer. But where any expense was involved that could not be actually and definitely assigned to either service, then in order to produce a fair result, it would be necessary, in my judgment, to consult freely with the operating officials who had knowledge of the local conditions.

Q. And in that I suppose you would include the expense of maintenance of cars, locomotives and things of that character?

A. Yes, sir, every expense except those few items I have mentioned, which can be definitely assigned to either one or other service.

Q. Have you examined the exhibits filed in this case by
4234 Mr. Wharton, a witness for the state, which are designated alphabetically from I to N, containing formulas for dividing expenses for freight service between local and through trains; and for passenger service between the classes of cars used in that service; and the results from that method of division?

A. Yes, sir.

Q. I wish you would state what your views are in regard to the practicability of dividing the expense of the transportation of freight by first separating it as between local and through trains in the manner that is attempted in Exhibit K filed by Mr. Wharton?

A. My opinion is that it does not reflect true conditions or true relative cost of the two kinds of service.

I have read the testimony regarding these exhibits, and as I recall it, the opening statement was that they would present actual facts as opposed to theories.

After examining these exhibits carefully, I am unable to find any results—that is, any assignment of expense between local and through, or between state and interstate that is an actual fact.

Q. Or based on actual facts you said?

A. Or based on actual facts.

The method subdivides the total operative expenses into various subdivisions, and treats of each subdivision separately.

The expenses that are grouped in these subdivisions are divided on various bases, many of which have little or no relation
4235 to the expenses that are subdivided thereon. The method is complicated, and is capable of being adjusted or manipulated—I am not using the word manipulated in an offensive sense—

but it is capable of being changed or adjusted in different ways throughout the details, that might bring entirely different results in different cases. The attempt is sought to divide what are termed train expenses between local and through, and those which are not train expenses between state and interstate. And then after the total local and through train expenses are ascertained, by a series of approximations, without any actual results being obtained, or without being based on any actual results, the entire expense of those trains is then apportioned between state and interstate on a ton mile basis which is another approximation of this summary of approximations. It might or might not produce a fair result. If it did produce a fair result I think it would be a coincidence or an accident.

Q. What do you think of the practicability, in the first place, of making the division of expenses as between through and local trains in the manner that is attempted in the state accountants in that exhibit? What I mean to ask you is, do you think it possible to make a fair division on any such basis as that, by dividing it into the separate elements of train cost, and in that way separating and dividing it between the local and through trains in your investigation of that exhibit?

4236 A. I think it is not possible to make such a separation with any degree of accuracy, except perhaps in one way:

There is a principle of accounting which is used by expert accountants in connection with manufacturing and mercantile business, which provides that indirect expenses shall be apportioned on the basis of the direct expenses of any class of service. It would be possible to obtain the direct expenses of through and local trains in the event such a separation was attempted, which would be the expenses I have heretofore referred to, namely, the wages of the train man, the fuel and other supplies of the train; and having obtained those direct expenses, then divide the indirect expenses on the basis of the direct expenses.

That is a method of accounting which is approved in mercantile lines of business, and if I should attempt to make a division of that kind, an arbitrary division, which it would be, I think that would be a fair basis for dividing between local and through.

Q. Do you think such a basis as that could be used and be as satisfactory and fair, for apportioning the expenses for conducting state and interstate traffic on a railroad?

A. No, sir, I don't see how it helps very much, because state and interstate freight are hauled on both kinds of trains, local
4237 and through, so if you have gone to the trouble of separating the expense between local and through you still have left the problem of separating the expense of each class of trains between state and interstate, which is the same problem with which you are confronted, before you have made that division.

Q. To take the matter up somewhat in detail, I want first to call your attention to the scheme which is presented in this Exhibit I for ascertaining the relative tonnage on the two classes of trains, that

is, local and through trains. You are familiar with the method adopted by them for that purpose, are you for that purpose?

A. Yes, sir.

Q. Please state what you understand it to be?

A. My understanding of the method used by the state's witnesses in ascertaining the state and interstate business one mile on local and through trains is as follows:

They took the conductor's reports, commonly known as "wheel reports" of all the local trains that were run during the month of October, 1907, and drew from those wheel reports the numbers of the loaded cars. They then traced from those car numbers the waybills covering as many as they could find. I understand they were unable to find all of the waybills covering those cars. After locating the waybills, the separation was then made between state and interstate shipments, and the tons one mile, state and interstate, were computed for carload freight only.

I understand that all of the less than carload freight was con-
4238 sidered to be state business; that is, less than carload freight that was hauled on local trains.

Having obtained those results, which purported to show state and interstate tons one mile, transported on local trains in October, 1907, they deducted those results from the total tons one mile for October, 1907, state and interstate, as compiled by the Railroad Company.

Q. That compilation is shown in Exhibit 26 filed in this case, is it not?

A. I am not familiar with the number of the exhibit.

Q. You may assume that it is.

A. Very well. What was left was assumed to be the tons one mile, state and interstate, that were transported on through trains.

However, the total tons one mile for the month of October, 1907, as computed by the railroad company covered only shipments that were taken into the accounts of the Company in October, 1907, regardless of whether the shipments actually moved over the rails in that month or at some other time.

Q. Mr. Nay, I wish you would state if a correct result can be arrived at by that method of division as between the tonnage of local and through trains?

A. I think not—I am sure not.

Q. Give your reasons please?

4239 A. For the reason that the business of the company is not taken into account according to when it actually moves in the trains, but is taken into account as follows:

System business which covers shipments moving between points on the Missouri Pacific system (including the Iron Mountain) is taken into account on what is known as the (forwarded basis) that is, all system waybills dated in the month of October, 1907, were taken into account for that month regardless of whether the shipments were actually hauled on the trains in that month or not.

Under that plan system waybills dated during the latter part of October, 1907, and which started to move in October, but finished

their journey in November, 1907, would be taken into account by the company in October for the full journey.

But the state's accountants in compiling the tons one mile from the conductors' wheel reports, would include only that portion of the journey that actually moved in October.

The same condition prevailed at the beginning of the month. That is to say, the waybills dated during the last few days of September, 1907, which were en route at the end of the month, were taken into account by the company for the full journey in September, 1907; while the state accountants would have in their reports for October the ton miles covering the completion of the journey in October. The railroad's figures would include nothing whatever in October accounts covering such shipments.

4240

Q. One moment, please. Let me see if I understand you: You stated in your last answer that in ascertaining the freight carried on local trains, as shown in these exhibits, the state included only that part of any movement that was billed on the system anywhere, which occurred in the state of Arkansas during the month of October?

A. That is my understanding, yes.

Q. But on the other hand, that the accounts kept by the Auditor, as to what you call "system business"—that is, business which originates anywhere on the system, would be entered on the books on the forwarded basis—and by "forwarded basis" you mean as of the date the shipment was billed, the waybill made?

A. Yes, sir.

Q. The result of that would be, if a shipment was made and billed in Missouri or Nebraska or Oklahoma, in October 1907, it would go in the auditor's account as an October shipment, without regard as to when it passed through the state of Arkansas?

A. Yes, sir, if the waybill is dated in October.

Q. If a waybill on any part of the system, covering the several states, is dated in August or September, it would go into the auditor's accounts as of August or September as the case might be?

A. Yes, sir.

4241

Q. In case there might have been some delay, it might have passed over the rails in the state of Arkansas in the month of October?

A. Yes, sir.

Q. That I understand, is the effect of what you call the "forwarded basis"?

A. Yes, sir.

Q. As I understand the effect of this manner of keeping the auditor's accounts, it would be to include the business billed in Missouri or Nebraska in the latter part of October, which would not reach Arkansas until the early part of November, and exclude business billed in August or September in other states, and which might have passed through Arkansas in the month of October?

A. Yes, sir.

Q. Now you may proceed with your statement, Mr. Nay?

A. The interline business represents business covered by way-

bills reading to or from points on other railroads, and is divided into three classes: Interline forwarded, interline received, and interline through or overhead.

The interline received business covers waybills made by other railroads reading to stations on the Missouri Pacific system, and is taken into account when such waybills are reported by the agents at destination.

In that way waybills which reach destination during the early part of October which travel part of their journey over the
4242 Iron Mountain in the month of September, would be included in the company's tons one mile, but that portion of their journey which was travelled in September would be excluded from the figures compiled by the witnesses for state.

Q. Suppose a shipment which passed through Arkansas in the month of October was received in Texas or Louisiana in November or even in December: on that basis as to what month would it be entered in the auditor's account?

A. It would be entered on the auditor's accounts in either November or December, according to when the shipment reached destination.

Q. Although it may have passed over the lines in Arkansas in October, it would not enter the auditors accounts for that month?

A. No, sir, but the tons one mile, covering the actual movement in Arkansas would be included in the figures compiled by the experts for the state.

Q. You mean that would be included in the figures worked out by the state's witnesses for the purpose of showing the tonnage of local trains in October?

A. Yes, sir.

Q. If it happened to get on a local train in Arkansas?

A. Yes, that is true. And that is true of all shipments I believe, that I spoke of as being included in the state's figures, because they computed local trains only, and deducted the tonnage on the
4243 local trains to arrive at the tonnage on the through trains.

Q. But while, if a car, in which freight was hauled happened to be hauled on a local train, it would be taken into account by the figures prepared by the state's witnesses for the purpose of showing the tonnage of the local trains, yet it would not be in the auditor's account, and, therefore, would not appear in the total of business from which the tonnage of the local trains was subtracted by the state's witnesses: is that correct?

A. That is right. And, furthermore, if that shipment or any shipment of like character moved part of the distance on through trains across Arkansas, and part of the distance on local trains, the state's witnesses would have entered the figures only for the mileage that actually moved on the local trains, and would omit the mileage moved on the through trains.

Q. Now you may proceed with your statement, Mr. Nay?

A. The next class of interline business is known as "interline forwarded," covering shipments that are waybilled at stations on the Missouri Pacific system going to points off that line and on some

other railroad. The waybills for such shipments are taken into account by railroads when they are reported by the destination carrier, and the destination carrier reports them when the agent at destination reports the receipt of the shipment to his accounting department.

4244 Q. That may be weeks after it has passed through the state, may it not?

A. It may be a long time. In actual railroad practice I think every railroad in the country has a large number of waybills of that kind, which are being constantly traced.

The Rock Island has several men tracing waybills that are not reported until some time after the close of the current month.

In case there is a congestion it sometimes happens that such waybills are reported several months after they actually move over the rails of the original carrier.

Q. What effect would a congestion in traffic have in the way of delaying the entry in the books of the auditor in that class of shipment?

A. On all interline business it would serve to increase the delay. The system business being taken up on a forwarded basis, congestion would delay the actual movement. But on interline business, which is taken up by the receiving carrier, when it reaches its destination, any congestion delays the reporting of that business, and, consequently, the taking of it into account.

This interline forwarded business is subject to perhaps the greatest delay of any (except perhaps the third kind of interline business which is through or overhead) because the company

4245 which originates the business has no control of when it is reported, and usually a large portion of the interline forwarded business of any carrier is not reported until after the close of the month in which it actually moves over the line.

In this case waybills would be taken into account for October, 1907, which covered the actual movement in months prior, say in September or August, or even in months prior to August.

While those shipments would not actually move in October, they would be omitted from the figures compiled by the state's witnesses, so far as the movement on local trains is concerned.

Likewise, at the other end of the month a large amount of traffic would actually move in October, which would not be taken into the company's account until a subsequent month; but such shipments, if they moved on local trains, would be included in the figures compiled by the state's witnesses.

The third class of business is the interline through or overhead, covered by the waybills made at stations on other roads, which passes across or over the Missouri Pacific, and has destination on some other road, the Missouri Pacific being the intermediate road.

This business is taken into account on a "received basis": that is, reported by the destination carrier in the same manner as the interline forward business.

4246 Q. You mean by that it is taken into account as of the date it is reported by the agent who receives it at destination?

A. Yes, sir.

Q. That is what you call the received basis?

A. Yes, sir. Of course, that is subject to the same delay in reporting as the interline forwarded, and would cause similar discrepancies between the company's tons one mile and those compiled by the state's witnesses.

Q. In view of the conditions you have just described, can a correct division of the amount of freight carried on the two classes of trains for a given length of time, say the month of October, 1907, be obtained in the way the state's witnesses have attempted to obtain it in this case?

A. No, sir, I think not. And the reason is that there is a principle in accounting which prohibits the deduction from any aggregate total something which is not included in that total.

For instance, suppose a man has on hand ten thousand tons of coal (using this for illustration) and some of it being hard coal and some of it soft coal: and he wishes to determine how much there is of each. If he can accurately measure how much of the coal is hard coal, he can by deducting that from the total arrive at the number of tons of soft coal. But he must be able to determine accurately either one or the other factor in order to reach the second one by deduction.

If in the case of the coal the man should decide to take
4247 the sales for a month as the hard coal on hand, and his sales amounted to say five hundred tons; and as a matter of fact, there were one thousand tons of hard coal on hand; he would by deducting from the ten thousand tons on hand originally conclude that there were ninety-five hundred tons of soft coal on hand, while as a matter of fact, there were only nine thousand tons of coal.

On the other hand, if he should deduct fifteen hundred tons of hard coal, if the sales amounted to that much, he would be violating the principles referred to of deducting more tons of hard coal than were there. And that would leave an erroneous result, in either case deducting more or less than the actual number of tons of hard coal, would leave an erroneous result as to the actual number of tons of soft coal.

In arriving at the actual number of ton miles hauled on the through trains by deducting the tonnage actually hauled on the local trains, from the company's figures, which were compiled without reference to the tons actually hauled, unless it should happen, (and it would be a coincidence or accident) that those tons actually hauled should really agree with the tons taken into account as hauled on the local trains, the result left as to the tons on the through trains, would be erroneous. It is scarcely conceivable that the number of tons actually hauled on the local trains in October, 1907, would be the same as the number of tons that were taken into account in
4248 1907 some of which was actually hauled prior to October, 1907, and some of which was hauled subsequent to October, 31 1907, should be the same.

I might add, that in my experience on the Rock Island, we ran

across this descrepancy several years ago in compiling operating statistics for our superintendents and general superintendents and operating men. We found that the so-called "lap-overs" from month to month did not equal each other—in fact, they were entirely different; and were so very different as to distort our monthly averages.

Beginning with March, 1906, the Rock Island has been computing the tons one mile, used in connection with operating statistics for our operating men, from the conductor's wheel reports, thereby obtaining the tons actually hauled during the month over each division; because we were unable to obtain the tons actually hauled, from the waybill figures.

We have made comparisons each month of the total tonnage one mile, ascertained from the conductor's wheel reports, and from the total tons one mile as compiled from the way-bills, and they are quite different from month to month. I think they will average a difference of ten per cent or more.

Q. From your experience in the effort you made on the Rock Island, do you think that the inequalities and defects in this system would not be remedied by being evened up, or through any uniformity in the "lap-overs."

A. No, sir, and certainly not for one month. The lap-overs
4249 for one year when compared with the business for a whole year, have only one-twelfth of the effect they would have on the business for one month.

Of course it is evident to anyone that the lap-overs at the beginning of the year will be the same as the lap-over for the first month of a year; and what I am trying to say is, that the effect of the lap-overs when applied to the business of any one month, is very much greater than if applied to the business of a long period—say a year.

That was the difficulty we had in our operating monthly statistics. In one month the tonnage that was omitted from our way-bill account, made the divisor into the expenses so small that the cost per ton mile was largely increased. Then the next month we would have tons in our account in excess of what was handled, and the reverse would be true—the expense would run a way down.

As those figures are used almost entirely for comparative purposes, the comparisons were destroyed on account of these lap-overs being so unequal.

Q. And you found it so impracticable that you abandoned it did you?

A. We abandoned it for our monthly operative statistics by divisions, and ever since have been making those compilations, based on the tons actually hauled in the trains.

Q. What would you say as to the month of October as compared with other months, as to its effect upon lap-overs, considering
4250 the character of the business done in Arkansas in that month, and any changes made in the character of the commodities at that time from that which might have prevailed in the preceding month.

Mr. KIRBY: That would necessarily be a guess on his part if he is testifying as to the Iron Mountain road.

Col. MOORE:

Q. You are familiar, are you not, Mr. Nay, with traffic conditions in the state of Arkansas?

A. I am familiar with those on the Rock Island, and presume in that period there was a similar condition on the Iron Mountain.

Q. As a matter of fact, are not the general conditions the same throughout the state, as to the character of the traffic being affected by the change from the summer to the autumn business?

A. Yes, sir, I think that is true. I spent about fifteen years on the Cotton Belt, and that was true on that road. And I know that on the Rock Island road the October business is usually the heaviest of the entire twelve months.

Q. What effect would those conditions have upon the figures of the lap-overs you speak of?

A. October being the heaviest month, there would be a greater congestion during that month, which would tend to emphasize these lap-overs.

Q. The state's accountants have taken, as you will see from an examination of their method, the month of October, as rep-
4251 resenting all of a period of six months, covering from July to December inclusive; what do you think of that month as being a representative month for the purpose for which it is used by the state's accountants in the exhibits referred to?

A. I should say that no month is representative of any six months, or of any twelve months, and, certainly, if I would choose a representative month, I would not choose the heaviest month in the year. An average month might be more nearly representative than either the heaviest or the lightest month, but I think where actual results are desired, no one month should be taken as representing a period.

Q. I want to call your attention somewhat in detail to the divisions that are made in Exhibit K.

The first item that is taken up there is "Maintenance of way and structures expenses" which is divided in this exhibit between local and through trains on the basis of the total engine miles and car miles of each class during the month of October (which it is stated in the exhibit is regarded as representative of the business of the six months ending December 31, 1907):

Now you have already discussed in a general way your views as to the incorrectness of any month, and of that month of October in particular, being considered as representative of a period; have you anything further to say in this connection, as to making this division of expenses on that or any other basis, as set out in
4252 this exhibit?

A. You mean as regards the month of October?

Q. Yes.

A. I don't know that I have.

I still feel that that same thing applies to maintenance of way and structures as to other expenses—that October is not at all representative, and that no one month should be taken as representative, where we want to obtain accurate results.

Q. When you say "Accurate results" do you mean actual results or true results?

A. I mean true results.

To take October, the heaviest business month of the year, the maintenance that was going on at that time would naturally be of a kind that would not interfere with traffic.

The railroads usually, and I think good management requires it, do their heaviest maintenance work when the traffic is light, because certain maintenance work, such as rebuilding bridges, ballasting, laying new steel and so forth interferes always to some extent with movement of trains. So I do not think that maintenance expense in the heaviest business month of the year would be correct, because in the first place the expense would not be representative, and in the second place the car miles would not be representative

4253 Q. I was going to ask you about that:

That item represents $553,000 of expenses, and it is divided on the basis of the engine and car miles. I want to ask you what you think of that method of division: if it is proper to divide that expense on that basis?

A. No, sir, I don't think it is:

In the first place, I think it is impossible to divide the expense accurately or truly between local and through service; but if such a thing should be attempted I think the car miles is an improper basis of division because a very large part of the expense, perhaps ninety per cent of the total expense, is not directly affected by the car mileage.

A very large part of this expense is due to deterioration and action of the elements, and would have to be incurred whether the car mileage was more or less. And this feature does not take into consideration the density of traffic, which is an important item to be considered.

The ties must be renewed in the track and the lifetime of a tie is eight, nine or ten years, some shorter, and some longer, regardless of whether your traffic is heavy or light.

Repairs to buildings, fences, telegraph lines, shops, fuel stations, water stations, round houses; sub-structures, of bridges, ditching, surfacing, aligning, and all that sort of thing, a very large

4254 proportion of the expense has no relation to mileage.

Mr. KIRBY:

Q. Is not all you have mentioned, or a large part thereof, more properly chargeable to deterioration or replacing equipment? Don't you charge off so much every year for replacement or for deterioration?

A. No, sir. Under the rules of the Interstate Commerce Commission we make a charge after replacement is made.

A new tie that is renewed today, that has been worn out by traffic passing over it during the last eight or nine years, but the expense goes into the expenses of October, 1910.

The same thing is true of the expense of the rails which have been worn out in the course of five, ten, fifteen, twenty or some-

times thirty years, according to the density of traffic. Now the renewal of the rail is charged to maintenance at the time the renewal is made, although it was worn out in prior years.

Col. MOORE:

Q. So the damage that makes that part of the maintenance and structures expense that is affected by the operation of trains, may have occurred years before the expense was incurred?

A. Yes, sir.

Q. The state, for the purpose of getting a basis for separating the expenses of freight and passenger business, accepted the basis used by the railroad for dividing maintenance of way and structures expense, which is on a train mile basis I think; is that correct?

4255 A. Yes, sir.

Q. If one were going to attempt to divide these expenses in this way between passenger and freight service and between local and through trains, is it consistent to adopt one basis for one purpose, and another basis for the other purpose, as they have done?

A. No, sir, I think either the train mile basis should be used in both cases, if such a division is attempted, or the car mile basis should be used in both cases.

Q. Have you studied these exhibits enough to have an opinion as to whether the train mile basis or the car mile basis would produce the better results for the interests of the state in this proceeding?

A. You mean dividing the expense between local and through?

Q. What effect would a division of these expenses between local and through trains, on a train mile basis, have upon the proportionate expense of the two classes of trains?

A. The train mileage would throw considerably more expense to the local, than the car mileage; because the local trains have fewer cars than the through trains.

Exhibit I shows that the average number of cars per train is 16.1 for the local trains, and for the through trains 32.2 cars; exactly twice the number of cars in the through trains as in the local trains.

for that reason the train mileage basis would assign a much

4256 greater proportion of expense to the local business than the car mileage basis.

Q. So one basis (that is the car mileage) would produce one result; and the other basis (that is the train mileage) would produce another and a different result?

A. Yes, sir.

Q. If it were proper to make a division of this expense between the local and the through trains, could it be done correctly without regard to the weight of the cars and of contents? In other words, to the extent that maintenance of way is affected by operation is the effect not greater or less as the car is heavily or lightly loaded?

A. I think it is greater in the case of cars that are more heavily loaded.

That is illustrated from the fact that frequently it is necessary to strengthen bridges and put in heavier rail, and do a lot of work to strengthen the track, in order to take care of heavier equipment.

The track might be all right for light loading and light equipment, but when heavier equipment is put on, a general strengthening must take place, which proves that the heavier equipment causes more repairs than the lighter equipment.

Q. Would a division which disregards the weight of the equipment be correct?

A. No, sir, I don't think it would be fair.

4257 Q. I am referring, of course, to that part of the operation which produces this expense?

A. Yes, sir, I understand; that small percentage which is affected by car mileage?

Q. Yes, that is what I am referring to.

A. No, sir, I think if an attempt was made to divide that between local and through trains, certainly the weight of the equipment should be considered.

Q. Would the same be true if you attempted to divide it on a car mile basis?

A. Yes, sir.

Q. The state's accountants have added fifty per cent to the engine mileage of local trains for station switching, in making their division; and are assuming that each engine mile was the equivalent of two and one-half car miles:

Do you know of any reason why fifty per cent should have been adopted there?

A. No, sir. I think that is an arbitrary percentage, and I do not know whether that is enough or too much.

Q. Is there any way you know of by which that could be determined?

A. None that I know of.

Q. Would the extra mileage, or the extra expense on that account be likely to be uniform from day to day and week to week, and so on?

A. You mean growing out of this fifty per cent?

Q. Yes?

4258 A. No, sir, it would not be the same, from day to day, because I have known local trains on one day to be delayed by switching at stations until they were ten or twelve hours late, and the next day they would go through practically on time, doing much less switching.

Q. Isn't that condition affected also by conditions of congestion, and by the character of the traffic that is hauled at different seasons of the year?

A. Yes, sir.

Q. In your judgment, can any such assumption as that be established on the basis of experience in railroad operation?

A. I don't think so, and especially for the reason that only a small percentage—I have estimated it at ten per cent—of the maintenance of way expenses are due to the wear and tear of the cars and engine over the tracks. And the relative wear and tear in switching service as compared with road service is a thing that cannot be determined.

So I think it would be very difficult, if not impossible, to obtain a percentage that would represent the true conditions.

Q. They have also assumed that each engine mile is equivalent to two and one-half car miles: what have you to say as to that assumption?

A. I judge that is based on an engine having twenty wheels while a freight car has eight wheels. If that is the basis, I think
4259 that is wrong, because very few engines have twenty wheels—only a very small portion of them. But as the engine is so much heavier than a car, if I were attempting to make a division between local and through, I think I should make that proportion much larger than two and a half—not because of the number of wheels, but because the engine is so much heavier than any car.

Q. Referring to the allowance of fifty per cent for station switching in this connection, do you think it would be proper to charge as large a proportion of it to interstate business, that is, business coming into and going out of the state from another state, as you would charge to intrastate business?

A. No, sir, I would not. That is to say, I think a greater portion of that charge if we could ascertain what that is, should go to state business than to intrastate.

Q. Why do you think that is true?

A. Because that extra switching with regard to state business must be done at each end of the shipment; that is, at the point it starts, and at the point it stops. There would be two services of that kind for each state shipment, and only one service in Arkansas for each interstate shipment. By "interstate shipment" I mean into and out of the state and not trans-state.

Then, again, as the average haul for state shipments is less than for interstate shipments, this excess of cost switching at stations would be still further emphasized to the extent of that difference in the length of the haul.

4260 Q. Some of the state business originates at terminals and is switched by yard engines: you do not mean what you have said to apply to that, do you?

A. No, sir, but I am assuming there is a corresponding amount of interstate business which originates and terminates at terminal points, and is handled by yard engines.

Q. That would offset that?

A. Yes, sir.

Q. Does not a larger proportion of interstate freight run through to the end of the train run, than state freight? That is, isn't there more intermediate handling between the beginning and the end of a run on state freight than on interstate; and does not that cause more switching?

A. That would be my judgment, for the reason that the average haul is less.

Mr. KIRBY:

Q. Do you mean local or through?

Col. MOORE:

Q. That is more largely true of local than of through, is it not?

A. Which do you mean Judge?

Q. The proportion of state and interstate freight which runs through to the end of the train run: what would be your idea about that?

A. I don't know that I quite understand that question.

Q. Mr. Kirby suggests that local and through trains both carry both kinds of freight: and he asks if your answer that the larger proportion of interstate shipments go to the end of the train run is true of both classes of trains, or only of the local trains?

4261 A. I think there would be more interstate shipments running through from one divisional terminal to the other on the through trains than on the local trains.

The local trains pick up interstate shipments and haul them to terminals, where they are put into through trains. They also take interstate shipments from terminal points and distribute them to the various stations.

Q. Under the head of "Maintenance of Equipment" Exhibit K divides the expense of maintenance of locomotives between yard locomotives and local and through road locomotives on the basis of the locomotive mileage of each class. Then they add fifty per cent to the mileage made by the yard locomotives to provide for the possible extra maintenance due to yard service:

Do you know of any basis upon which that fifty per cent additional can be accounted for?

A. No, sir.

Q. Have you any reason to suppose it is correct?

A. No, sir. I have never made any investigation as to the amount of extra repairs due to yard service.

Q. This is an addition of fifty per cent mileage to provide for possible extra maintenance expense due to yard service. The accountant, Mr. Wharton, who filed this, stated it was an arbitrary assumption; that they have no information or no means of obtaining any information.

What do you think about that method of proceeding to

4262 make such a division of this class of expenses?

A. Making an arbitrary assumption, without anything to base it on, might or might not lead to true results, and is more apt not to, I should think.

Q. Are there any actual facts, or facts you know of, which would call for that allowance, in railroad operation?

A. No facts I know of.

Q. Then they add fifty per cent to the mileage of road locomotives in local service, to provide for possible switching mileage; and again fifty per cent of the switching mileage of the local train engines thus obtained, to provide for possible extra maintenance for switching service:

Do you know of any actual facts that would justify or account for that allowance?

A. No, sir, that is arbitrary.

I assume that fifty per cent is similar to the fifty per cent under maintenance and way, to cover the extra switching; and then they add fifty per cent to that fifty per cent which is allowed for extra switching.

I don't know why that should be done.

Q. Something above $69,000 of this charge is divided between local and through service on the basis of the number of cars of each class handled by yard engines during the month. They assume that every car that comes into the terminal, and every car that goes out of the terminal is handled in coming in and going out: is that a fair basis of division of that part of the expense of maintain-

4263 ing locomotives?

A. No, sir, I don't think so.

Of course, in the first place this expense of $69,135.80 is arrived at on the arbitrary basis that has been referred to—the basis of locomotive mileage with those additions. But dividing that on the basis of the cars in and out, between local and through, would mean that the same service by the engine was performed in connection with every car; while a large number of the cars handled in the through trains would receive no service whatever from the yard locomotives.

I refer to those cars that go on through the terminal and have not destination at the terminal. They simply stand there until additional cars are set on, and then there will be a caboose put on the end and the engine in front, and they will go on straight through without receiving any switching from the yard locomotive.

These cars, under this basis, are treated just the same as the cars that have destination at the terminal point and which may be switched two, three or four miles to some industry. In my judgment, that method of treating all cars alike is erroneous.

Q. Would it be possible, Mr. Nay, to divide this class of expense growing out of repairs to yard locomotives, between the cars, the switching of which causes the necessity for the repairs, unless you could get every car, and keep account of every car that was switched, and the degree and amount switching that was done for that

4264 car, and divide it in that way; is there any other way in which there could be an approximation to a correct division of that item?

A. I don't know of any other way.

Q. Would it be practicable or possible to obtain such data or division to enable a division to be made in that way?

A. It might be possible, but I don't think it would be practicable. It would require a clerk with every switching crew, and then some more clerks to compile their results with blank forms, which would add a great deal to the expense, and make it impracticable. And even then, if you followed that plan, by keeping an actual account of the cars that were actually handled by each switching engine, it would have to run over a period, because the repairs to the engines are similar to the renewal of rails we spoke of—the engine goes into the shops for general repairs, and receives renewals and repairs, costing a considerable sum of money, say from twelve hundred to two thousand or three thousand dollars, and those general repairs

were made necessary by service covering a period of months, since the engine was in the shops for general repairs.

It is impossible to determine the wear and tear that occurs each day, even if you know the actual number of cars switched each day, and the service for each car.

Q. Anyway, it would be impossible to make any such division with any approximation to correctness, without keeping such accounts, and having such information, would it not?

4265 A. Yes, sir.

Q. The expense of maintenance of freight cars is nearly $478,000: this expense is divided between starting and stopping trains at way stations, repairs due to terminal handling of cars in local service; and the remaining expense is charged in a lump.

Now, in ascertaining the amount that should be charged to starting and stopping, the work written by A. M. Wellington in 1887 is followed: Mr. Wellington assumed that 21.5 of repair expenses for freight cars was due to starting and stopping:

Do you know whether any changes in the construction of freight cars have been made since the time that book was written, which would affect these relative expenses?

A. Yes, sir. The addition of the air brake I am sure would cause quite a change in those expenses. That is to say, in 1877 when a train was stopped it was stopped by the use of hand brakes. The brakeman would climb on top of the cars and set the brakes on one car and then on to the next, and the stop was bound to be gradual, under those conditions. While today, with the use of air brakes, stops are frequently made with great suddenness, such as to cause considerably more damage by stopping than in the days when hand brakes only were used.

Q. You think that per cent would be increased?

A. If it was 21.5 per cent in 1877 I am sure it ought to be much greater now.

4266 Q. They have divided the expense of terminal handling of cars on a car mileage basis: is there any reason why a different basis should be adopted for dividing that expense than was adopted for dividing the expense of yard locomotives, which was divided on the basis of the number of cars?

A. I should think if I were making a division of that kind I would be consistent, and would use the same basis for dividing repairs due to terminal handling that would be used in dividing repairs on locomotives. Because I understand the terminal handling is the handling at terminal points where the car is stopped and set out or picked up.

Q. And the damage is inflicted on the car in handling it in that way at those places?

A. Yes, sir.

Q. What connection has car miles with that?

A. I don't think it has any connection, because the terminal expense is due to the shifting of the car at the terminal point, which would be the same whether the journey of the car was ten miles or one thousand miles.

Q. Its handling in the yards would be purely local?

A. Yes, sir.

Q. Just as much so as the damage to the engine when handling the car at the terminal?

A. Yes, sir.

Q. The state accountants have allowed double handling
4267 in ascertaining the expense of terminal handling of the cars, but they made no such allowance in the case of yard locomotives. Is there any reason for that distinction in your opinion?

You will find yard locomotive expense divided on the basis of double the number of cars handled in each class of service. I don't know, so I am asking you what reason there could be for that difference?

A. I don't know. One is based on the cars handled, and the other on the car mile.

As I said before, I don't understand what relation the miles made by the car have to the damage caused by handling it in the terminals. As I see it, the car mileage has no relation, and, therefore, doubling the car mileage of local trains does not help the matter any. And if doubling the local car mileage and making a percentage of that result and comparing it with the through car mileage is a right basis for dividing repairs to cars caused by terminal handling, then I would think that is the right basis for dividing repairs to engines in terminal service, and, vice versa, if the car handled is the right basis for dividing repairs, then it would be the right basis for dividing repairs on cars themselves, due to terminal handling.

Q. Is either basis sound, or has it any reason in any operating conditions you know of?

A. I don't think so.

Q. I want to call your attention to the division of station
4268 expenses under the general head of "transportation expenses" that is divided between interstate and intrastate business on the same basis of the number of tons of each class of traffic, assuming that each intrastate ton was handled twice, and each interstate ton handled once. A later exhibit was filed by the state (Exhibit Y) in which they excluded trans-state tonnage from that expense: I will be glad if you will state your views as to the fairness and correctness of that division?

A. The tons that are included in the basis for this division, with the trans-state omitted, includes both carload and less than carload shipments. Practically all carload traffic is loaded and unloaded by the shippers and consignees, so the only item under the head of "station expenses" that refers to carload business is office expense, the expense of billing, recording and so on.

The large item of station labor, what we call platform labor, loading, unloading and checking, is in connection with the carload business. (Should be less than carload. See page 1029.)

Therefore, I do not think it is fair to divide the expense on the basis of the tons handled, including the carload business, because a greater portion of the state tons handled is less than carload business

than in connection with the interstate traffic. That being the case, the basis used does not charge a sufficient proportion of this expense to the state traffic, and charges too much to the interstate traffic.

4269 Q. Any basis that ignores the difference between carload and less than a carload could not be fair or correct, could it?

A. No, sir.

Q. The next item to which I want to call your attention is "yard and terminal expenses." These are divided on the basis of the number of cars handled at terminals, in and out; just as was the case in yard locomotives maintenance, since this exhibit is filed a changed and additional exhibit has been filed (Exhibit Y) reducing the cost of through trains twenty-five per cent.

A. That is, making a percentage based on the total local cars with seventy-five percent of the through cars?

Q. Yes. The plaintiff, St. Louis Iron Mountain & Southern Railroad, has filed the consist of a through train from St. Louis to Texas covering every day in the month taken by the defendant for that test, being the month of October, 1907; some of those trains were solid trains which required no switching at all; some of them were mixed trains, in which there would be groups of from twelve to fifteen to thirty to forty through cars from St. Louis to points in Texas, which required no switching, possibly there would be other cars attached to these trains destined to Little Rock, Arkansas, and others to points on the Valley Line and Fort Smith line, which had to be detached and switched at Little Rock or Hoxie. All of those cars required switching.

4270 All the cars and all the trains are charged with the same proportion of the expenses in the original exhibit filed; in the later exhibit filed by the state (Exhibit Y) the division is modified by deducting twenty-five percent of the cars carried on the through trains leaving as the cars among which the expense is to be divided all cars hauled on the local trains, and seventy-five percent of all the cars hauled on the through trains.

I will state further that the evidence shows that different degrees of switching are required by different cars, and that the expense of switching to industries is very much larger than the expense of transferring cars from the main line to other lines:

Will you state what you think of this method of division, for dividing this class of expenses?

A. I think it is inaccurate for the reasons stated in connection with the repairs to yard locomotives, that it considers that the service given to each car is exactly the same, regardless of whether it may not be touched or handled at all by the switch engine; or whether it may be switched two, three or four miles to an industry.

Of course, that is modified now by the amended exhibit to the extent of considering the service of each car handled in the through train to be only seventy-five percent of the service as compared with the cars handled in the local trains. But still that does not seem to me to be a fair basis, for the reason that so many cars in the ordinary

course of business on any day are handled by the through
4271 trains, go right through the terminals where those yard engines are without receiving any service whatever from the yard engine.

Q. Would the allowance of this twenty-five percent cure the unsoundness of their basis, in view of the facts in this case to which I have called your attention?

A. I don't think so.

Q. Is not what you said in regard to the impracticability of dividing those expenses on the basis of the number of cars handled in connection with terminal handling of freight cars, true also of this charge?

A. Yes. Of course that is further emphasized by the fact that it is based on the figures for one month, and that criticism as stated in the first place, applies all the way through—that the figures for one month should not be taken as representative of a period.

Q. On this exhibit fuel and locomotive expenses are divided on the basis of a test made on the St. Louis Southwestern Railway (The Cotton Belt) in October, 1908: you have the division before you there, Mr. Nay?

A. Yes, sir.

Q. What do you think of the soundness of that method?

A. I don't think much of it. It does not seem to me to be proper at all, to take a test made for only one month, on another railroad, and that month being entirely outside the period under consideration, and apply it to this period of six months ending Decem-
4272 ber 31, 1907.

It is bad enough, I think, to take a period of one month comprised within the six months under consideration here, as applying to the Iron Mountain road. But to take another month nearly a year later, and on another railroad, and use that as a basis, it seems to me is using something that has not the slightest relation to the expenses it is sought to divide.

Q. I also call your attention to the fact that the month taken as a test in this case is not one of the months in the six months period here under consideration at all.

A. I have referred to that. It is nearly a year later than the close of this period.

Q. The statistics filed in these two cases show that the trans-state tonnage of the Cotton Belt road is forty-four percent of the total tonnage in tons, and sixty-five percent in ton miles. On the Iron Mountain the trans-state tonnage is thirty-five percent in tons of the total tons, and thirty-one percent in ton miles.

Now what does that indicate as to the similarity or dissimilarity of conditions of traffic on those two lines?

A. That indicates that the character of the traffic is quite different on the two lines. That would produce different operating conditions.

Of course, the Cotton Belt has sixty-five percent, which is almost two-thirds of its ton miles, as trans-state business, which would be hauled almost exclusively on through trains, leaving only thirty-five

percent of it, or a little over one-third as interstate and state
4273 business, to be divided between the through and local trains.

While on the Iron Mountain practically only one-half of the ton miles, fifty-one percent is trans-state business; leaving the other half to be divided between the through and local trains.

The character of the tonnage being so different, and the fuel and locomotive expenses and other expenses, especially those like fuel and locomotive expenses, so closely related to the traffic, would very likely be different. And the results obtained on the Cotton Belt in October, 1908 might be entirely different from those obtained on the Iron Mountain in the six months period ending December 31, 1907.

Q. Can it be correctly assumed that the results on one of those lines would be properly representative of the results on the other?

A. I should not think so. Not for any purpose which required any degree of accuracy at all.

Q. You have a knowledge of the character and equipment of those two roads, in a general way at least?

A. I don't know that I have.

Q. Do you know whether there is any difference in the equipment of the two lines or not?

A. You refer to cars and locomotives?

Q. Yes, operating equipment?

A. No, sir, I do not.

4274 Q. What effect would dissimilarity in the equipment of the two lines have on the expenses of the two roads?

A. It would have a marked effect. That is to say, if the Iron Mountain runs larger locomotives, which would be heavier, on its local trains than the Cotton Belt does, it would affect the proportions between the through and local expenses, making them dissimilar.

Q. And those differences would have to be shown and weighed in determining a proposition of that sort, would they not?

A. Yes, sir.

4275 Direct examination of FRANK NAY continued as follows:

By Col. MOORE:

Q. Mr. Nay, the next sub-division to which I call your attention is "engine house expenses": I wish you would examine that item in the division adopted by the State, and express your views in regard to it.

A. In the first place I think it is wrong to divide the expenses for a six months period on the basis of the expenses of the month of October, 1907.

I think the method of dividing the engine house expenses on the basis of engine miles is wrong, because the engine house expenses are not in proportion to the mileage made by the engines.

I have learned from the testimony in this case that the average run for through and local trains was obtained by dividing the runs at state lines.

4276 I would consider this to be wrong, and that the proper way to obtain the average local and through runs would be to take the entire run regardless if whether it crossed the state line or not. That would be the proper method of determining the relative runs of local and through engines. And when that was determined on that basis the result would be similar to a result that would be obtained by dividing the engine house expenses on the basis of the engines handled, which I think is the proper basis whenever it is desirable to determine a division of those expenses.

Q. The next item to which I want to call your attention is "Other train expenses", which you will find under "F" on page 6 of Exhibit K.

Please turn to that and state what you think of the manner in which that has been treated.

A. Under the head of "Other train expenses" I understand are included practically all of the casualty account, in fact, all of them except loss and damaged freight, crossing watchmen, flagmen, joint facility accounts, and accounts of that nature.

Q. What do you mean by casualties?

A. I mean injuries to persons, damage to property, stock killed and injured by trains on the right of way. I think that comprises all of the casualty accounts outside of lost and damaged baggage, which is a passenger account, and loss and damage to freight.

4277 It includes also floods?

A. Yes, sir. And clearing wrecks, too.

Q. Proceed with your statement Mr. Nay.

A. The train mileage has little to do with those accounts. The casualties do not occur with regularity; that is, with reference to the train mileage. It would seem that it would be possible to locate the most of those casualties, if an attempt had been made, to the trains, in an endeavor to divide them between local and through trains. But a division on a train mileage basis might, as a matter of coincidence, bring the correct result. I think, however, it would be simply a coincidence. It might bring a result very far from that which would represent the facts. I think a division on a train mileage basis between local and through would not, except it should be a coincidence, bring true results.

Q. Is that expense of such character that it can be distributed through a given period, or a series of months, on any system of averages—casualty losses, and things of that sort?

A. No, sir, not definitely. Of course from years of experience we learn that the casualties are within certain limits, maximum and minimum, and will run about the same; and railroad officials in them must provide for a certain expenditure of that amount.

Q. I understand that. That is for the purpose of making
4278 estimates, and things of that sort. But for the purpose of making a correct division, between local and through trains, such as is sought in this case, can you take any one month and say that it represents the ratio for any six months period?

A. As I have stated before, no one month is representative of a

period. It is not fair to consider any one month as representing an entire period.

There is another feature about these accounts which represent the erroneous division on a train mileage basis and that is that these accounts represent largely payments that are made during the month of October, 1907, but not the damages or losses or injuries that occurred during that month.

For instance, in the injuries to persons, in ordinary railroad practice of settlement, that would represent in very large part payments for injuries that occurred prior to the month in which the settlement was made.

And that is true of damage to property and damage to stock on right-of-way.

I think the charges for clearing wrecks would be practically current because that represents labor performed by the company's own force.

But the fact that these settlements are for business that occurred in prior months emphasizes the erroneous application of
4279 the train mileage of the month of October, in which very few of the damages probably did occur.

Q. Will you turn to sub-division G on the same page under heading "Loss and damage, freight" and state what you think about the method of dividing that.

A. Almost the same objection applies to that as to the previous one; with regard to the dates of payment.

Here the State's witnesses have separated the actual payments in one month, October, 1907, which should not be taken as representing the entire period, between state and interstate freight, as I understand it, according to the nature of the shipments, whether they were state or interstate, that sustained these damages or losses.

Those claims that were settled during October 1907 and charged to this account in that month represented damages and losses that occurred very largely prior to that month, and emphasizes the fact that no one month can be taken as representative. The number of interstate settlements made in October might have been largely in cases of the ordinary number settled from month to month; but the reverse might have been true.

I do not think any reliance can be placed on the figures produced under this head, as representative of the conditions that prevailed during the entire period.

Q. I will call your attention to the item "Total Operating
4280 Expenses" which seems to be an explanation of the method adopted by the State's accountants.

A. The total operating expenses, or, rather, this heading in the exhibit, simply explains how the total of train cost in the state and interstate have been arrived at.

Under this heading it is proposed to include everything pertaining to the direct cost of moving freight trains, with all expenses incident to such movement.

The first item under this heading is "Maintenance of Way and Structures" and, as I have already said, a very large proportion of

the expenses under that head do not relate to the direct cost of the movement of freight trains, nor expenses incident to such movement, because perhaps ninety per cent of the maintenance of way and structures expense is due to deterioration and the action of the elements, and is incurred from time to time without regard to the number of trains that are operated over the track.

Furthermore, those expenses under maintenance of way and structures which do have some relation to the movement of trains and cars, are expenses made necessary by the wear and tear, or deterioration for previous periods running back over many years.

The rails are renewed because of the wear and tear that has occurred in past years. In some cases it is thirty years or
4281 more, and in some cases it is only a few years, according to the density of the traffic handled over the rails.

And so with the ties; they are renewed and those that were renewed in October, 1907, were renewed because of the deterioration from the traffic in past years, and not because of the train or car mileage during that month.

Of course when it comes to buildings, sub-structure of bridges, fences, telegraph lines, coaling stations, water tanks, and things of that sort, the expenditure for maintenance of those have nothing to do directly with the movement of trains or cars.

Q. Under the heading "Method of dividing train cost" (Page 7 of this exhibit) the State's accountants have made an application of the sub-divisions preceding that, to the six months' business: look at that, please, and state what you think of the method adopted there.

A. The State has again used the month of October, 1907, but has made a variation under this heading which is applied to a very large amount of money, and instead of using the two percentages for the month of October, 1907 (as in, I think, all of the other accounts) a modified percentage has been used which produces a percentage of twenty-six per cent for local trains, based on ton miles, instead of 28.51 per cent for local trains, which is the October, 1907, percentage.

Q. This 26 per cent you mean is applied to the six months
4282 business?

A. It is applied in a way. That is to say, the State has assumed that exactly the same percentage of state and interstate freight would be handled on local and through trains during the entire six months as during the month of October, 1907. And on that assumption, by applying those percentages to the state and interstate trains one mile for the six months, has arrived at the result that twenty-six per cent of the total tons one mile on local trains is intrastate freight; whereas the test made by the witnesses for the state in the month of October, 1907, showed that 28.57 per cent of the total tons one mile transported on local trains was interstate freight.

This percentage is based on the assumption that the relative proportion of tons one mile, state and interstate on through and local trains, is exactly the same during the six months as during October,

1907; which I think is wrong, because October is the heaviest month of the year for all Southwestern roads; it is the big cotton month and practically all cotton shipments are interstate shipments.

My judgment would be, based on a good many years' experience with Arkansas conditions, that the proportion of intra-state tonnage to interstate tonnage in October would be less than during the entire six months, or during an entire year, for the reason that
4283 there is an excess of interstate tonnage or shipments handled during that month.

But supposing this percentage were actual, practically all of the objections to the ton mile basis that have been mentioned heretofore (and which I do not think it is necessary to repeat now and burden the record) would apply to this division on the ton mile basis.

Q. The accountants for the state have used, you stated a moment ago, the October statistics for the purpose of dividing the expense under all the sub-divisions made by them, which appear on Exhibit J.

For instance, maintenance of way and structures, involving five hundred and fifty-three thousand and odd dollars, have been divided between local and through trains on the basis of the statistics for that month.

The same is true of maintenance of equipment which amounts to something over seven hundred thousand dollars.

All the way through where they have made a division between local and through trains, that has been the method.

Now the percentages of state and interstate tonnage on those trains, as shown by the October, 1907, statistics, is something over twenty-eight per cent of interstate tonnage on local trains.

In that single instance they have abandoned the methods used by them in all their sub-divisions, as described by you a
4284 little while ago, and in this one instance have adopted a new factor, using twenty-six per cent. Is that correct?

A. Yes, sir.

Q. Is such a method as that fair or consistent?

A. I do not think so. That is, I do not think it is fair to use such a method and have it purport to represent true conditions. I was going to call attention to the fact that this same thing applies to the freight on through trains.

Exhibit I shows the proportion of intrastate freight handled on through trains to be 5.59 per cent. While the percentage used by this method I have described as applied to the division of the through train expenses is 4.96 per cent, a difference of .63 per cent; but when applied to a large amount like $1.948,689.55 it will make a very substantial difference in the final result.

There is in each class, both local and through trains, state and interstate used in Exhibit K, substantially less than in the October business as shown in Exhibit I. And the result of that is to reduce the proportion assigned to intrastate traffic and increase the proportion assigned to interstate traffic. That is, to reduce it compared

with what it would have been if the two October percentages had been applied, as in the other cases.

4285 Q. And it reduces it to the extent of those percentages?

A. Yes, sir.

Q. In one case from 28.51 to 26, and in the other case from 5.59 to 4.96?

A. Yes, sir.

Q. And such a change in the method as that would produce a difference in the result of course, as you have just referred to?

A. Yes, sir.

Q. After having ascertained, in the manner indicated by what we have gone over, the relative cost of local and through trains, of the freight carried on each kind, the State has undertaken to divide that expense on a ton mile basis ratably between state and interstate freights: I want to know what your views are as to the correctness of that method of ascertaining the relative cost of conducting state and interstate business.

A. I think that the method is erroneous because it makes no distinction between the different kinds of freight, principally car load and less than car load.

The expense of hauling a given number of tons of car load freight is less than the expense of hauling the same number of tons of less than car load freight the same distance.

That is a distinction which is generally recognized in cost
4286 accounting and in the rates that are charged for the service.

One reason that the rates are less for car load freight is that the cost of the service per unit per ton mile is less on car load freight than on less than car load freight.

The ordinary ton mile basis makes no provision for a difference in the length of the haul. An attempt has been made here to provide in a measure for the difference in the length of the haul by a method of apportioning terminal expenses. I do not think it is adequate, because, as stated in connection with station expenses, they are stated on a ton basis, car loads and less than car loads all thrown together.

The lump expenses are divided on a ton mile basis, regardless of whether the cars contained a heavy load of car load freight or are lightly loaded with merchandise.

Also regardless of whether the cars are actually handled by the switch engines, or whether they are switched to a great distance.

Also regardless of whether the freight is actually handled by the Company's employees, or by the shipper and consignees.

Those are the principal conditions that make the ton mile basis an erroneous basis for dividing expenses between state and interstate.

Q. Does the difference in the cost of operating local and
4287 through trains contain all the elements of increased cost of handling intrastate over interstate business, or are there other elements outside of those?

A. There are other elements outside of the train cost.

Q. You mentioned a while ago the subject of long and short haul: is the difference between the cost of handling the two classes

of freight, state and interstate, correct, even if they were covered by an allowance in the train expense? Or, are there other elements and considerations in that which would have to be considered in determining the exact difference in the cost of handling freight, such as the long and the short haul and the difference in the character of the freight handled, and so on?

A. There are other elements for which allowance should be made. Allowance has not been made for the difference in the long and the short haul.

No allowance has been made for the difference in the character of freight, such as less than car load freight, high class expensive freight, as compared with low class and less expensive freight to handle.

Q. Take freight such as merchandise, car load and less than car load, hauled on the local trains: I know there is a much larger proportion of the less than car load freight hauled on the local trains than is hauled on the through trains (I mean

4288 State freight).

Does a division on a straight ton mile basis make proper allowance for that part of the state tonnage which is less than car load? Is it proper to divide that on the same basis that you divide the car load, and put the merchandise, high grade commodities, on the same plane with the lower grade commodities, in dividing those expenses on a ton mile basis, as they have?

A. No, sir, it is not. And the exhibits in this case I think show it is a fact that the greater percentage of the total tons and tons one mile for state business consist of merchandise or less than car load shipments than for interstate business.

In the case of the tons, my recollection is that the percentage of less than car load intrastate is nearly double the percentage of less than car load interstate.

Of course the less than car load freight, while it is relatively a small proportion in tons, incurs a large proportion of the expense. That is, a much larger proportion than its proportion in tons, because the less than car load freight is the more expensive freight to handle.

Q. In this connection, Exhibit N, I think shows it cost about 86 per cent more on the ton mile basis to handle state freight than interstate: I wish you would look at that and see what it is.

Every operating man who has testified in this case has put

4289 the minimum difference at three times as much. It runs from three times to six times as much for the cost of transporting state freight than interstate. In view of that testimony I wish you would look at that exhibit and state what you think of his method of division.

A. I have made a computation by dividing the state tons one mile into the state operating expenses as shown on Exhibit N, and the same compilation for the interstate tons one mile, and expenses. I find that the result of this exhibit is to show the cost of state business to be 86 per cent more on a ton mile basis than for interstate business.

The average operating expenses per ton mile for state business is 8.2 per cent and for interstate 4.4 per cent, a difference of 3.8 per cent—or 86 per cent.

I heard the testimony of some of these same witnesses in the Missouri Rate case and it was to the effect that the extra cost of state over interstate business on a ton mile basis would vary from ten per cent minimum, to sixty per cent maximum.

Now, this compilation presented here, which is complicated and produces a result which shown 86 per cent increased cost, indicates that the state's witnesses realized that they were mistaken in the Missouri Rate case in putting the extra cost so low. But it is still below what the railroad operating men testified to.

4290 I made a further computation with regard to the cost on a revenue basis, and found that by dividing the state revenue into the state expenses, and the interstate revenue into the interstate expenses, it produced a result which shows that the state traffic on a revenue basis is less expensive than the interstate traffic.

The average cost to earn one dollar on state traffic (I am referring now to operating expenses) is sixty cents; and the average cost to earn one dollar on interstate traffic, under this method, is sixty-three cents.

I have listened to the testimony in many rate cases and I have never heard an experienced man testify that it cost less to earn one dollar in state traffic than to earn one dollar in interstate traffic.

Q. Mr. Nay, on page 8 of Exhibit K, under the head of "Miscellaneous Revenue etc" the State's accountants have divided miscellaneous revenue on the basis of the direct earnings, state and interstate. Do you think that method of division is proper? Should the state and interstate revenue be divided on that basis? It amounts to $152,814.41.

I do not know that your attention has been called to that, but in order to refresh your memory I will state that some testimony has been introduced about it. The railroads do not attempt to divide it and their accountants have testified it cannot be divided on that basis. I want to get your views about that.

4291 A. Very frequently we have had that question up. I think one of the largest items that occurs under that head—I have not seen the details of that—but at any rate usually one of the largest items is switching.

Q. Wait a moment and I will show it to you.

A. I will go ahead with the switching until you find that.

We have found it impossible to make a separation of switching because the road that performs the switching does not know whether the shipment is a state or an interstate shipment. A great deal of this switching is collected from other roads, where, for example, if the Cotton Belt should bring a car into Little Rock destined to an industry located on the Rock Island tracks, the Rock Island would switch that car to the industry, but we would simply get a switching order "Switch car number so and so to such and such an industry." The Rock Island would not know whether or not that car contained

an interstate shipment and it would be impossible for us to make a separation between state and interstate.

For that reason the miscellaneous revenue in these cases where we endeavor to get at the facts as nearly as possible, has been treated separately, and we have not divided it between state and interstate, but have treated it as a whole and set aside a revenue proportion of the expense to apply to the miscellaneous revenue.

4292 The next large item is car service. That is demurrage, as it is commonly known, assessed on cars for delay in unloading. Of course if it could be considered as a part of the consideration for those shipments it would be possible to separate that according to the cars on which the demurrage occurred. But if it is simply considered as storage for the tracks it is a question then as to how it should be separated. That is the reason that in our preparation for these cases we have not attempted to make the separation.

The next large item is rents of buildings and other property. Practically the same thing will apply to that as to demurrage, because demurrage is equivalent to rent of the facilities for storing the cars during a given time; and the same difficulties appear there as to a separation between state and interstate.

In fact, I think it is impossible, and doubtless the state's witnesses have found it impossible, to make an actual separation; and that is why they have omitted the relative state and interstate proportion.

Q. Under the same heading (page 8 of Exhibit N) you will find $179,191.00 for hire of equipment: state your views about that.

A. That item "Hire of equipment" is made up of two elements: one the hire of cars belonging to other railroads and Companies while they are on the Iron Mountain Road; and the other is the

4293 amount received by the Missouri Pacific System or the Iron Mountain Road for the hire of its cars while they are off the line.

The testimony I have heard in connection with all these rate cases whenever it touched on these points, was, that the cars were delayed much more in the state traffic, or local traffic, if they were referring to local trains, than in the interstate or through traffic.

I have seen various estimates as to the difference in the delay, I think running as high as twelve or fifteen times the delay to cars in connection with state traffic as in through traffic.

Of course the difference in the length of haul for the two kinds of traffic makes it very evident there must be increased delay, at least in proportion to the increase in the length of the haul.

That would apply only to the debit end of this account, because neither state nor interstate traffic has anything to do with the amounts collected from the several carriers, while the cars of the Iron Mountain Company are on other roads.

So I think this method of division for hire of equipment which simply takes the balance and divides it on a revenue basis, without any allowance at all, produces an injustice to the intrastate traffic, because it does not assign enough to that traffic.

4294 Q. There should be allowance to cover the increased use, growing out of demurrage and so on?

A. Yes, sir.

Q. Mr. Nay, I want to call your attention next to the apportionment of passenger expenses made on Exhibit M (introduced by Mr. Wharton in this case): you have examined Exhibit M, have you?

A. Yes, sir.

Q. The State has adopted a different method of making that division and seems to divide it between different classes of cars without regard to trains: I would like to know, in a general way, what you think with reference to the methods that have been adopted by the State for that purpose.

A. In making this passenger division the percentages have been based, I think throughout, on the month of October, 1907, to which the same objection applies as in connection with the division of the freight business. No one month can be taken as representative of a long period, six months or a year; and the division throughout has been largely on the basis of car miles, which I think is inaccurate in many cases because many expenses are divided on a car mile basis, which have little or no relation to the car miles of the trains, or are governed by the car miles. Again, the car miles in local trains, which carry no Pullman cars, are treated just the same as those in through trains which do carry Pullman cars; and that
4295 works an inaccuracy, because it does not assign a sufficient proportion of the expense to the traffic carried in local trains, although no division has been attempted here between through and local.

It seems to me, to be consistent, the same division should have been adopted here between through and local as in connection with the freight, because there are through and local passenger trains, just as distinctive as through and local freight trains.

The reason given for not separating the through and local passenger trains was that practically all of the through trains do the local business.

That is true also of freight trains and I think there is an inconsistency in the method in not separating the pasenger expense between through and local, the same as they did in connection with the freight expenses.

The first item under this head is "Maintenance of Way and Structures." As stated in connection with the freight proportion of this expense, perhaps ninety per cent are not governed by the car miles, or have little to do with the car miles.

The reasons stated on this account in connection with the freight service all apply to the passenger traffic with equal force. That is to say, the expense is caused by deterioration, by the action of the elements, and not by the car miles; and that the expense is incurred by reason of wear and tear and deteriora-
4296 tion that occured in prior months and not during the month of October, 1907, and not during this period.

Then again, even as to that proportion of the expense (which is small) that is affected by the car miles; it is not fair to consider an express car on a parity with the coaches and Pullman cars.

An express car is simply a very substantially built freight car

which they run in passenger trains. It has eight wheels under it, while practically all of the Pullmans have twelve wheels and many of the passenger cars have twelve wheels.

Q. Then there is a difference in weight, isn't there?

A. Yes, sir, there is a marked difference in the weight of the cars themselves. The Pullman cars and parlor cars, chair cars and the coaches of the Company being heavier than the express cars.

And the weight has a great deal to do with the maintenance of way expenses, because we know from experience that it is frequently necessary to substantially strengthen bridges and put the track in better condition to accommodate heavier equipment.

It is, however, frequently the case that large expenses are incurred solely because of the operation of heavier equipment. The facilities would have been adequate for handling the traffic in lighter
4297 equipment.

For all these reasons I think the division of expense for maintenance of way and structures, the passenger proportion, on a car mileage basis, among the four classes, namely, coach, pullman, mail and express, and especially for one month only, will not produce results that can be relied upon as representing actual conditions.

As to maintenance of equipment, the repairs to locomotives have been divided again among the four classes of passenger train cars on a car mileage basis, while it seems to me there is very little relation between the mileage made by these cars and the repairs to the locomotives.

This is especially true because the repairs made to the locomotives during the month of October, 1907, are those caused by wear and tear during a previous period; and even if there was a relation between the car miles (which I think there is not) and the repairs to locomotives, it would be unfair to divide these repairs caused by wear and tear over perhaps a preceding year, on the basis of the miles made in one month, the month of October, 1907.

This emphasizes, I think, very strongly the objection to using percentages based on any one month.

Another injustice that is worked in connection with repairs to locomotives on this basis of division may be illustrated as follows:

4298 Suppose two trains, one a local passenger train, and the other a through passenger train; the through passenger train consisting of nine cars, three of which are coaches; and the local train consisting of four cars, three of which are coaches. Suppose the repairs to the two locomotives will average the same, for example $2,400.00 per annum.

The total expense of the engine pulling the local train should be charged to local service, namely, $2,400.00 per annum.

If that were divided under the State's plan, three-fourths thereof, or $1,800.00 would be allotted to coach service.

On the other, or through train, using the State's plan, one third of the total expense, or $800.00 would be assigned to coach service; making a total of $1800.00, plus $800.00, or $2,600.00, assigned to coach service for repairs to locomotives; providing the local and

through trains had been computed separately, and the State's plan of dividing on a car mileage basis had been used.

However, using the State's plan of combining the two trains, we would have a total of repairs to locomotives of $4800.00, a total of thirteen cars in the two trains, of which six would be coaches and six-thirteenths of $4800.00 would be assigned to the coach cost of repairs to locomotives, which would be about $2200.00, as against $2600.00, which would have been assigned if the local and
4299 through trains had been computed separately.

Of course I am supposing that these two runs are of equal length and that the car mileage would be in the same proportion as the number of cars in the train, which would be the case if the two runs were of the same length.

This shows that the State by abandoning the plan followed in connection with freight service of dividing the expenses between through and local, has relieved the intrastate expenses of charges that would have gone thereto if they had followed the division between through and local in connection with the passenger service.

Q. Should there be any difference made in the cars on local and through trains on account of the more frequent starts and stops of the local as compared with the through trains.

I don't know about that and I want to call your attention to it.

A. I should think there would be because it has been testified by operating men that starting and stopping causes more wear and tear, or damage, that subsequently must require expenditure for repairs, than straight running on the track.

Q. If that is true, and if it is also true, as has been shown in this case, that the local trains carry a large preponderance of the state passengers, would not the disregard of that element work an
4300 injustice to the local service?

A. Yes, sir. That is, it would fail to charge a sufficient proportion of the repairs to the traffic hauled in local service.

In a division of the expense of maintenance of passenger train cars, the Pullman cars are omitted, and the expense is divided among the three classes, namely, coaches, mail and express cars on the basis of the mileage of those cars during one month, October, 1907.

The same objection applies here, that the repairs were made necessary by wear and tear during previous months and that no one month should be taken as representative either of the repairs or of the mileage made by the cars.

This basis assumes it costs just the same per car mile to repair a coach as it does to repair an express car; while as a matter of fact it costs considerably more. Some men have estimated the cost at double for repairing coaches as to repairing express cars. No allowance has been made for this excess cost.

Q. Now go to the traffic expenses, please.

A. The traffic expenses have been divided on the gross earnings basis, which assigns to mail and express traffic 19.33 percent of the total traffic expenses.

The traffic officials, whose salaries and expenses are included under

this head, have practically nothing to do with either the mail
4301 or express service.

I am speaking of the common practice among railroads, and I am informed that the Iron Mountain is no different in that respect.

The contracts for express service in nearly every case made by the executive officials, usually by the President of the Company, or some one higher in authority, and are turned over to the operating officials to be executed. The accounting department looking after the proper revenue to be received from the Express Company.

The mail service is not covered by contracts, the United States Government determining the rate of mail pay, and the operating officials and their forces attend to the carrying of the mail under the conditions prescribed by the Government.

Q. "Salaries and expenses": Is that expense which I think has been described by the traffic men in this case as efforts to work up business, advertising, foreign agencies and things of that sort.

Isn't that solely and exclusively for the purpose of securing freight and passenger traffic? Do the railroads in any case employ traffic men to work up the express business or get up mail contracts? Did you ever hear of such an application of their talent as that?

A. No, sir. The expenses under this head are simply
4302 the passenger proportion of expenses and would not include any freight.

Q. I know that, but I am speaking of it under the broad term in which it has been used in this case. Is there any conceivable reason why twenty percent of that expense, practically, should be charged to mail and express?

A. No, sir.

Q. What were you going to say about miscellaneous?

A. I was going to say there is another class of miscellaneous passenger revenue, speaking of mail and express as miscellaneous for the present. That is such as "excess baggage" with which the traffic men do have something to do; these men whose salaries and expenses are carried under this head, prescribe the rates for excess baggage and provide for the excess baggage checks, and things of that kind.

But the miscellaneous passenger revenue has been omitted from this division. I think while they do have something to do with that miscellaneous passenger revenue, their duties in connection with it are not sufficient to entitle it to be included. But, if that is omitted, certainly the mail and express should also be omitted, because these men have less to do with the mail and express traffic than they have to do with the miscellaneous passenger traffic which has been omitted.

Q. In getting at this thing on the basis of actual facts, the State's accountants have, in this instance, really omitted the only
4303 item of miscellaneous expense which could reasonably be brought into this account; and have brought into it these two items of mail and express which have no relation whatever to it, have they not?

A. Yes, sir. Speaking of actual facts, I do not think there is any

result in this division, from start to finish that represents an actual fact.

Q. The next heading I believe is "Transportation Expenses": Take that up next please.

A. This exhibit shows that the station expenses under the heading of "Transportation Expenses" have been divided on the basis of the number of passenger of each class handled, after making allowance of ten cents per day for handling mail at certain stations.

Q. There is an assumption there, isn't there?

A. Yes, sir. "Assuming that each intrastate passenger makes use of two terminals, and each interstate passenger makes use of one terminal"—and then the division is made by doubling the number of intrastate passengers.

While this assigns a large portion of the expenses to intrastate traffic I don't think it assigns a sufficient proportion, because the trans-state traffic has not been allowed for, and the trans-state passengers would make no use of the terminals in the State of Arkansas.

Q. The State's accountants make no allowance on that
4304 account?

A. No, sir.

Q. That is a small matter, but at the same time, if the accountants who prepared this exhibit were basing it on actual facts, they should have taken that into account, should they not?

A. Yes, sir.

Q. "Yard and train expenses" I believe is the next item.

A. Yes, sir. This sub-division of the transportation expenses is made on the basis of the mileage of the four classes of passenger train cars for the one month of October 1907; and the same objection would apply here as mentioned under the head of repairs to locomotives, so far as being unfair to the traffic—that is, not allowing a sufficient expense to the traffic carried in local trains.

This might be illustrated as follows: take a local train with three cars and a local run of one hundred miles; the local miles would be three hundred. Then take a through train of nine cars and suppose the through run to be two hundred miles, the car miles would be eighteen hundred; making a total for the two trains combined of twenty-one hundred car miles. The local train's car mileage would be 14.3 percent of the total; and the through train's car mileage would be 85.7 percent of the total.

4305 Assume the wages of the crew running the local train to be $25.00; and of the crew running the through train to be $40.00; we would then have total wages of $65.00, $25.00 of which actually was incurred in connection with the local train, and $40.00 of which was actually incurred in the operation of the through train; which would have been the amount assigned to the local service, which carries the greater portion of the local traffic, if the local and through has been kept separately, as was done in connection with the freight traffic. But now, by combining them, and dividing the total wages of $65.00 on a car mileage basis, will assign to the local run 14.3 percent of $65.00, of $11.30 as against $25.00, the estimated

amount actually paid; and to the through train $57.70, as against the $40.00 estimated to be actually paid.

This illustration is used to show that the abandonment of the division between through and local in connection with passenger service has the effect of reducing the expenses applied to the traffic carried in local trains, the greater proportion of which is state traffic.

Furthermore, this division of the train expenses on a car mileage basis assumes that the wages of the train crew which runs a train of nine cars are exactly three times the wages of a train crew which runs a train of three cars.

Of course that is an absurdity, because the wages of con-
4306 ductors and brakemen, engineers and firemen, and other train men, are not based on the number of cars in the train, but are usually based on the number of miles the train runs or on a fixed rate per month. And the wages of the crews on the local passenger trains are greater per train mile than the wages of the crews on the through trains.

So that the division of the wages, even if it were made on a train mile basis between local and through would not assign a sufficient proportion to the local train. And a division on a car mile basis much less assigns a sufficient proportion to the local trains, because there are more cars in the through trains than in the local trains; and as the local trains carry the larger proportion of the state business, the result of this method is to assign to the interstate traffic too great a proportion of this train and yard expense, and too small a proportion to the state traffic.

Q. Does not yard and train expense include the cleaning of cars, Mr. Nay?

A. Yes, sir, it includes the cleaning and care of cars.

Q. Is there any comparison between the cost of cleaning coach, Pullman, mail and express cars? Can that be properly divided on a car mile basis?

A. No, sir. The cost of cleaning coaches and Pullman cars is very much in excess of the cost of cleaning mail and express cars.
4307 A division of that expense on a car mileage basis is not fair. This also includes the cost of supplies, such as ice, water, and lighting. The cost of those supplies for coaches would be greater than for mail and express cars.

Q. Are not the coaches cleaned at the end of every run, whether a short run or a long run, so the length of the run has no connection with the cost of cleaning?

A. Yes it is true that a coach is cleaned at the end of a run; so if a coach makes a 500 mile run it is cleaned at the end of a run; and if it makes a 200 mile run it is cleaned at the end of the run. Therefore, that expense is not in proportion to the car miles.

Q. I notice a division of expense for loss and damage, which is a small amount, but inasmuch as the State assumes it has done these things on an actual basis, and has attained accuracy, I will ask you to look into that.

I see they have divided the actual expense between interstate and

intrastate business in proportion to gross earnings. But they have made no allowance on account of local or state business:

What do you think of dividing that in that way, without making any allowance in favor of the local or state business?

A. I think there should be an allowance made for excess
4308 cost of intrastate over interstate business, which has not been made.

Q. Explain why you think that should be made, if you please.

A. Because the loss or damage to baggage occurs through the handling, either the unloading or loading, or trucking at stations, and the baggage handled on the intrastate movements would be handled oftener, loaded oftener, unloaded oftener, and handled at stations oftener. For that reason the loss or damage would be greater in connection with state traffic than with interstate.

Q. I understand there is a larger quantity of baggage carried on through trains, and that interstate passengers carry more baggage, perhaps, than local passengers. But the ratio of loss and damage from the causes you have mentioned is larger in the local service, the state service, than it is in the interstate service, on account of the greater frequency of handling; and it is on that account that you think the allowance should be made?

A. Yes, but I don't believe it is true that the through trains carry more baggage in proportion to revenue than the local trains.

Q. State what your understanding about that is.

A. That used to be the impression, I think, until some investigations were made and it was found that the local or state trains carry more baggage in proportion to the revenue than the through
4309 trains; because much of this local, state business, consists of traveling men, drummers who have large sample cases. While if you go to a station and see a man taking the through train from Chicago to Kansas City, for instance, he will have his grip in his hand; it is not put in as baggage. It is only when people are going for a long journey or for a protracted stay that they take a trunk which goes into the baggage car.

In connection with the Missouri rate case, after hearing part of the testimony in that case, I had an investigation made on certain portions of our line as to the actual amount of baggage checks issued at a large number of stations. The result was that there were more baggage checks issued for state traffic than for interstate traffic.

Q. That is, the proportion of loss and damage to the revenue received is greater in the state than in the interstate business?

A. Yes, sir, because of the additional handlings. A passenger buys a ticket or presents mileage, and he has three or four sample cases and rides 25 miles. That baggage is handled twice at the station and once on the train, making three handlings.

Another, passenger boards the train, say at St. Louis, and buys a ticket to Texarkana and pays—I don't know what the rate is, but suppose it is $10.00. That baggage receives the same number
4310 of handlings as in the case of the man who paid seventy-five cents.

So it makes the causes that produced the damage to baggage much

greater in proportion to revenue on the local trains than on the through trains.

Q. Under the head of "Total operating expenses" the State has made an explanation of the methods used by them in the division of passenger expenses: look at them and see if there is any comment you wish to make in connection with it.

A. Exhibit L, as I understand it, is an explanation where these various items mentioned in Exhibit M have been summarised and totals made for what purport to be train cost under coach and Pullman, and "other costs, state and interstate"; and another heading "Train and other costs, mail and express". And then "Total".

Q. I notice they state in that explanation that the amounts charged to state and interstate are expenses not chargeable to train service; would not that properly include maintenance of way and structures, and in that view should not maintenance of way and structures be charged to state and interstate rather than as they have divided it?

A. The same remarks would apply there as made in connection with the freight service.

The cost of maintenance of way has been treated as an
4311 expense directly in connection with or attributable to the train cost. I do not think it properly belongs under that head.

Q. The point is, that to the extent to which that is not properly a train cost, and it does not grow out of operation, it should not be treated as a train cost.

A. No, sir, it should not.

Q. Under the next sub-head division, "Cost of Pullman service" between state and interstate business, they have divided between intrastate and interstate in proportion to the passenger miles of each class of traffic. And then below that they have made a separate accounting with regard to Pullman service:

Just take that up, Mr. Nay, and explain the effect of that division.

A. All of the figures used to arrive at this coach service have been estimated, and the sum of all these estimates or approximations are now divided between state and interstate traffic on the basis of the passengers one mile.

Now, if these expenses had been actually ascertained instead of being estimated, a division on the basis of passengers one mile would be unfair, because proper allowance has not been made for the difference in the length of the hauls, the long and short hauls, such as additional expense incurred by frequent stops, etc., items that
4312 have been mentioned.

Besides that, there is included in the figures passengers one mile on which the percentages for dividing the coach expense are based; the passengers one mile hauled in Pullman cars. That is to say, a separation has been made between the coach and Pullman expense, but the separation has not been made between the passengers one mile hauled in coaches and in Pullman cars; but the entire passengers one mile hauled in both kinds of cars have been applied to the division of the estimated expense of the coach proportion.

This is unfair, because the State assumes that only twenty-five per cent of the passengers one mile hauled in Pullman cars are State

passengers. That percentage I would consider to be large. But supposing that is true, if the passengers hauled one mile in Pullman cars had been deducted, the result would have been a very large reduction in the passengers hauled one mile, interstate. That is, seventy-five per cent of those passengers hauled one mile interstate would have been deducted from the interstate passengers, and only twenty-five per cent from the State passengers one mile; and that result would have produced percentages which would have assigned a much greater proportion of this estimated amount for coach expenses to intrastate than has been assigned by the method used here.

It is erroneous to apply the entire passengers one mile in
4313 both coach and Pullman service to the strictly coach service, and then apply a different percentage to the Pullman expense.

Q. This 73,842,620 passenger miles is divided on the basis of 58.71 intrastate, and 41.29 interstate, and includes all Pullman passengers as well as coach passengers, does it not?

A. Yes, sir.

Q. And that total expense of $896,378 is divided between them on the basis of passenger miles of each class of service?

A. Yes, sir, that expense is divided on the basis of the passenger miles that were transported in both coaches and Pullman cars.

Q. And yet they have in the estimate that follows that, separated the Pullman, and estimated it on the basis of 75 per cent interstate passengers and 25 per cent state passengers in those cars?

A. Yes, sir.

Q. That is very far from a division on the basis of actual facts is it not?

A. Yes, sir, that is erroneous absolutely.

Q. And it involves a pretty large amount?

A. This method of division transfers a large amount from the intrastate to the interstate column, which would be in the intra-
4314 state column if divided on the basis of passengers one mile in the two kinds of service, considered separately.

Q. That item covers a very large aggregate, in the neighborhood of nearly one million dollars?

A. It covers over one half of the total passenger expenses, $896,000 out of $1,678,000.

Q. I want to know if that result was obtained on the basis of facts actually obtained, as is claimed.

Judge HILL: We do not claim it was all obtained on the basis of actual facts.

Col. MOORE: Let the testimony speak for itself.

A. This division is not based on an actual fact, because it divides the coach expense on the basis of passengers one mile transported in both kinds of cars, coaches and Pullman.

Q. I want to ask you if the items of which that is composed, which precedes it, was arrived at from actual facts or from approximations and assumptions.

A. The items that go to make up that expense are all on the basis of estimates.

Q. I see on page 5 of this Exhibit M the item "Miscellaneous revenue" divided between state and interstate business in proportion to the gross earnings of each class: I believe you stated a similar division of freight revenue was improper: what do you think about this?

4315 A. The division of that item between freight and passenger?

Q. The division of that between state and interstate business.

A. There are many items there which cannot be divided and of course this division on the basis of state and interstate business may or may not be right.

We felt that the difficulties in the separation of that were such that we would set aside this revenue and not attempt any division of it.

Q. You have explained that as regards the freight revenue: I wish to ask you if the same reasons apply to an attempted division of the passenger revenue.

A. Yes, they do.

Q. You have been over the exhibits now in detail, those relating to passenger as well as to freight traffic. You have given the matter some study, I see, from the statements you have made. I wish you would state what your judgment is in view of your experience in connection with such matters, as to the comparative merits of this system adopted by the State for dividing the expense between state and interstate business, and a division on the basis of revenue with proper allowance for any excess cost that may be incurred in conducting local or state traffic.

A. My judgment is that this method which has been used
4316 by the State, which is based on a series of approximations and which does not produce any actual results, either as to the division between through and local train service, or between state and interstate, or any of the other classes into which sub-divisions of expenses have been made; and then the final totals of these summaries being divided on a ton mile basis or passenger mile basis, cannot be relied upon as producing figures which represent actual conditions.

The ton mile basis has been used by the same witnesses in other cases as applied directly to the expenses. And the fact that the increased cost has been greatly enhanced in this division over what it was estimated to be by those same witnesses in the Missouri rate case, indicates that they have concluded they were mistaken, and have now adopted a method which approaches nearer to the method produced by the revenue basis.

It is conceded by every one familiar with conditions, that no accurate division can be made between state and interstate traffic; but certainly, the revenue basis with the merit of being based on rates which do consider the cost of the service—that is, the relative cost of the different kinds of service, such as high class traffic, low class traffic, car load and less than car load, long hauls and short hauls, all of which have been enumerated in my former testimony,

must certainly produce more nearly accurate results than any
4317 basis which involves a long series of approximations, some of which is even approximated on a ton mile or passenger mile basis.

In this connection I would like to make a little explanation concerning my former testimony on the revenue basis.

One of the witnesses for the state testified that I had set up a "snow man" and then knocked him down, because I had divided the expenses on the revenue basis and then said something else must be allowed for excess cost.

The witness apparently does not thoroughly understand the proposition in hand, or did not carefully consider his testimony regarding the "snow man." The revenue basis, which is the basis for dividing expenses on the revenue derived, based on rates which as has been said do take into consideration the relative costs of the different kinds of traffic, does not measure the entire excess cost inasmuch as the average revenue per ton per mile on state traffic is as much greater as the average revenue per ton per mile on interstate traffic, as the excess cost on state traffic per ton mile is greater than that of interstate traffic.

So that when the revenue basis is used and it is determined that the average revenue per ton per mile on state traffic is double that of the average revenue per ton per mile on interstate traffic, the revenue basis does allow for an increased cost of one hundred per cent, on a ton mile basis.

4318 When operating officials of long experience, who are thoroughly familiar with local conditions, testify that the increased cost of handling state or local business over interstate or through business is from three to seven times as much, they refer not to the revenue but to the traffic itself, which would be represented by ton miles. And if from their testimony it should be said that the state traffic costs four times as much as interstate, and it should be found that the average revenue per ton per mile is twice as much per ton per mile on state as interstate, then after a division has been made on the revenue basis, in such a case the allowance of one hundred per cent increase cost, or twice the cost of state traffic over interstate traffic is inadequate, and the additional excess cost must be added to conform to the testimony of the experienced operating men who have first hand knowledge of the actual cost.

For that reason the additional excess must be allowed when the testimony shows that the actual excess is greater than the excess of the average revenue per ton mile on state traffic over interstate traffic.

So there is no setting up of a "snow man" or knocking him down either, but simply supplementing the revenue basis by adding excess cost, based on the testimony of experienced railroad men.

I desired to make this explanation, fearing the matter was
4319 not thoroughly understood; and in order that the Court might understand just what my position is with regard to the revenue basis and its merits.

Q. According to the views expressed by you just now as I understand them, if there should be an increase or diminution in state or

interstate rates, which would affect the revenue per ton per mile, it would not, when you attempt to adjust the difference in cost upon the basis of its costing so much more to conduct one class of business over the other, on the basis of ton miles, affect the result of the application of the revenue theory at all, if the revenue derived from the State business per ton per mile was double that derived from the interstate business, and it cost four times as much. You would make proper allowance, as I understand you, with reference to the ton mile basis of increase, after you had made proper allowance for that additional revenue; and if it should fluctuate one way or the other it would simply affect that supplemental allowance to be made: is that correct?

A. What I intended to say was that this supplemental allowance should fluctuate in accordance with the fluctuation in the revenue. That is on the principle that if a man is manufacturing different kinds of machines, and one costs three times as much as the other, he would sell the one that costs three times as much for three
4320 times the price, in order to produce the same percentage of profit.

4321 FRANK E. WARD—Recalled, testified as follows:

Direct examination.

By Col. MOORE:

Q. You have been sworn before and have testified before in this case?

A. Yes sir.

Q. You stated in your former examination what your experience in railroad operation had been, I believe?

A. Yes, sir.

Q. The State, for the purpose of determining the relative expense of transporting State and interstate freight, has attempted to ascertain the cost of operating local and through trains, and
4322 the amount of state and interstate freight in ton miles carried on each class of trains. They have taken the month of October, 1907, as representative of the six months including July to December of that year.

They first attempted to ascertain the state and interstate freight carried on each class of trains, that is, the local and through trains, during that month, by taking the wheel reports and way bills of freight carried on local trains during that month, and deducting that from the total ton miles taken into account during that month by the auditor, whose basis disregards the actual movement of freight. These accounts do not represent business which actually moved in the month of October, but are made up as follows:

System business, which covers shipments moving between stations on the Missouri Pacific System, which includes the Iron Mountain, is taken into account on what is known as "The forwarded basis";

Interline business, representing shipments covered by way bills to or from points on other railroads, is divided into three classes, as follows:

"Interline forwarded", "Interline received" and "Interline through or overhead".

They next attempt to divide and apportion the relative expense of local and through trains on the method adopted in the formula filed in this case as "Exhibit K", and, after having ascertained
4323 the expense of each class of train in that manner, they apportioned it between the state and interstate freight carried on the local and through trains, respectively, on a straight ton mile basis.

You have made some examination and study of Exhibit K, have you not?

A. I have.

Judge HILL: Do you mean that statement you have read to the witness is a summary of the testimony thus far, or is it a summary of what you expect to prove?

Mr. MOORE: I state that as a summary of my understanding of the theory adopted by the State.

Judge HILL: It is a very incorrect summary, then.

Col. MOORE: I do not think there is anything in it that has not been covered by the evidence in the case.

Judge HILL: If you wish to submit that to him as a hypothetical case you expect to prove hereafter, I have no objection; but if you submit it as a statement of the evidence, I wish to object to it.

Col. MOORE:

Q. I will assume, for the purposes of the question, that the facts I have stated are proven, or will be proven. Upon that assumption, Mr. Ward, I wish you to state your views, as an operating man, of the correctness of the State's method of separating and apportioning the expense of transporting state and interstate freight.
4324 A. In my opinion, such a method as you have outlined would not be accurate and reliable for the purpose of accomplishing the object sought.

In the first place, the taking of any one month would not, in my opinion, be safe for determining so important a thing as the cost of performing service, when it is to be used for determining the revenue of the company.

The months vary very greatly, one from the other. The month of October, on most railroads in the West, is a month of very heavy business, by reason of the difference in the method of taking record of the tonnage, part of it being taken from billing, and part from the date of receipt, there would be a very great opportunity for tonnage to be omitted that was actually carried in that month. Or, on the other hand, there might be a great deal of tonnage included in the figures which would not move at all on the rails of the company during that month. Therefore, the great uncertainty as to the accuracy of the tonnage would make the first grave doubt as to the accuracy of the method for computing the cost.

Q. Would the incorrectness that would result from that method of ascertaining the relative proportion of freight carried on local and through trains be cured by the fact that the omissions and the

inclusions to which you refer would occur from month to month and would be about the same in each month. Or, in other
4325 words, would the difficulties you speak of be covered by an equality of "lap-overs" from month to month in the freight omitted, or that might be omitted in the Auditor's revenue accounts?

A. It would not, in my opinion. I do not believe that any one month should be taken or could be taken as a basis upon which to determine an accurate computation. Any month might be a high one or it might be a low one; and if it should happen to be correct in any given case it would be so purely by accident and not by reason of the inherent accuracy of the theory. No short period of a day, a week, or a month, would be safe. They would all give opportunity for variations sufficient to destroy the value of the method as a means of determining the separation of cost.

Q. What effect, if any, would any change in the character of the tonnage have upon the correctness of that method of ascertaining the total tonnage.

A. By "Character of tonnage" do you mean the character of the freight?

Q. I mean the character of the business, and the character of the freight, and all the characteristics that enter into and form an element in determining whether the method of keeping accounts by the auditor would give a correct result.

A. A variation in the character of the business handled
4326 that is, business of kinds that had different origins or destinations during that time—for instance, if during the month that was used as the basis of these computations there should be any material change in the class of business handled, there might be a very material opportunity for a variation in the time at which those tons would be recorded and they might be omitted in that month, or other tonnage might be included. It would have a bearing on that same opportunity for inaccuracy.

Q. What effect would congestion during the period that is covered by this investigation, and during the month or a congestion which was at its height during the month that is selected as a representative month, and in which the relative tonnage is sought to be determined in the manner I have described, have?

A. If congestion existed in the State of Arkansas during the month that was used in this theory, undoubtedly the same congestion existed in States outside of Arkansas, on lines connecting with the lines that are being considered here. That would mean in any such period of congestion the business would all move more slowly than at a time when business was being handled in a normal way. That would mean that business would be delayed outside of the State and inside of the State, and the margin for such inaccuracies would be greater. There would be a greater spread between
4327 the tonnage actually moved in that month and the tonnage that was recorded by the method described.

Q. Would such a condition have a tendency to change the proportions of tonnage carried by the two classes of trains mentioned, that is, the local and the through trains?

A. Yes, sir, it would for this reason among others: that in a time of congestion, when a railroad is hard pressed to move its business and keep its terminals clear, it would use to the fullest possible extent the capacity of the engines on its local trains, and the proportion of long haul, or interstate business, handled on its local trains would increase during such a time. And the local trains being ordinarily such light trains, the addition of comparatively few cars to their make-up would materially alter the percentage of giving tonnage that was carried in those trains.

Q. What do you think of the practicability of apportioning the expense of interstate and intrastate traffic by separating and ascertaining the cost of operation of through and local trains, as the state has done in "Exhibit K"?

A. I have given the matter of finding an accurate method of dividing that cost considerable thought, and have heretofore expressed myself as being of the opinion that there was not any practicable way of determining it by any mathematical calcula-
4328 tions, or any exact method; and I am now of the same opinion.

I do not think the State has yet solved the problem. I think the plan outlined in Exhibit K is not a practicable one.

Q. In introducing this scheme of division the State assumes that it has presented a method which is not based upon theory, but upon actual conditions; and they advance it here as an apportionment based on actual facts.

Judge HILL: I do not think that is a correct statement of the State. We object to the form of the question.

Col. MOORE: Q. (Continued.) In that view, what is your opinion of its merits as presenting a division based either actually or approximately on facts.

A. As I read the State's Exhibit K, the basis used is one that is not based upon facts, but to a very large extent upon assumptions of facts which in my opinion have no proper basis in fact.

My idea of the office of an accountant is that he should record accurately things that occur, and not undertake to formulate theories to prove one thing or another. It would be quite possible, by not very serious modifications of this particular theory, to make a very wide variation in the results that would be obtained from it.

4329 Q. Will you take Exhibit K and go over it in detail, and give your views as to the various divisions and the bases used by the State's accountants in making their divisions.

A. Item one on Exhibit K refers to maintenance of way and structures expenses, and states:

"The proportion of these expenses applicable to the freight business, as shown by the statements in this case submitted by the Company, has been divided between local and through train service on the basis of the total engine and car miles of each class, during the month of October, 1907, that month being considered representative of the business for the six months ended December 31, 1907."

Now, in the western country, so far as my knowledge and exper-

ience goes, the month of October is not an average month, but is always a month of heavy business. The month of October 1907, in particular, was an exceedingly heavy month—in fact I think business in the entire West was heavier in that month than in any previous month in the history of Western railroading; and heavier then than in any succeeding month.

Therefore, in the absence of actual local knowledge, I would not consider that month representative of actual business for six months from an actual railroad standpoint.

The exhibit then continues as follows:

"In arriving at the number of engine and car miles we have added fifty per cent to the engine mileage of local trains for station switching, and have assumed that each engine mile is equivalent to two and one half car miles."

4330 I question the feasibility of determining whether the addition of fifty percent to the engine mileage of local trains is an accurate addition. No operating man that I know of could determine with accuracy whether that addition is correct or incorrect. It may be right or it may be wrong—I don't know.

Q. Is not switching an indeterminable quantity that is continually varying?

A. Yes, sir, switching on local trains does vary very much from day to day, and week to week, and month to month, and in fact it varies with every trip; and it varies on various portions of the track.

A local train as a part of its day's work may be engaged almost exclusively in peddling out less than carload freight; or, on the other hand, it may have very little of that to do and may be engaged in doing the local switching. Or, it may be engaged in it in varying quantity.

Q. Proceed with your statement Mr. Ward.

A. Then the assumption that "each engine mile is equivalent to two and a half car miles," is made. That is an assumption for which I can see no proper basis. I do not quite understand how that factor of two and onehalf has been reached.

In my opinion the effect of a locomotive passing over the track is very much more than two and a half times the effect of a car

4331 passing over it. The effect cannot be measured by the number of wheels on the locomotive as compared with the number of wheels on the car. The blows which the road bed received from the improper balancing of the reciprocating parts of a locomotive might run two hundred, three hundred, or even five hundred percent as great as those of a car or a train of cars.

In fact, in my own personal experience, I have known of a strip of track to be enormously injured by a trip over it of one engine. It was run pretty fast, though not necessarily exceeding the speed allowed. But if an engine is run fast over a piece of track, immediately following a heavy rain, which has made the track soft, it might do damage which will require thousands of dollars of expense to repair. While that same engine could be run over that same piece of track on a dry day and cause very little damage, scarcely ap-

preciable; so that the two and a half times is entirely insufficient, in my opinion.

Going along further in the exhibit, under the head of "Maintenance of Equipment" the exhibit says:

"The expenses under this head are divided between yard, and local and through road locomotives, on the basis of the locomotive mileage of each class during the month of October, 1907.

We have added fifty percent to the mileage made by yard locomotives to provide for possible extra maintenance due to yard service."

4332 This is another assumption. I don't know where they have found a basis for adding fifty percent. That may be too much or too little. The mileage of yard locomotives is not kept accurately. It is the custom of most roads to credit the yard locomotives with mileage, but, as a matter of fact, the basis of hours worked would be more accurate.

It is the custom on most roads, I believe, to assume that the yard engines make six miles an hour; but those mileage figures when applied to yard locomotives are estimates only and are made only for the purpose of comparison, to determine the comparative cost of maintenance, and to ascertain whether the engine is performing service enough to justify "shopping."

They are not necessarily accurate and should not be used, in my opinion, in connection with the determination of anything so important as the rates, which should be charged for carrying freight.

Continuing with this exhibit it says:

"We have added fifty per cent to the mileage of road locomotives in local service, to provide for the possible extra switching mileage; and again have added fifty percent to the switching mileage of the local train engines, thus ascertained, to provide for the possible extra maintenance due to switching service; (making seventy five percent added to the local engine mileage)."

In the first place, to provide for possible extra switching mileage they add fifty percent; and to that is added another fifty
4333 percent on account of possible extra maintenance due to switching.

In my opinion, it is no more feasible to separate the cost of handling local and through business than for a general storekeeper to determine the cost of selling one article as compared to another. Those are assumptions for which I can find in my experience no basis in fact. I could not determine accurately whether those things are right or whether they are not, and I do not believe any accountant can do so.

Continuing further on with the exhibit, it says,

"The division between yard, and local and through road locomotives on this basis is as follows:

| | |
|---|---|
| Amount charged to yard locomotive mileage | 130,150 |
| Fifty percent added for extra repairs | 65,075 |
| Local locomotive mileage | 70,583 |
| Total mileage | 195/225 |

Percentage 37.64.

To that local locomotive mileage there is added 75% for extra mileage and repairs..... 52,937
Making a total of 123,520 miles, or 23.81 percent.
Through locomotive mileage..... 199,981
Or 38.55 percent.

The total expense under this head amounts to $183,673.40. The amount chargeable to yard locomotives on this basis is 37.64 percent, or $69,135.80. The amount chargeable to local service is 23.81 percent, or $43,733.35, and the amount chargeable to through service is 38.55 per cent. or $70,807.25.

The expense of maintenance of yard locomotives is divided between local and through service on the basis of the number of cars of each class of service handled by yard engines during the month of October 1907."

And then follows a statement of the number of cars handled and the percentage of each.

Now, if I understand this correctly, it means that the ex-
4334 pense of maintaining yard locomotives is divided on the basis of an account of all cars passing throgh the yards where yard engines are employed.

It is customarily the case, in counting cars handled through yards, that they are counted coming in and going out, that is, two counts for each car. If they counted each car passing through a yard twice, they give the local cars no more credit for the services of the yard engine than they do a car passing right through the yard on the through trains. Therefore, the proportion chargeable under this method to the through service would be very much greater than is actually the case.

The opinion of myself, or any other operating official, as to the excess cost of handling state over interstate business is on the basis of actual freight and not on the basis of the number of cars passing through the yards.

I might illustrate that position of mine by pointing to the fact that in practically—in fact I might say in all railroad terminal yards, a very large percentage of the cars on through trains pass through without any handling. The train runs in on to a yard track, and if there is a change in the tonnage by reason of a difference in grade or a difference in motive power on the next divi-
sion, a few cars will be taken off or a few cars put on that
4335 train. Or, there may be a few cars taken off that train, which are destined to that particular station, or to stations on the next local run. But the great majority of cars are not handled in those terminal yards.

On the other hand cars that run in local trains are all handled; they all have to be placed in their trains by the yard engine; and after they reach their destination or the distant terminal they are again handled and placed at industries, or on a house track, or in train yards, to go out on through trains going beyond.

So that a method which would count the cars handled in local trains and in through trains on the same basis would be very in-

accurate in determining the proper proportion of cost of maintaining yard locomotives to apply to one service as against the other.

Q. If you do not desire to say anything more about locomotives, the next item there is "Freight Cars" which you will find immediately following that sub-division.

A. This item (*b*, I think he calls it) freight cars, is as follows:

"The total amount of expense for maintenance of freight cars is $477,895.64. This amount is apportioned to Arkansas by the Railway Company on a car mileage basis. In dividing this expense between local and through service, however, we have taken into consideration the element of repairs due to the stopping and starting of trains at way stations, and repairs due to extra terminal handling of cars in local service.

4336 Mr. A. M. Wellington, in his work on "Railway Location" (page 203) says, that the stopping and starting at way stations is the cause of approximately 21.5 per cent of the repair expenses of freight cars; and that the terminal handling is the cause of approximately 13.5 per cent of the repair expenses.

Taking these elements into consideration, the maintenance expenses may be divided as follows:"

And then follows a table using the percentages given by Mr. Wellington.

I have looked at Mr. Wellington's work and I find that it was written some thirty years ago. I do not know what investigations Mr. Wellington pursued which led him to reach the conclusions shown in his table; but I do know that railroad practice since his book was written and his table published, has entirely changed; and in my opinion his figures can not be verified by any test in modern practice, because the repairs due to terminal handling are very much greater at the present day than 13.5 per cent.

As to the stopping and starting at way stations, I do not know, but I think that percentage is probably too low also.

However, I feel quite sure that 13.5 per cent for terminal handling is not enough.

There is one feature alone which has changed conditions very much, particularly in terminal handling, and that is the use of the automatic couplers. In the days before air brakes and automatic couplers were used, switchmen and brakemen had to go be-

4337 tween the cars to couple them together by the use of a link and pin, and much greater care had to be exercised to avoid personal injury than is the case now, when the cars are coupled by impact and no one has to go between them.

Cars are very much heavier now than they used to be, and the impact is greater and the damage caused is greater by coupling them at a given speed. While it is true that cars have been built more strongly in an endeavor to meet these new conditions, the fact is that the damage done to cars in switching at terminals is very much greater than it was several years ago, and, in my opinion, very much greater than the figure given by Mr. Wellington.

According to his figures there is a total of thirty five per cent of the repairs on freight cars due to starting and stopping and terminal

handling, and sixty five per cent due to other causes. I do not believe any definite determination has ever been reached as to what those proportions are, but as giving some little light on the subject, the Burlington officials, six or eight months ago, were all here in Chicago to look into the question of the high cost of repairs on freight cars, and the cause of the heavy damages which we found occurred. We had some forty or fifty of our yard masters here in Chicago. It was the opinion of that body that the damage done to cars was somewhere near seventy five per cent in the terminal yards.

4338 At that time we entered upon a campaign to reduce that trouble by modernizing some of the locomotives in the yards, and cautioning all those who were handling cars to handle them more carefully.

The principal items that go to make up the cost of repairs to freight cars are the repairs to the draft rigging, the couplers, and the sills—the sills perhaps more than anything else. Damage to the car sills occurs to a very great extent in the yards in the switching of the cars.

Turning again to exhibit K, it states:

"Assuming that each local train makes a stop say each five miles; and each through train a stop, say each twenty miles; the local service should be charged with four times as much as the through service in proportion to car miles for the expenses due to stopping and starting. Assuming also that each car in local service received two terminal handlings (including handling at local stations) to each terminal handling of a car in through service, the local service should be charged with two times as much as the through service, in proportion to car mileage, for the expenses due to terminal handling."

And then follows a table illustrating that idea.

I assume that these average distances as stated are approximately correct. But that does not constitute a proper measure of the expense of handling local as against through service, because the through train in starting and stopping simply takes the siding, and after it has met the train, which has the right of the road, it then proceeds; or, in many cases its stop is only for the purpose of taking coal and water and it does not have to stop even while the man

4339 turns the switch. On the other hand the local train goes into the siding and after it is there it has its work to do by taking out the cars or placing in cars at the various industries or on the house track at that station; and it must pick up other cars and place them in the train. To an extent that constitutes, for all practical purposes, a terminal handling for all of the cars in that train at practically every station along the line of its run. So the multiple of four to one for the through service, on account of the assumed difference of five miles and twenty miles would not be correct. It would be more nearly eight times although I don't know that eight is accurate. However, it is more nearly eight times than it is four.

For that reason the local, in my opinion, under this theory is not

charged with nearly as large a proportion of the car repair expenses as it should be.

I do not know that I want to make any comment on the item of "Supervision, etc."

Q. Mr. Ward, right in that connection, in the same paragraph you have just read is a statement to this effect:

"Assuming that each car in local service received two terminal handlings (including handling at local stations) to each terminal handling of a car in through service, the local service should be charged with two times as much as the through service, in proportion to car mileage, for the expenses due to terminal handling."

Is there anything about that point upon which you wish to comment?

4340 A. Apparently the accountants who worked this plan up counted this handling at local stations as a service of the same character as the terminal handling, and this multiple of two times for one is wrong. I think I covered that in a general way in my statement in regard to the stopping and starting each five miles instead of each twenty miles. They all come under the same class. The whole method, it seems to me, fails to take into account that feature that the handling of the cars in the local service is very much greater than in the through trains.

Q. What is the next item you wish to take up?

A. Under the head of "Transportation expenses" is an item Yard and terminal expenses." The exhibit stated:

"These expenses are divided between local and through business on the basis of the number of cars handled at terminals as explained under the head of maintenance of yard locomotives."

The same inaccuracy in regard to the division applied to yard locomotives as between local and through trains would apply here.

Q. "Fuel and Locomotive Expenses" I think is the next item: what have you to say about that?

A. The exhibit says:

"According to a test made on St. Louis Southwestern Railway during October, 1908, the local engines consumed 3.5 percent more fuel per engine mile than the through engines. Assuming that the same conditions would prevail on The St. Louis, Iron Mountain & Southern Railway during October, 1907, the fuel and the miscellaneous locomotive expenses would be divided between local and through service on the following basis:"

4341 And then follows a table carrying out that idea.

It seems to me that the distribution of the cost of fuel and locomotive expenses on the basis of a test made on another railway in another year, would hardly be fair considering the importance of the conclusions to be reached and the results of such conclusions.

As I believe I stated when I testified in this case before, engines of local trains are almost always smaller than those on through trains; and are loaded to a smaller percentage of their capacity than are the larger engines on the through trains. Therefore, if in this test 3.5 per cent more fuel per engine mile was used on those small engines, lightly loaded, than on the heavy engines, heavily loaded,

the cost per ton per mile for the fuel expense must necessarily be very much greater for the tons handled on those local trains than for the tons handled on the through trains. So the conclusions reached in the exhibit would be very far from being correct.

The difference of 3.5 per cent that is shown on the exhibit is undoubtedly due to the fact that those engines on the local trains do so much more starting and stopping, and do so much more switching in transit, that their mileage is counted, as I read this exhibit, as straight mileage, and no allowance is made in that particular case for station switching or anything else but straight mileage; so the basis is very wide of the actual facts and of the correct ones.

4342 Q. The next item is "Other Train Expenses": what have you to say about that? That includes casualties, and things of that sort.

A. The exhibit says, under the heading of "Other train expenses": "These expenses are such as are incident to, or generally caused by, the operation of trains, and are not included in the preceding classifications. They are divided between local and through service in proportion to the train miles of each class of service, during the month of October, 1907."

If the item of "Casualties" "Personal Injuries occurring on trains" is included there (and I believe it is) the train mile basis would not be fair because of the greater risk that employees on local trains are subjected to than are those on through trains. The employees on the through trains ride directly over the road, and the chances of injury to them are pretty slight. On the other hand, the employees on the local trains are not only engaged in switching at the stations, cutting cars out of and setting them into trains, but they handle such a large amount of package freight, loading and unloading it, and the opportunities for personal injuries, more or less service, are very, very much greater than in the case of the through trains.

That is one item that occurs to me as upsetting the train

4343 mile basis for dividing that particular expense.

Q. What is the next item?

A. The next item is "Loss and Damage—freight."

The same difficulty would apply there, because of the much greater opportunity for loss from pilferage and improper handling and damage to the packages handled in local trains, because the cars are opened at every station and the freight is knocked down and handled; and if the train crews are careless before the train gets to the next station in many cases the freight falls down and is damaged.

That is the reason why, perhaps, this method would not be fair at all. But inasmuch as an attempt has been made, apparently, to divide this on the basis of actual claims paid, that item may not be so very important. I think perhaps the State's accountant has been nearer right in that than in any other item I have seen.

Q. Mr. Ward——

A. Pardon me, but I wanted to speak about the general situation as it is reached up to this point. (It seems to be the case that up

to this point in this exhibit the endeavor of the State's accountants has been to determine what is a proper method of distributing train and car costs between local and through trains. And when they have done that, according to the method adopted, they undertook by taking into account the tonnage of state freight handled on
4344 local and through trains respectively, to ascertain the ton mile cost of handling such freight; and have assumed that the cost of handling a ton mile of state freight on a local and on a through train is the same as that of handling a ton mile of interstate freight on the same train.

This assumption, in my opinion, is an erroneous one. It fails to recognize the fact, which I endeavored to point out in my previous testimony in this case, that the terminal handling of short haul intrastate fright is much more expensive per ton mile than of long haul interstate freight. Many more car miles are required to handle a given number of intrastate, short haul ton miles, than the same number of interstate, long haul ton miles. A much larger amount of property and facilities is required to handle such a quantity of intrastate, short haul, ton miles, than of interstate, long haul, ton miles.

By this I mean that the station facilities at the local stations through any state, so far as my observations go, are when measured by the ton miles, used to a very much greater extent than is the case with other business passing those stations, or even originating at or destined to those stations.

In order to make myself clear on this point, I might explain that a ton of freight of a given kind received at a country station, will not cost any more to unload from a car and deliver to a con-
4345 signee, if it has originated in the State, than if it has originated in another State.

But when the cost of handling that ton of freight is divided by the ton miles applicable to it, it makes a much heavier charge per ton to the short haul, intrastate ton, than to the long haul interstate ton.

Q. Mr. Ward can you give an instance that will illustrate the idea you mean to convey there?

A. I might illustrate it by saying that I suppose the people of Arkansas, as in other States, buy a good deal of merchandise from mail order houses like Sears, Roebuck & Co. and Montgomery Ward of Chicago; let us imagine, if you like, the purchase by a man in a country station twenty five miles South of Little Rock; say he buys a ton of merchandise of Sears, Roebuck & Co. and it is carried down to his station and is delivered to him from the same car and at the same time as is a ton of the same kind of freight which he needed in a hurry and purchased in Little Rock. The station expense at the delivering station, in each case, is exactly the same; each operation is precisely the same as the other. But when you measure it by the ton miles, you have twenty five miles to apply to that ton which came from Little Rock, and approximately six hundred miles on the ton that came from Chicago; so there is perhaps twenty four times

more chargeable to the state ton than to the interstate ton, in
4346 that station expense.

Continuing in that statement of the matters that were overlooked in this assumption of the Sate's accountants, I would like to say that the various allowances made by the State's accountants, as shown in detail in exhibit K—such for instance as extra mileage for engines on local trains on account of station switching; extra and excess cost of repairs to yard engines; extra cost of repairing cars running in local trains; extra wear and tear on road-bed and structures through operation of local trains, etc., are to a large extent made necessary by the handling of this short haul intrastate business.

In fact, the assumptions made by the State's accountants omit some of the most essential factors, which in my opinion, go to make up the large difference between the cost of handling the two classes of business.

Further, if any attempt were made to accurately assign a division of operating cost as between state and interstate business, the accounting expenses by reason of the employment of additional men to record the facts would still further accentuate the already excessive cost of handling state over interstate business.

Q. What effect has the long and the short haul—what difference exists between state and interstate freight, on the cost of handling those two classes?

4347 A. I think that effect is illustrated by the example I gave you of that ton of freight from Chicago as compared with one from Little Rock, going to the station twenty five miles South of Little Rock. The interstate long haul ton has so many more miles to divide into that expense that the expense per ton per mile is very much less.

In the case in point my recollection is that the average haul per ton of state business in Arkansas is seventy miles, and of the interstate per ton two hundred and twenty four miles. Both of those are the number of miles in the State of Arkansas, as I understand it. Whereas, as a matter of fact, the interstate and intrastate freight must move a very considerably greater number of miles than two hundred and twenty four. So that proportion of three to one does not actually hold good as applied to the whole situation.

Q. Does the addition of fifty per cent to the car miles of local trains for switching at stations, as made under the head of "Maintenance of Way and Structures" provide for the actual expense of state over interstate business, grow out of the fact that the larger part of the switching is chargeable to state freight?

A. It does not. It seems to undertake to determine the cost of handling cars in local trains as against the cost of handling cars in through trains, but does not touch at all the cost of handling
4348 freight in those trains, as between state and interstate.

Q. Would that allowance as made there as between the two classes of trains, cover the extra cost of handling the state freight over the interstate?

A. No, sir, in my opinion it would come very far from doing it.

Q. There is a similar allowance made under the head of "Maintenance of Locomotives." They have added fifty per cent to the mileage of yard locomotives to provide for possible extra maintenance due to yard service; and fifty per cent to the mileage of road engines used in local service, to provide for switching in local service. The same is true of that, I suppose, is it, Mr. Ward?

A. Yes, sir.

Q. Allowance is made for starting and stopping and terminal handling: Is there an added element of extra cost on state over interstate freight that is not provided for in that allowance between local and through trains?

A. It seems to me that one great difficulty about the State's plan is that an attempt has been made to determine the cost of handling a local train as against a through train. In determining that, and in trying to determine it, a great many assumptions have been made which I cannot accept as being correct. But, after that is done, there still remains a number of very important factors which
4349 are not taken into account at all.

If the State's method of determining the cost of the local as against the through train worked out right, there still remains to be determined the question of how much more it costs to handle the state or short haul freight in that train than the interstate or long haul freight in that train. In fact, there is practically another question.

Q. I believe, if I remember aright, you testified when you were on the stand formerly in this case, that in your opinion it costs five times as much to transport state freight as interstate freight.

A. I expressed that as my opinion as applied to this case.

Q. Are there any facts developed in this Exhibit K (and the other exhibits filed in connection with it for the purpose of developing the theory upon which the State is seeking to divide these expenses) which would change or affect your views in that regard, Mr. Ward?

A. I have given the subject a good deal of thought from time to *item*, because it has come up not only in this case but in other States, in which I have been interested as a railroad man; and the more I think about it the more I am inclined to think that estimate is low and not high, as to the excess cost of state over interstate.

The conditions, as they seem to me, point to the fact that
4350 I have state it in quite low terms, and not at all too high.

I certainly have not modified my opinion as to its being as much as that.

Q. Mr. Ludlam, who is one of the State's accountants, and whose firm prepared these exhibits you have been discussing, testified that the extra expense as developed by the method of division adopted by the State was eighty seven per cent: how do you account for the difference between the eighty seven per cent developed by the State under its method, and the views expressed by you, and to which your attention was called a moment ago, that it costs five times as much?

A. It is due in part to the erroneous assumptions that have been

made here, in undertaking to divide the cost of local train service or through train service; and in part to the omission of those other elements to which I have referred.

My opinion is, as it was before, that this is not a matter which can be determined by any proper system of accounting. It is one very difficult of solution, and the closest approach to an accurate result in the matter can be secured, in my opinion, by getting the views of operating officials who are in contact with this kind of work every day of their lives, and who are watching it, and who have had every opportunity to see under what conditions the
4351 various classes of traffic are handled.

Q. I want now to call your attention to Exhibit M filed by the State, which contains their scheme for dividing the expense of transporting State and interstate passengers.

You will observe that the State has adopted a different method of making that division, and seems to divide it between the different classes of cars, without regard to trains.

They state in the opening paragraph of the exhibit:

"As nearly all passenger trains on the St. Louis, Iron Mountain & Southern Railway do a local business, we have not considered it necessary to make any division of expenses as between local and through service. Our statement of operating expenses covers the six months ended December 31, 1907, and the division of expenses is between coach and Pullman service, interstate, intrastate, mail and express business. In general, the expenses are divided on a car mile bases, the mileage used being that of October, 197."

They state as a reason for that, that the state and interstate passengers are carried on different kinds of trains. The same is true of state and interstate freight, as between local and through trains.

I would like to know what you think of the consistency of making a division of expenses of freight traffic, as they did, on the basis of the relative expense of the local and through trains; and of abandoning that method when it comes to dividing between
4352 state and interstate passenger business, and adopting the method outlined in what I have read you from their exhibit.

A. The change in the method does not seem to be consistent, inasmuch as there is approximately the same relation between the local passenger train and the through passenger train, as there is between the local freight train and the through freight train.

The local passenger train is used for doing the short haul business and, as I believe I stated in my former testimony in this case, there is a lot of expense attached to the handling of local passenger service which cannot be measured on a car mile basis. The local passenger train has to have in service for a given number of train miles a very much larger number of passenger cars, as those local trains runs practically in daylight only, and are tied up at night.

On the other hand, the through trains run day and night and make two or three times as much mileage daily, throughout the year, as do the cars in the local service.

So I think the objection to this method of determining the cost of handling the state passenger traffic is about as I have stated it

just now, due to the fact that they have overlooked that element of the short haul and long haul feature in the carriage of these passengers, and in the use of a greater amount of equipment;
4353 also the necessity for a greater use of the station facilities in the State for the state passenger train in the case of the through passenger.

Q. Take up the first division in that exhibit, "Maintenance of Way and Structures": You have already expressed your views as to the feasibility of dividing that expense as they have attempted to do, and have given your reasons therefor. I suppose that will apply here, but I want to call your attention to the manner in which they have divided it between coach, Pullman, mail and express service, on a car mile basis.

It is a conceded fact, I think, that as a rule Pullman cars are not hauled on local trains; also that the larger part of the state passengers travel on local trains and of the interstate passengers on through trains.

A. That is probably the case.

Q. The point I want to call your attention to is, is it proper to put those cars on an equality for the purpose of determining the relative cost of the different classes of passengers hauled in those cars, when some of them are not used, and if any at all but in the slightest degree, on one class of trains.

A. You are speaking of maintenance of way and structures?

Q. Yes, I am speaking of the expense for the maintenance of way and structures, which of course is affected to some ex-
4354 tent by the passage of these cars over the road, and the purpose of this is to divide that expense between the occupants of the cars.

A. If I understand this correctly, a car in a passenger train, no matter what its class, is counted as running a mile on equal terms with every other car.

Q. That is correct.

A. That seems to me to be wrong, because the cars differ very much in their weight, in their length, in their value, and in the amount of attention they need in order to keep them fit for the business in which they are engaged; and I do not see how it is possible to divide the expense of handling the state or the interstate passenger by any accounting method; and certainly not by this one which classes all cars as the same. They are very different units.

Q. Under the general heading of "Maintenance of Equipment" the first sub-division is "Locomotives": if you will read that exhibit you will see the manner in which the division has been made thereon, and I would like to know how that impresses you.

A. As I read that it means that the locomotive expense is divided into the total number of cars that the locomotive handled, counting each Pullman, coach, mail and express car as the same kind
4355 of a thing, while it is not the same but is entirely different; they are entirely different units.

Q. By this method they are divided on a car mile basis, are they not?

A. Yes, sir. For instance, a Pullman car is very much heavier

than an express car, and to haul it the engine has to work much harder and it is required to burn very much more coal.

If there was a way of dividing it between cars, they certainly should not be divided equally between the different kinds of cars, but more consideration would have to be given to the difference in weight and also the difference in length. A long car hauls very much harder than a short car—that is, of a given weight.

Q. The next item is "Passenger train cars"; you will find on the exhibit a short statement of the method of division. That is divided between coach, mail and express service.

A. That seems to be open to the same objection. It assumes, I think, that each car mile of the three classes named is of equal character to the others; whereas that is not the case.

The coach miles, for instance, as applied to a passenger train car expense would be very much more expensive than a mail or express car, being of an entirely different character and having to be maintained up to an entirely different standard.

4356 Q. Does not maintenance of passenger cars also involve repairs rendered necessary by injury from starting and stopping?

A. Yes, sir.

Q. What effect would that have as between the cars hauled on the local and the through trains respectively?

A. Such effect as starting and stopping has, and it is considerable—would be very much more in the case of the local than in the case of the through trains, because the local trains stop much more frequently than do the through trains. The through trains run perhaps forty or fifty miles before making a stop, while the local trains stop at every station, which are perhaps not more than five or six miles apart.

Q. If that is true the local trains on which the local passengers principally travel should be charged much more than the passengers on the through trains.

A. Yes, sir.

Q. Look down there on that exhibit at "Traffic Expenses": you will see that those expenses are divided between intrastate, interstate, mail and express business on a gross earnings basis:

The last two items in the tabulated statement of earnings and percentages based on earnings, you will find 11.63 percent of

4357 that class of expense charged to mail and 7.70 percent to express, making in all 19.33 percent of the traffic expense charged to mail and express:

Is there any service rendered by the agencies that incur that expense, in working up business for mail and express, to which you could charge that?

A. Nothing appreciable.

Q. What do you think of that basis of division?

A. It puts in a proportion of expense—well, I am not sure yet that I understand that.

Q. Read that carefully, Mr. Ward.

A. (After reading.) I see it now. It divides that 19.33 percent of that total expense——

Q. It charges 19.33 percent of the total traffic expenses to mail and express.

A. That is wrong, because there is no appreciable expense in connection with the solicitation of mail and express business.

Q. The next heading is "Transportation Expenses". Under that general heading is the sub-heading "Station Expenses": examine that, Mr. Ward, and give us your views in regard to the basis adopted there for dividing those expenses.

A. The exhibit states as follows:

"Station expenses divided between intrastate and interstate business on the basis of the number of passengers of each class
4358 handled, after making an allowance of about ten cents per day for the handling of mails at certain stations; and assuming that each intrastate passenger makes use of two terminals, and each interstate passenger makes use of one terminal, as follows:"

Q. Under their method they have charged intrastate with $52,377; and interstate with $4,678. That, apparently, is 91.8 percent of station expenses chargeable to intrastate business.

—. I don't know whether that would be accurate or not.

And I do not quite understand this allowance of "about ten cents per day for the handling of mails."

Q. It is a small matter, but the point to which I wish to call your attention is that they have not made any exclusion of trans-state passengers; they have made no provision for that.

A. Those trans-state passengers of course do not use the station facilities at all.

Q. To diverge just for a moment, for the purpose of illustrating the matter, would not the same principle exactly apply to trans-state freight?

A. Yes, sir.

Q. Of course this cannot be far wrong, but I want to test it as to the correctness of the basis upon which it is predicated, and for that reason I am calling your attention to small matters like this.

A. It omits consideration of that fact, there is no question
4359 of that.

Q. The next item under that heading is "Yard and Train Expenses", which you see they have divided between coach, Pullman, mail, and express service, on a car mile basis; charging the coaches and each of them with a percent that is set out in the table there.

Mr. Ward, the following items are included in that account, which covers yard and train expenses:

| | |
|---|---|
| For yard and train service the total expense is | $549,069.76 |
| Of that, yard service is | 15,124.00 |
| Train and engine men | 182,772.00 |
| Fuel and other supplies | 135,712.00 |
| Care of passenger cars | 50,600.00 |
| Engine house expense | 46,499.00 |
| Clearing wrecks | 17,879.00 |
| Injuries to person | 56,128.00 |
| Damage to stock and property | 39,624.00 |
| Miscellaneous | 5,088.00 |

You will observe that the same expense is charged to passengers on all these classes of cars, on local and through trains, state and interstate; and it includes the wages of crews and engine men, fuel and supplies, and the care of passenger cars; and divides that between local and through, state and interstate, and these classes of cars to which your attention has been called.

4360 Q. What are your views about that.

A. It is open to the same objection that applies to the other items in passenger classification.

In particular, for instance, injuries to persons, is an item which probably could have been accurately divided, but an attempt to divide it on a car mileage basis, including all kinds of cars, is manifestly wrong. And because, as I have stated before, the cars in local service are subjected to a different kind of treatment in service than are the cars of through trains.

The inclusion of those items of yard service, wages of train and engine men, fuel and other supplies, on a car mileage basis, is wrong. It is unfair, and charges too much to the through service, and not enough to the local service, and to the local trains on which are carried the state passengers.

Q. The care of passenger cars includes, I suppose, the cleaning of them, and things of that kind?

A. Yes, sir. I think I called attention to the fact in my former testimony if not today, that those cars in local service require a great deal more attention in the way of cleaning than do the cars in through service, because they are cleaned and attended to at the terminal each day; and in addition to that the coach requires a great deal more attention than does a mail, baggage or express car.

4361 They are entirely different units, and to count any of these things on a car mileage basis is wrong. It is comparing unlike things and classifying them all on the same basis.

Q. The next item is "Loss and Damage—baggage": that expense is divided between intrastate and interstate business in proportion to the gross earnings of each:

In view of the different characteristics of the service incident to baggage on local and through trains, would you consider that a fair division?

A. I should consider that was an item that could be definitely located by an accountant, and that he would not have to divide it on the basis of any percentage, if he sought to secure an accurate division.

4362 Cross-examination of Mr. FRANK WARD.

By Judge HILL:

Q. Mr. Ward, one of the questions asked you yesterday (Page 607) was:

"It is assumed that the state presented this division of expenses upon actual conditions and they advance this scheme as an apportionment based on actual facts:"

You have gone through the exhibits and I ask you if you do

not recognize the fact that they have attempted—whether successfully or not I am not now discussing—to use actual facts where they could, and then use what they considered the nearest factor where they could not get actual facts. I am not asking you whether they have successfully done that or not, but merely the effort that has been made there?

A. As nearly as I can tell by looking at the exhibits alone, and without seeing the testimony of those who put them in, it seems to me they have attempted to reach actual facts by methods with which I cannot agree.

4363 Q. I understand that. I am not asking you about your agreement but I ask you if it is not a fact that the exhibits show that they are using the factor which they evidently considered reached more nearly the facts themselves.

Take Maintenance of Way, no one claims you can get the actual facts on that, but what factor would most nearly approach the actual facts: is not that the case?

A. As I say, I think they have tried to do that, so far as I can tell by the exhibit, without the explanation that undoubtedly went with the exhibit when it was presented, which would undoubtedly make that clear.

Q. I will read the explanation made by Mr. Wharton at page 506. He said:

"From the reading of the testimony in the Missouri case and my understanding of the purport of that testimony it appeared all the time that the difference- in cost of state and interstate business were mainly differences in cost of local and through trains. The witnesses all seemed to testify that way and we determined that if it was possible we would work up statements showing the cost of local and through business and after getting that cost we would ascertain in the best manner possible the cost of state and interstate business carried in the two classes of service; in that way getting away from any question of theory, but getting down to an application of the facts and of the testimony given in that case, and subsequently given in this case."

Does not that bear out the suggestion made, whether they have been successful or not I am not now discussing; but that was the effort, to reach the nearest common factor where the actual facts were not known?

A. I think they have tried to do that.

Q. It is not a matter of actual facts because we all recognize that you cannot get the actual facts on some of these matters;

4364 but to get the factor that will most nearly approximate the actual facts: is not that the case.

A. I think that is what they have tried to do.

Q. I am not discussing with you now the scheme but I will discuss that with you later, whether they have done so successfully or not.

A. Yes, sir.

Q. Taking up the first item of Maintenance of Way, Mr. Wharton said, at page 517:

"Personally I think the expense should be divided on a gross ton mile basis which includes the weight of equipment and the weight of the product hauled, but this is the best information we had at hand to make a division." (Meaning the car mile.)

"Q. You think if you had the information the other way you would get a little closer to the facts, is that it?

A. I believe so.

Q. This is the best method that would most nearly represent the actual facts that were available.

A. Yes, sir."

I will ask you what you think of using the car mile as a factor to determine the cost of maintenance of way as between local and through trains, where there was no data by which they could get the gross ton mile?

A. You refer now to maintenance of way expense?

Q. Yes.

A. I do not agree that it can be reached by either method.

4365 One of the main difficulties about dividing maintenance of way and structures expense on either a ton mile or a car mile basis is the fact that a very considerable part of the cost of maintenance of way and structures is not caused by the movement of the traffic over the road but by the elements and I consider that either method would be very unsatisfactory and likely to be very far from the actual facts.

And besides that, the effort in this case is to determine the cost of handling freight in the local train as against the cost of handling freight in the through train; and that is a question almost of another nature than the determination of the cost of handling state versus interstate traffic.

So the elements of difference are so great and so numerous that I would not consider either method as approaching accuracy in the solution of the problem.

Q. Do you think the fact that a large part of the expenses of maintenance of way are caused by weather conditions and natural decay, should affect the use of a factor, when the factor represents the use to which that property is put?

A. Well, the objection to using a factor of that kind is the fact that in this particular case, for instance, we have got to take another question into consideration; and that is the uses to which the property is put, other than the handling of freight.

4366 For instance, there is passenger use and it opens up an entirely new question as to how much of certain parts of the maintenance is properly chargeable to passenger service.

You take the fences and the necessity for keeping the track up to a condition which will give the maximum comfort to the passengers, aside altogether from the question of safety, which would be the only question involved in the handling of freight trains.

I believe there is another question involved, that would throw doubt upon the use of the car mile basis in maintenance of way, either local and through or state and interstate.

Q. What is that?

A. That is the question whether maintenance of way and structures expense should not be divided in the same way as either general or unlocated expenses.

Q. Is it not a sound proposition of accounting that you use the factor that would most nearly represent the use of the property?

A. If the same factor must be used, I should say, yes.

Q. How much of the maintenance of way expense do you ascribe to weather conditions and how much to traffic?

A. I have not made up my mind definitely as to what proportion should be attributed to weather conditions. Railroad men differ a good deal on that subject. I have seen opinions to the effect that 90% of it was due to deterioration on account of the elements, and others down as low as 75%, or even less.

4367 My personal opinion is toward the lower figure.

Q. Is not this a sound proposition: he was asked along the same lines you have just been asked—was it not a fact that a large part of that was due to weather and natural conditions, and then was asked would that affect the basis: and he said it would not—is the substance of his testimony. And then occurs this, as a reason why they should use the factor:

"Because the primary object is to keep the tracks and roadway in condition for the operation of trains. We have to keep up the tracks and roadway for the trains to run over, and naturally whether the expense is caused by the train itself or is necessary so the trains may run over the tracks, it seems to me it would naturally follow the use made of the track."

Isn't that sound?

A. I think it is sound with the exception that it seems to make the assumption that the whole use of the track is for the purpose of running freight trains.

Q. I do not so understand it. He is speaking generally now, Mr. Ward.

Then when he comes to a subdivision he does make that use of it as between different classes of freight trains.

A. If I understand what you read of his testimony before, he was arguing in favor of the use of the gross ton mile?

Q. That was on freight trains. But I am speaking from the detail to the general proposition.

Is not this a sound general proposition:

"The freight and passenger trains that you have to keep up the tracks and roadway for the trains to run over, and naturally whether the expense is caused by the train itself or is necessary so the trains may run over the tracks, it seems to me it

4368 would naturally follow the use made of the track," would be a proper factor?

Is not that true?

A. I think that is true, assuming all the time that it must be divided into the business that moves over the track. I do not feel sure that is right. I do not really feel positive that it is not, but

I do not feel sure it is right. I think there is room for a great deal of argument for dividing that expense the same as general expenses.

Q. I understand that and I think a great many witnesses on this side and also on the opposite side of the case have taken that view.

But as I understand you, speaking generally, this is a sound proposition?

A. Yes, sir, with those assumptions I have mentioned.

Q. Coming to the division between freight and passenger, what do you think of the train mile as a proper factor to determine that?

A. I don't think that is proper. It would depend a good deal on the purpose for which we are undertaking to make the division. It may be for the purpose of simply making a comparison of a superintendent's performance of work on his own division, from month to month or year to year. On the other hand, it might be on a matter as important as the making of rates for freight and passenger. And if for the latter, a great deal more care would be needed to be exercised in order to make a fair division.

4369 Q. The latter is the object to which this litigation reaches, of course, to ascertaining whether the intrastate rates are compensatory. With that object in view and approaching the problem in this first step, maintenance of way, is it proper to divide that on the basis of train mile, as representing the use of the way?

A. My opinion is that it is not.

Of course, my opinion differs so materially from those of the accountants for the state in this respect, that I do not think the use of any of these factors, or any method that has been proposed heretofore, can really satisfactorily solve the problem. I wish it could, but I do not see that it can.

Q. Taking this as a basis I want to ask if I correctly understand your position:

"Maintenance of way and structures: This account includes all repairs due to maintenance of way and track, bridges, trestles, fences, culverts, etc., also material and supplies used in repairing same and supervision. This expense is practically all localized and is charged to the state in which the expense is incurred. The total charge to maintenance of way and structures is divided between freight and passengers upon the basis of the number of train miles in each class of service."

What do you think of that method of division?

A. That, as I understand it, is a method of division prescribed by the Interstate Commerce Commission. Speaking as an operating man I would hesitate very much to accept that as a basis upon which to determine the question we have under discussion now—that is, the cost of handling state versus interstate business.

4370 I think it omits a good many items that should be considered in trying to solve that particular problem. I do not think that division had in mind any such proposition as that we are discussing now.

Q. If that is used as a basis here to start a division of expenses, you consider it unsound?

A. Yes, sir.

Q. Mr. Ward, I notice all through your testimony you object to using the statistics compiled on the October movement: and as I understand your testimony, it was for two reasons, primarily because you could not take any one month as representative of the business; and, secondly, because you thought October was probably a heavier movement than the other months: is that correct?

A. Yes, sir.

Q. You are not familiar with the actual conditions of affairs in Arkansas, I believe you testified in your previous testimony?

A. That is true.

Q. I want to call your attention to the way those figures were put into this case:

Mr. Kimbell, the Assistant General Auditor of the Cotton Belt, with whom you are acquainted, I presume, testified as follows: (Page 80 Vol. 1).

"Q. Mr. Kimbell, did the operating officers of the St. Louis Southwestern Railway Company make a test at any time after this litigation was instituted, for the purpose of ascertaining the relative cost of conducting state and interstate transportation? If so, I wish you would state what was done in that respect?

4371 A. A test of that kind was made under my direction.

Q. What period did it cover.

A. The month of October, 1908. The temporary injunction was granted in St. Paul on September 3rd, and the month of October was selected for the purpose of this test, on account of it being the first full month following the injunction. October is rather a heavy month, but for a test of this kind, in my judgment, it fairly represents the general conditions".

And then Mr. Moore asked him this question:

"Q. Would it represent, fairly, a year's business?

A. I should say. It would represent relatively, the difference between the two classes of traffic."

He was asked further about that by the state's counsel, as follows:

"Q. Do you think that one month would fairly represent the business of your line for a year?

A. I think for the purpose of a test of that kind, determining the relative difference between the two classes of freight, that one month is perhaps as good as another.

Q. Why did you select October?

A. As explained, it was the first full month after Judge Vandevanter granted the injunction. He granted it in September, September 3rd; we wanted to make this test as soon as possible, so we selected the first full month.

Q. In your judgment, a test of this kind, made for the month of October, would fairly represent the operations for a year, or for a series of years.

A. I should say so."

Q. I also want to call your attention to the testimony of Mr. Doddridge, who has been the General Manager of both of these roads. (Page 43 Vol. 2).

Mr. Doddridge was asked this question:

4372 "Q. Do you think the test of one month's operation would be fairly representative of the entire year?

A. I think in this case that it would be representative as to the relative proportions of the different kinds of business, for the reason that the month of October, 1908, was one of the heaviest months of the year, and considerably above the average twelve months, probably.

The main purpose in making this test was to determine the average relation that one class of business bore to the other, and if the business of the road was lighter in a subsequent month, the chances would be more than likely in favor that the relative proportions would remain pretty near the same."

In view of this testimony, Mr. Ward, would not you feel like accepting that month as a fair basis, on the testimony of the Assistant General Auditor of one of the roads, and by a gentleman who had been general manager of both the roads.

Mr. MOORE: You should be further informed, Mr. Ward, in regard to the test that counsel calls your attention to:

It was made upon actual ascertainment from the actual movement of the freight carried on each class of train; and was not ascertained upon the relative amount of each class of tonnage in local trains only as in the Iron Mountain case.

A. In the case of the Cotton Belt, I do not know just what the test was and I cannot answer without that information, as to whether it would be likely to be a fair method. But, no matter what it was, in my opinion, it is a thing that cannot be measured out by figures and facts, even though you put men on the trains to watch every movement.

As to Mr. Doddridge's testimony, the only thing I can

4373 say about that is that I totally disagree with him.

Q. How about Mr. Kimbell, do you disagree with him?

A. In the first place, I do not know what his test was—yes, I do disagree with him because it cannot be done that way.

I might answer further that in a case not conducted under my charge but of which I have heard, Mr. Gray, the Comptroller of the Northern Pacific Railway, I think some three or four years ago, thought he would make a test and see if he could reach a basis.

He put auditors to ride trains on one of his divisions, and they watched the movement of every piece of freight of all kinds, and undertook by all the means that they could find to make a separation.

They were dissatisfied with the results, because they were not sure of its accuracy.

My recollection of the case is, that as nearly as they could figure it out the cost was eight to thirteen times as much for state as for interstate business. That was in Minnesota.

Mr. Gray wrote me two or three weeks ago, in reply to an inquiry I made to him about it, that thinking the matter over since that time they had reached the conclusion that the proportions would be very different and that the state would cost more than as

indicated at that time. The net result was that they could
4374 not tell accurately from the test what the cost was.

In other words, the test did not agree with their opinion?

A. No, sir. They tried to find a way, in the hope of being able to submit something to the state—as this case was coming up—that would be satisfactory. But they were not satisfied that the facts could be ascertained by those methods.

But, so far as the facts showed, they showed the cost of from eight to thirteen times more for state than for interstate business.

Q. It disagreed with their opinion?

A. Yes, sir. And as I understood Mr. Doddridge's testimony I disagree with him entirely.

Q. Mr. Kimbell's was the same test. It was made by Mr. Kimbell, but I believe the testimony shows it was made at the instance of Mr. Doddridge.

What I have read to you has been relating to the same test.

A. So far as I understand it, I cannot agree with them.

Q. The statistics on the Iron Mountain Railway were put in by the Iron Mountain, but I do not believe they had been analyzed as between local and through, as they were on the Cotton Belt:

The State's accountants have analyzed them substantially as was done with the Cotton Belt statistics.

4375 Mr. MOORE: The statistics contained in Exhibit 26 in this case, to which counsel refers, which gives the total amount of state and interstate tonnage taken in the Auditor's accounts from the waybills, was prepared at the request of the state's counsel in a conference held in the Judge's Chambers during the progress of this case.

I state this in order that there may be no misunderstanding as to how that came into the record.

Judge HILL: I did not so understand that. I remember it was given to us as the result of such a conference, but I understood it had already been prepared by the railroads and certainly the state's counsel did not ask for it to be introduced. Isn't that correct, Mr. Johnson?

Mr. MOORE: Some of the data was prepared, but that data was prepared as the result of a conference in Judge Trieber's chambers.

Mr. JOHNSON: In the Missouri Case such a statement as that was called for by the railroads and it was our understanding that it would be required in the Arkansas Case: and we worked it up for that purpose.

In Judge Trieber's chamber, at a conference between yourself and Colonel Moore, when Mr. Wharton was present, Mr. Wharton asked for three months of these figures and we told him we had prepared them for one month for his convenience and did not feel we should be called upon to prepare them for three months. Judge
4376 Trieber then said we should not be required to prepare those figures.

Mr. Wharton finally agreed that the figures for one month would answer the purpose.

For our own purpose, in presenting this case, we would have no

use for that exhibit. We believed that rather than check over the state exhibit it would be better for us to work that up ourselves, because it took us a considerable time to check their statement in the Missouri Case.

Judge HILL: You did prepare these and had them prepared before Mr. Wharton ever requested them, did you not?

Mr. JOHNSON: That is right.

Judge HILL: And you introduced them yourself, and not at our request?

Mr. JOHNSON: Only to this extent: that it was the statement compiled for this case and if we had not introduced it we felt you would call for it, just as was done in the Cotton Belt Case.

Judge HILL: But we did not call for them?

Mr. JOHNSON: It was not necessary, because we had filed it. And in the meantime we had turned over a copy to the state expert.

Judge HILL:

Q. Mr. Ward, irrespective of the history of the matter, that one month's business has been introduced by the railroad and it
4377 has been analyzed by the state accountants. I have read you the testimony of the witness on behalf of the railroad, as to another statement representing the one month's business and as I understand from your testimony, you disagree with these gentlemen that that would be fairly representative of a year or a series of years?

A. Yes, sir, I do.

Q. I believe you stated, probably more than once in your testimony yesterday, that after you determined the cost of the local and through freight trains, and after you determined the proportion of freight upon each of those trains, the problem of working out the expense between state and interstate still remains to be solved?

A. Yes, sir.

Q. That is your position about that, is it?

A. Yes, sir.

Q. I want to read you from the testimony of Mr. Doddridge—you know Mr. Doddridge, don't you?

A. I have just met him. I cannot say I know him.

Q. I will state for your information that Mr. Doddridge has been General Manager of both Iron Mountain and the Cotton Belt Railroads?

A. I know in a general way what his experience has been.

Q. At page 57 of the record in this case, the following occurs:

"Q. Your analysis of the different classes of freight, interstate and intrastate, is based on your experience and knowledge of the operation of the different kinds of trains, local and through,
4378 and the proportion of intrastate traffic carried on each isn't it?

A. Well, the local train is simply one of the incidents of the extra cost. It is not the whole reason. It is one of the circumstances and conditions of the handling of the short-haul business of the railroads.

Q. I think I have allowed for that in this question, if you will consider it more fully.

Previous question is here read.

A. Yes, sir.

Q. So we will understand terms correctly, Mr. Doddridge, in talking to each other, I will ask you if there is any such thing as an intrastate train; that is, an intrastate train which carries exclusively intrastate traffic?

A. There is no such train that I have ever heard of.

Q. There may be an intrastate train, but for the purpose of our inquiry it carries interstate traffic, and has to be considered relatively as to the traffic that is upon it.

A. It carries all kinds of business.

Q. That is true also of all trains, isn't it?

A. Yes, sir.

Q. Intrastate or interstate or transstate?

A. Yes, sir.

Q. It is a question of the proportion upon each?

A. It is a question of proportion upon each."

Q. Now, in further explanation of that view he says—or, rather, this testimony was read to him from the Missouri Case: I wish to read this statement made in answer to a question:

"So far as the particular freight is concerned, carried on those particular trains, there would be no greater cost in transportation for interstate freight than state freight, except the terminal charge.

4379 In order to ascertain the results correctly, you would have to take into consideration the amount of state freight that is carried upon that train, as applied to the total state freight carried on the other train.

In other words, what I mean to say is, we have to take into consideration all the trains and find out what relation the state freight bears to the whole."

Then this question was asked him:

"That is a correct analysis, isn't it?

A. Yes, sir, I think so."

Do you agree with this statement of Mr. Doddridge?

A. I don't believe I draw the same inferences from Mr. Doddridge's statements that you seem to.

If I understand you correctly, your idea is that Mr. Doddridge's statement was that with the exception of the terminal charge the cost of handling state business on those trains is the same as the cost of handling the interstate business?

Q. Yes, that is my understanding.

A. I would not draw that inference from what you have read.

Q. In other places he does state it, frequently, that that is his view.

A. That is not my view.

Q. That is what I was wanting to ask you, if that is your view.

A. No, sir, it is not.

Q. You knew Mr. I. G. Rawn in his lifetime, I presume, did you not?

4380 A. Yes, sir.

Q. He testified in this case heretofore the same day you did. I want to read you from his testimony at page 368:

"Q. What relation is there, if any, between local and through traffic, and state and interstate traffic? I will be glad if you will explain what, in your experience, you have found to be, if any, the relation that exists between the two classes of freight traffic?

A. For the purpose of determining the cost of operation of transportation, the question of state and interstate traffic is not the method of consideration. The method is that of through and local business."

Do you agree to that?

A. I do not because Mr. Rawn has not completed the statement, I think.

His answer omits a good many things which would be necessary to complete the answer, as I would make it; and, therefore, I do not agree with him. It is only a partial statement.

Q. Mr. Rawn further stated (page 383) going a little bit away from the proposition he is here discussing:

He was asked how he would divide the expenses between the local train and through train and he answered:

"One of perhaps the most accurate methods of determining the division of costs, if that is proper, is the ton miles. That is one of the very large elements and methods of determining the cost of the through freight and the local freight; on the question of maintenance and many other things that would otherwise not be determinable.

Q. What besides maintenance?

A. Maintenance of equipment and maintenance of way."

Do you agree with Mr. Rawn's views on that subject?

4381 A. No, sir.

Q. Mr. Rawn further stated (Page 366):

"I do not consider that there is any material increase in cost in maintenance of cars in local freight business and through freight business."

What do you think of that proposition?

A. I think it is very far from being correct.

Q. Then he takes up the question of locomotives. He says there is a difference on locomotives. But it was on cars I was calling your attention to.

You disagree with that?

A. Yes, sir.

Q. You were questioned yesterday considerably about various allowances that were made in the exhibits by the state, of 50% for extra switching and counting an engine 2½ times a car, and various other allowances, which you discussed in detail. I gathered from your answers with regard to that, that you were assuming that the accountants had arbitrarily assumed these figures.

I want to call your attention to the fact that the evidence here

shows that the accountant who prepared the exhibits had no first hand knowledge of these matters but informed himself and put those various allowances in on the basis of the best information he had. Those allowances have subsequently been sustained by the testimony of various witnesses.

Is not that a matter of fact in each particular case, to be ascertained by actual conditions?

4382 A. I do not believe that the facts can be ascertained by any known measure. Nobody can tell whether it is 50% or 40% or 60% addition. It is a varying quantity. It differs every day that the trains make a trip.

In particular reference to the question of the wear and tear on the track by a locomotive, that may differ so widely that one could hardly express it in figures.

The conditions are such that I do not believe anybody is competent to lay down a definite figure that could be safely used as an average.

Q. I understand that to be the case. That it is not attempted to be used as a general average, they have used these figures as applicable to these two roads; and then used the best judgment they were able to get as to whether a given percentage was the proper one for those particular roads.

Could not that be ascertained, not with mathematical accuracy but with a fair degree of accuracy, by men thoroughly familiar with these different matters on each particular road.

Colonel MOORE: I want to call attention of the counsel as well as the witness to the fact that there is no witness I recall now, who claimed to have had any experience in railroad operation, who has testified in regard to these matters to which counsel refers, any witness who had any knowledge of the local conditions on those roads.

They were gentlemen connected with railroads commis-
4383 sions in Texas and Oklahoma, who had never been connected with operation on railroads in the state of Arkansas, and knew no more about the local trains there than the present witness, Mr. Ward.

JUDGE HILL: I wish to call attention to testimony given by Mr. Wright, Traveling Auditor on the Iron Mountain Road.

Mr. MOORE: Wright was not a practical operating man, but simply traveled over the road as Auditor and *and* testified from his casual observations from traveling over the road.

Mr. HILL:

Q. The question is, are not these matters which are local in their nature, to be worked out according to the best judgment of the parties familiar with local conditions?

A. I do not believe those matters are local in their nature. I think they are of general application and I have had a great many years of railroad experience and covered a great deal of the country and have observed how these things are done; and they are practically

the same all over the country. My opinion is that these items cannot be accurately measured.

Q. While we are upon one of those matters which was an assumption, I will call your attention to this question of the fuel.

It seems there were no statistics in existence for the last half of 1907 on the Iron Mountain Road by which the fuel could be ascertained. In the test on the Cotton Belt, for October 1908, the
4384 actual figures were worked up. That matter was presented to Mr. Doddridge (Page 106):

"Q. Fuel, I presume, is another one of the chief items as you worked that up in the Cotton Belt case. Would the actual figures be worked up on fuel cost between local and through trains on the Cotton Belt, apply generally on the Iron Mountain?

A. I presume that those propositions would be applicable in a general sense to the Iron Mountain, or it ought to be.

On page 107 he says:

"In a general way the test on the Cotton Belt ought to reflect the general average conditions."

Then this was asked him:

"Q. That is all I am after. The detail may be different. You have taken that test on the Cotton Belt as a representative one and I want to know whether the proportions would be representative on the Iron Mountain?

He said:

"Yes, I used that largely as a basis for my calculation."

In view of that testimony from the gentleman who had been the General Manager of both those roads and worked that up and used those figures as representative in his various tests, would not you say it was right to accept those proportions as fairly indicating the general conditions?

A. Yes, I think so, in this sense.

If a locomotive handling a local train on the Cotton Belt Road consumes 3.5% more fuel per engine mile than the locomotive handling a through train, and Mr. Doddridge, who knew the conditions in both places, thought that would be a fair proposition on the Iron Mountain, I should say it would be. But I would not
4385 draw from that the inference that 3.5% greater fuel consumption should be applied to the ton mile. That would be an entirely different proposition and I do not understand from what you have read that Mr. Doddridge drew that inference. It was simply the percentage of fuel used per ton mile on local trains.

Q. Yesterday, as I understand you, in discussing the passenger proposition you criticised the state's accountants for not following the division of local and through on the passenger side of the question:

Do you know how many local or through passenger trains there are in Arkansas?

A. I do not, no, sir.

Q. Have you any judgment as to the usual proportion of local and through passenger trains on a well managed railroad?

A. That would differ altogether with local business conditions and would differ very widely on any well managed railroad.

Q. That would be purely a local question?

A. Yes, sir. The only assumption I made on that was, there were local and there were through trains.

Q. I believe the principal objection you had to this division was on the ground that the through trains would carry Pullman and the local trains would not?

A. I do not believe I expressed it that way.

The cars of all classes, mail, baggage, and express, coaches
4386 and Pullman, were all classed as the same kind of cars, so far as the use of these figures was concerned. And I objected to that method of classification. There is a great difference between them.

Q. In what would that great difference consist, Mr. Ward?

A. One difference is in the different weight of the car.

Another difference is in the length. Length makes a great difference, with similar weight. The long car is more destructive to the road than a short one of similar weight.

Another difference is the attention that is required to maintain and repair cars of different kinds. Mail, baggage and express cars are very much cheaper in maintenance of operation than are the coaches.

In addition to that, the coaches that are in the local service, stopping at every station, are more expensive in maintenance than are the coaches in through trains, which run through and are cleaned and attended to only at the end of long trips, instead of each day at the end of short trips.

Q. I believe the matter I had in mind was more in the question than in your answer. At page 632 Mr. Moore says:

"It is a conceded fact, I think, that as a rule Pullman cars are not hauled on local trains; also that the larger part of the state passengers travel on local trains and of the interstate passengers on through trains."

You answered: "That is probably the case."

4387 I don't know where Mr. Moore got his concessions on those points.

Col. MOORE: It is a matter of common knowledge.

I think that could not be controverted.

Mr. HILL:

Q. You think that is a correct statement, do you?

A. Yes, sir, I do.

Q. I wish to call your attention to an exhibit filed in this case by Mr. McPherson: you know Mr. McPherson, I presume?

A. I do.

Q. He was called upon to designate which of the passenger trains were local and which were through, and filed an exhibit, No. 46, showing the same.

That exhibit shows there are eight through trains and forty-eight

local trains in Arkansas—that is, during the period under consideration.

With that view, as to the difference in the traffic, only eight through trains and 48 local trains, would you say the expense should be worked up between the local and the through?

A. I don't quite understand what is meant by saying there are eight through and 48 local trains. He does not give the relative train mileage of the through and the local trains?

Q. Yes, that is given.

A. Is it in that proportion—six to one?

Q. I don't know. That would take quite a good deal of
4388 calculation, in order to determine.

If you look at this exhibit perhaps you can get it. He designates the through trains and gives their run and the number of stops.

A. (After examining exhibit.) I do not think you could tell it by that. He does not show whether they are "daily" or "daily except Sundays."

Q. These are all daily.

A. They run on Sundays as well?

Q. That is my information. Here he analyzes that and gives the stops of each one of the trains. And then he gives the run of each local train and the stops and the number of stops.

The previous question is here read to the witness as follows:

He was called upon to designate which of the passenger trains were local and through and filed Exhibit No. 46, showing the same. That exhibit shows there are eight through trains and 48 local trains in Arkansas, that is, during the period under consideration. With that view, as to the difference in the traffic, only eight through trains and forty-eight local trains, would you say the expense should be worked up between the local and the through?

A. I think so, if we are going to attempt to determine the relative cost of handling state versus interstate passengers.

4389 Q. Why?

A. Simply because if you ignore the difference in conditions, you will reach an erroneous conclusion and make the assumption that the cost is the same on one as on the other.

Q. Don't you think in view of this situation, the cost would be substantially the same on one as on the other?

A. No, sir, I do not.

Q. Wherein would be the difference?

A. Those forty-eight trains which undoubtedly handle the bulk of the state business would undoubtedly be more expensive in their operation; and the handling of the passengers on them would cost more than in the case of the passengers handled on those through trains.

Q. Don't you think from this exhibit here that the bulk of the interstate passengers would also be handled on the local trains?

A. That might be so. But it would not alter the fact that the

bulk of the state passengers were handled on those local trains; and those eight through trains undoubtedly handle a lot of people.

Of course, this is a question which really can be answered much more intelligently by a local man; and I would be a little afraid to be too positive in that opinion, as to the details of that, because of my lack of knowledge of local conditions.

Q. Let me give you another explanation of this: one of
4390 these eight through trains is a fast mail, that sometimes carries one sleeper and never carries a day car. I am not certain whether it carried a sleeper at the period under consideration. Mr. Johnson might tell you.

Mr. JOHNSON: It did.

Mr. HILL:

Q. It carried one sleeper?

Mr. JOHNSON: Yes.

Mr. HILL:

Q. In further consideration of the fact I will state I calculated from a time card the number of sleepers carried on the local trains. My time card was of a little later date than the period under consideration and may not be exactly accurate, but it is substantially so. I think thirteen of the local trains carried sleepers.

In view of these facts, would you say there should be a distinction made between the local and through passengers?

A. Oh, yes, certainly, for this purpose.

Q. You do not think these facts would modify your views?

A. No, sir.

Q. With the exception of one sleeper on those eight through trains, there were only seven through trains as against 48 local trains, and 13 of those 48 local trains carried sleepers?

A. In the comparison of trains you have so far ignored the question of mileage. No doubt those two trains are measured
4391 across the state; the mileage in which case is greater in each case than the mileage of the forty-eight local trains.

Q. No, some of the forty-eight local trains have the same mileage as the eight through trains.

Mr. MOORE: Give me the number or the date of the time card you referred to, please.

Judge HILL: I had a current one and it may not be accurate, as I have already said. But I do not suppose it is absolutely inaccurate. I wish to get a time card of the period under consideration. However, I think this one is nearly accurate.

Q. Mr. Ward, of these through trains, six of them (including that mail train which carried very few passengers) ran the length of the state, 305 miles; two of them made 184 miles each; and of the local trains, two af them made only the length of the state, 305 miles; six of them made 202 miles——

Mr. MOORE: Is that mileage of the through trains in the state of Arkansas or the total mileage of the through trains?

Judge HILL: In the state, I would assume, from Mr. McPherson's statistics.

Mr. MOORE: That is what I understand to be the case.

Judge HILL: I assume it would be true of the locals, just what is in the state.

Mr. MOORE: Most all of the locals are within the limit of the state.

Judge HILL: I just called attention to the fact that two
4392 of the locals ran the entire length of the state, just like two of the through trains. And six of them ran 202 miles. (Which I presume is the Memphis train.)

In view of these mileage facts, Mr. Ward, would you say there is any necessity of working up the cost between the local and through?

A. I do, if we are going to determine the cost of handling the state versus the interstate passengers.

Q. Would not these figures show you very plainly that the bulk of all the passengers in the state, both state and interstate, are carried on these local trains?

A. I would not say. That could be ascertained by an examination of the records.

Q. That would be the natural inference to draw from the facts I have just put before you, wouldn't it?

A. I do not think it would be safe to draw that conclusion, no, sir. Many of the local trains are very, very light and carry very few passengers. While most of the through trains are very heavy and carry a great many passengers.

Q. I will call your attention to the further fact that two of these trains go to Memphis?

A. They simply cross the river to get out of the state.

Q. That makes them interstate in this calculation?

A. Those handled west of the river would be state.

Q. The same thing would be true of the through trains?

A. Except that the through train does not do stopping
4393 to drop off passengers that the local trains do.

Q. Generally speaking, how often do the through trains stop?

A. Thirty to sixty miles, generally; and local trains stop at every station.

With regard to passenger business, I have watched with a great deal of interest the movement of passengers, in an endeavor to determine how our trains should be carded and the times and places where they should run.

My observation is that a very large percentage of all the passengers who travel, travel from their own town to the next station that is bigger than the one they live in.

The probabilities are that in the case of the local trains the passengers travel from a short distance and go from their own town to the next market town or county seat. That is the way the passenger business of the country travels, as a rule. I have examined the

records of hundreds of stations, to ascertain what the habits of the people are in traveling.

Q. I believe from your testimony I would infer that you do not believe in the car mile as a basis to determine the cost of maintaining equipment, either freight or passenger?

A. Not for this purpose, no, sir.

Q. Why is not that a good factor to determine the relative cost?

A. Well, it bears upon the purpose of the inquiry.

Q. You understand the purpose of the inquiry here is to
4394 find out whether those rates are compensatory.

A. I understand that. But I mean if a railroad wants to know what it costs to maintain its cars, it is a proper thing to keep a record of the miles they make, and determine how much it costs per mile per annum; or per car per annum. But if we are undertaking to determine what it costs per mile to repair a car with reference to the business that is carried in that car, then I do not think the car mile is a fair basis.

As I stated, yesterday, the car mile in local business, which is the car mile used to a greater extent than any other in the handling of state business, is a much more costly car mile than is the car mile used in the through business. The car is handled, so much more, and under conditions which are much more destructive to the car.

Q. Using the car mile as a measure of maintenance of equipment for the purposes of this suit, what do you say of it?

A. I think it is wrong. I think the state's accountants have recognized that by undertaking to add certain constructive miles to these miles in local service, in order to attempt to reach a theoretical car mile, because the actual car mile was not fair and reasonable.

Q. Suppose you want to use the car mile to get at the expense between states, with a view of seeing whether the rates are compensatory, and divide your business between states. What
4395 then would you say as to its being a proper factor?

A. We would still be in the difficulty that the car handling the state business is a less efficient agent, that is, it moves less ton miles than does——

Q. I do not think I made my question clear, Mr. Ward.

Suppose cars are used in two or three states—and of course they would be used in both kinds of traffic in those several states?

A. As between state and interstate business?

Q. No, not as between state and interstate, but as between two states. Suppose you had a road that ran in two states and your cost of equipment was divided between those two states on the basis of the car mile, what would you say as to that—or say six or seven states. No matter how many states your system runs into. How many states does the Burlington System run into?

A. I think it is twelve.

Q. If you had a rate case in one of those twelve states would you divide your cost of equipment between that 12th state and the other eleven states on the basis of the car mile?

A. I don't think I would.

If I were undertaking to determine what it costs me to do busi-

ness in that state I would have to make a careful local examination of what the conditions were; and if they justified apportioning more than a pro rata proportion of the expense to that state, I would so apportion it.

4396 Q. That would be comparing the condition in that state with the condition in the other eleven states?

A. Yes, sir.

Q. It might be that to one state that would be unfair, that is, too little, and very much too much for another state.

A. It might be.

Q. Owing to the conditions of the business?

A. Yes, sir.

Q. Your attention was called yesterday to a trans-state proposition on the station handling, and I believe I called your attention when you were on the stand heretofore to the fact that in Arkansas there is a great deal of the interstate traffic that has two or three handlings in the state, like cotton and grain and lumber, and various other large commodities, whose movement constitutes some of the largest percentages of these roads.

In view of that fact, it would not do to say that generally speaking the interstate business had one terminal and the state business had two terminals and the trans-state business no terminal in the state, would it?

A. I think generally speaking, it would be safe. I think I called attention to the fact that when I was on the stand before, in that particular case, that all states probably have some special condition attached to them: Minnesota has its iron ore and grain,

4397 which is interstate business; and North Dakota has its wheat, and Arkansas seems to have its cotton.

Q. And lumber?

A. Yes, lumber. I had those general conditions in mind and I tried to make allowance for the general conditions of that kind which must apply in all states. But that does not alter the substance of my view.

Q. Of course, the extent of this movement having three terminals in the state would be a matter that would modify the proposition as to how largely they would alter the general run of such things.

A. They ought to be taken into account.

Q. I omitted to ask you about one matter.

You testified yesterday that you did not think the mail and express should bear any part of the traffic expense: I want to call your attention to the fact that that item was questioned as being a proper item against intrastate traffic at all, that no part of these outside agencies and industrial agencies, etc., should be charged to intrastate traffic.

Quite a number of witnesses (I cannot recall them all) have testified that it was proper on the theory that these agencies build up the country and induce the business in to the country, and that any agency which would tend to build up the country and build up the traffic on the road generally, would indirectly redound to the benefit of the intrastate traffic. I believe that is about the

theory upon which the state is charged with a proportion
4398 of that expense. If that theory is true should not the mail and express also be charged with a proportion of it on the same theory?

A. It seems to me the point is a very small one. I would not personally think very much of the expense should be charged to the intrastate business.

Q. That is the position we took, but this gentleman converted us to the proposition of "laying up treasure in heaven"—or Arkansas—and we felt that on that theory they should be charged with their proper proportion.

A. That is true, in a general way; but I think it is a pretty fine point.

Q. I think so. But if you are going to accept that fine point, you should apply it to mail and express as well as intrastate traffic, don't you think so?

A. Yes, sir, it seems to me so.

Q. You agree with me that it should be cut out entirely or should be spread over all the business?

A. Spread over the business in such proportions as are correct, when ascertained.

Q. We may differ as to what would be the correct proportions, but get some factor that would properly spread it: is that the idea?

A. Yes, sir.

4399 Redirect examination.

By Col. MOORE:

Q. To the extent that that class of expense should be charged to intrastate business, on account of building up the state and thereby increasing the general business of the Company, that view is based upon the proposition that in doing that you do build up and develop the business of the railroad; but as I understand it the mail and express business is worked up by other agencies and the railroad has nothing to do with it except to carry it for other people—the mails for the Government and the express for the express companies. In that view there would be a difference between the ordinary intrastate business and the mail and express in the application of the principle to which Judge Hill called your attention?

A. Yes, sir, there would be a slight difference.

Q. I want to call your attention to the service rendered to cars in through trains, in the handling they get at division terminals, while being transferred from one train or track to the other; and the service rendered to cars in local trains, such as their being switched to industries, etc.: Is there any comparison in the expense of industrial switching for local cars and the switching that is given to cars on through trains at division terminals, for the purpose of transferring them from one track to another?

A. There is a very great difference, of course, in the
4400 handling and in the destructive effect on the car; a car in through service simply being put from one train into an-

other, or having its engine and caboose changed, as comparatively little is done to it and in many cases nothing whatever.

But a car switched in industrial switching has to be handled a number of times, depending upon the conditions. It has to be taken from one train and put on another track and sometimes there are a group of cars going into the same track or territory and, depending upon conditions, they are perhaps rehandled again, to be placed at the proper end of the switch tracks. These run in all directions, and the cars have to be dropped from the head of the train to the rear of it; and there are many movements which go to increase the risk of injury and the cost of maintaining those cars, which do not apply to the cars passing through terminals in through service.

Q. That would result in a very much heavier expense for maintenance growing out of switching to industries for local cars than it would to switching that applies to the through cars, in transferring them from one train to the other, would it not?

A. Yes, sir, and it was that difference I had in mind in making my statement yesterday.

Q. Mr. Ward, your attention was called to Exhibit 46, filed in this case by Mr. McPherson, showing the through and local trains. A reference to that exhibit shows, for the purpose of illustrating the point to which I call your attention, for instance, that
4401 through train number 3 runs 305 miles in Arkansas; in that 305 miles it makes ten stops; it carries 4 Pullmans. According to the assumption made by the State's accountants in their exhibits in this case, of the passengers on those cars seventy-five per cent are interstate passengers and twenty-five per cent are state passengers. That is the condition in regard to that train. The run of that train in addition to the 305 miles in Arkansas is 184 miles in Missouri, making the total run of that train about 500 miles.

Train number 24 is a local train; that also runs 305 miles; in running the 305 miles it makes sixty-eight stops. We will assume it carries one Pullman car ( I don't know whether it does or not). The local or state passengers in that car do not sleep there but go in there to get a more comfortable seat, going from station to station on the run of that car in the state:

I want to call your attention to these conditions and ask you to state, in view of those conditions what your opinion would be as to these matters to which Judge Hill has called your attention?

A. I think it simply calls attention to the necessity in such a matter as we are discussing of taking into account the difference between the local and the through train so as to accurately reach a conclusion as to the cost of state versus interstate business.

4402 Q. That shows also, does it not, that it would indicate that the Pullman on the local train is used for short haul business?

A. Yes, and such reference as I have heretofore made to Pullman cars has been with the idea of considering them not so much as "Pullmans"—as that is only a name—but as sleeping cars; not as

parlor cars, which may be also "Pullmans". I was thinking of sleeping cars.

Q. One of the grounds upon which you predicate your objection to the division of expenses on a car-mile basis, within the state, between these different classes of cars, is the different conditions?

A. You are speaking of passenger service?

Q. Yes. The different conditions which exist in regard to the cars themselves and the difference in the expense of maintaining the different classes of cars.

A. Yes, sir.

Q. In speaking of the division of cost of car equipment between the states, on a system which covers more than one state, you also stated that would not be a desirable way to divide it; but there is one thing to which I wish to call attention:

We will take the case in hand: the Iron Mountain operates in Arkansas, in Missouri and in Oklahoma; there are three states in which it operates; in each one of those states there are through and there are local trains. The probabilities are that the
4403 general conditions which would vary as between the cars used in the state locally, would as between those three states constituting a part of this system, be generally about the same. That is to say, they run local trains in Missouri, and they do in Arkansas, and they do in Oklahoma; and probably the same variations exist in each one of those states. I think that would naturally be the case.

Isn't that difference of condition such as would preclude a division between the different kinds of cars within the state, isn't it decreased very largely when you come to divide the cost on a system running in different states, growing out of the fact that the general conditions, etc., would be about the same in the different states—you have my idea?

A. Yes, I think so. I think I agree with you fully on the proposition.

Judge HILL:

Q. What is the proposition you are agreeing to, Mr. Ward?

A. My understanding is, that on a system of railroad which operates in a number of states, in those states there are varying conditions, such as through trains and local trains; and different costs of handling business on those through and on those local trains; and that in those different states those conditions are relatively about the same. And for a system undertaking to determine the cost of maintaining its equipment (as between the states) it would be fair to make the assumption that as between one state and another the conditions would be about alike. Is that the proposition?

4404 Col. MOORE: That is the proposition I asked you about.

A. That is the way I understand it.

Judge HILL:

Q. Why would that justify it on a car mileage division between states any more than between through and local trains?

A. It would be simply a comparison of one state with another, for the purpose of maintaining the Company's own records. That is the general proposition.

Q. You mean for the purposes of comparison of operation in one state and operation in another state, as to the question of efficiency in the management of the road: isn't that it?

A. Yes, sir, and a little more than that.

For instance, on the Burlington road if we were going to undertake to determine whether it cost more to handle passengers in Iowa than in Nebraska, the conditions as to through trains and local trains, branch line trains and main line trains, would average up one state with the other pretty well; so it might be safe to say it costs no more and no less to handle passengers in Iowa than in Nebraska.

Q. That would depend upon whether the conditions in Iowa and in Nebraska were the same, would it not, Mr. Ward?

A. Yes, sir.

Q. So your whole proposition would resolve itself into the question of whether the conditions in one state fairly represent
4405 conditions in all of the states into which the system runs?

A. Yes, sir, and also upon the idea that as between states in the same general territory those conditions are approximately the same.

Q. Do you know in how many states the Missouri Pacific System runs?

A. I know about where the system runs. I know generally.

Q. It runs through ten, eleven or twelve states.

Isn't that right, Mr. Johnson?

Mr. JOHNSON: It runs in nine states.

Judge HILL:

Q. Wouldn't you say that the conditions in those nine states are similar, so you could use the car mile as a basis to find out the proper expense in any one of those given states?

A. No, sir, not in all. There is a good deal of difference.

Col. MOORE (resuming):

Q. Any division as between states would be diminished when you come to divide between states, on account of that greater similarity in conditions, that you spoke of?

A. Yes, sir, there would be a closer similarity between state and state, probably, than between local and through business in the limits of one state.

4406 CARL R. GRAY, sworn and examined on the part of the complainant, testified as follows:

Direct examination.

By Colonel MOORE:

Q. State your full name, please?

A. Carl R. Gray.

Q. State your place of residence?
A. St. Louis, Missouri.
Q. What is your occupation?
A. Senior Vice-President of the St. Louis & San Francisco Railroad Company.
Q. What are your duties in connection with that? Are you general manager I mean of the Company?
A. I have exclusive jurisdiction over the operations of the railroad and in the absence of the President jurisdiction over
4407 all of the departments.
Q. Will you state when you began railroading and what your experience in that line of work has been?
A. I began railroad service in January, 1883, as telegraph operator and I served in telegraph and station agent's work until March, 1886.
Then I went into the traffic department and was successively clerk and chief clerk in the office of the general western freight agent at Wichita; then I succeeded him in April of 1887, as commercial agent.
Then I was in succession District Freight Agent and Division Freight Agent until October, 1897, when I became Division Superintendent.
I was promoted to superintendent of transportation in October, 1900, General Manager in April, 1904, second Vice-President and General Manager in November, 1904, and second Vice-President from August, 1906; and Senior Vice-President since November, 1909.
All of my service has been with the one railroad company.
Q. What company is that?
A. St. Louis and San Francisco Railroad Company.
Q. Where did you begin your service, Mr. Gray?
A. At Rogers, Arkansas.
Q. During all your service you have been connected with operation in the State of Arkansas, hav ou not?
A. I have been, either directly or indirectly connected with service in the State of Arkansas. Part of my time though, I
4408 have had jurisdiction which did not include the State of Arkansas.
Q. But what I mean is, that your jurisdiction, among others, has included the State of Arkansas?
A. No, sir. For some years I have had no jurisdiction over the State of Arkansas. But I have had jurisdiction over it for ten years.
Q. Mr. Gray, without asking a long question, in the way of explanation I will simply ask you whether you have examined the state's method of dividing the expense of conducting state and interstate traffic or transportation, by ascertaining the tonnage of the local and through trains and then dividing the cost of operation between those two classes of trains, and the method of dividing that between the tons of each class on the ton mile basis?

A. Yes, sir, I have examined these exhibits that have been introduced.

Q. Going back to the beginning of the method adopted which was the relative tonnage of the local and through trains, I will call your attention to the manner in which the tonnage of each class of train has been ascertained by the state's accountants:

They took the month of October, 1907 and by examining the wheel reports and waybills, so far as they could obtain them ascertained the actual movement of freight on local trains in the State of Arkansas during that month.

4409 Now, to ascertain the freight that was handled on through trains they subtracted the tonnage obtained in the manner I have mentioned, on the local trains from the total amount of freight, both state and interstate and of all classes, in the State of Arkansas, as shown by the Auditor's revenue accounts. That ascertainment is shown I believe, on Exhibit "I", if I am not mistaken.

I would like you to state your views as to the correctness of a division of freight hauled, as between local and through trains, ascertained in that manner?

A. I would like to ask if the practice on the Iron Mountain was for the Auditor to take into his accounts his local billing and his interline?

Q. I will state what that was. I intended to state that.

His accounts are made up in this way: System business is taken into account on what is known as "a forwarded basis"; the interline business is divided into three classes, interline forwarded, interline received and interline through or overhead.

A. You have not stated how the interline billing was taken into account.

Q. I will give you then a statement which was furnished to the state's accountants.

A. (After examining exhibit:) I gather from this state-
4410 ment or exhibit, that the local business and interline forwarded is taken into account as of the forwarded date.

That the interline received and the interline through, or where the Iron Mountain is the intermediate carrier, is taken into account as of the date actually reported or finally reported by the receiving agent or carrier.

Predicated upon that I would say that to subtract an absolutely determined amount from one which was not arrived at in any wise by the same manner, is entirely misleading, for the reason that the gross which is represented in the Auditor's net ton miles, includes business that may have been billed for some months before; certainly a very considerable portion of it is billed the month before; and excludes a great deal of business that was actually handled in this month.

That is such a variable quantity, varying as the proportion of the last two may bear to the first two, that in my opinion it is unreliable.

Q. Would the incorrectness that would be developed in the way

you speak of be cured by any equality in the lapovers from month to month, and make it representative in that way?

A. It would not, as applied to any reasonably short period. It might, if applied to a five or ten year period.

Q. I mean for one month, say the month of October?

A. One month as applied to what?

Q. To six months.

A. No, sir.

4411 Q. Have you had any experience on your line of railroad that furnishes you with any information in that respect?

A. At one time in endeavoring to provide statistics of value in determining the relative performance, on the several divisions of the road, we took the ton miles from the Auditor's reports. We found them to be unsatisfactory, for the reasons I have stated; and for the additional reason that the Auditor assumes, naturally, that freight travels through a certain prescribed route.

The operating department may not handle it via that route, for reasons that are good, and sufficient to them; such as interruption of the line or a more economical routing to a certain class of business, or a handling that would conserve time.

Therefore, we were compelled, in order to have reliable statistics, to adopt the method by which we arrive at the net ton miles handled on any division of the road, from the conductor's wheel reports, which represent actual conditions. And we have been satisfied with that.

Q. The tonnage handled on local trains on the Iron Mountain road during the month of October, 1907, in question here, appears to be only 11% of the total tonnage.

In that view about 89% of the tonnage was ascertained in the manner I have indicated from the Auditor's revenue accounts:

What effect would that small proportion of located tonnage, so to speak, have? As between the two classes of trains it
4412 would leave a very large margin for inaccuracy and incorrectness as to the other part of it, would it not?

A. It would add to the possibility and probability of that, in the greater proportion it bears to the amount accurately determined.

Q. What effect would a congestion in the business in the month that is adopted for this division, it being one of a number of months of congestion beginning some time previous, and extending later, with the particular month of October, 1907, in view, as the one in which the congestion reached its highest point and began to recede soon after the end of that month, but was greater during that month than it was during the previous time or later. Perhaps it began receding in the first part of November:

What effect would that have upon the correctness or incorrectness of such a method of dividing the ton miles carried on those two classes of trains?

A. It would have this effect: it would distort those conditions which prevailed under a more normal situation.

To make myself clear, in order to satisfactorily handle local business, the local freight trains running upon something like an estab-

lished daylight schedule, should handle the preponderance of that business.

In time of congestion or stress, that is of necessity lost sight of and under those conditions there can be no doubt that a greater proporton than normal of through business would find its place in the local trains.

4413 Q. Why is that, Mr. Gray?

A. Well, you have a certain given amount of power, and it is human nature, if not good practice, under those circumstances to make it count just so far as you can; and in that case they would load down the local freight trains to the full efficiency of the engine, even in some cases knowing it would be very seriously delayed and the service materially hampered, in an effort to get out from under.

Q. Mr. Gray, you have a copy of Exhibit K there before you: will you take that exhibit and take up the various items in which an effort has been made to segregate costs of operation of local and through trains and state your views as to the feasibility and correctness of the method adopted?

A. Do you want me to take Exhibit K as it comes and criticise each of the propositions contained therein?

Q. I do. State your views with regard to each.

A. Exhibit K seems to me in general a proposition to largely use physical conditions in arriving at this final separation, by first dividing between local and through and then dividing between intrastate and interstate finally.

In the maintenance of way and structures, which is the first subdivision, the engine miles in through and local freight have been determined and 50% has been added to the local engine mileage, for station switching:

4414 I am not satisfied with the 50%, because in my opinion it is not enough to compensate for the extra maintenance which is occasioned by switching.

Q. Is there any way by which anyone can tell what would be the proper amount?

A. I have not any method of arriving at that. I simply say that in my judgment it is not enough.

Q. From all your experience as an operating man you would not be able to state what would be proper?

A. No, sir, I have never felt I could do that.

This assumes further to convert engine miles into car miles, by an arbitrary allowance of 2½ times a car mile as an offset for an engine mile.

Then they have taken all of the freight car and caboose miles, plus 2½ times the engine miles, to arrive at the total of each, local and through.

Then a percentage of each has been taken to divide the maintenance of way expenses as between local and through trains. I believe there is in railroad practice only one more unreliable factor than a car mile, and that is a train mile.

1897

The car mile is so variable a quantity as to be of no service in any comparisons or divisions which I have ever made.

It takes into account no distinction between classes of lading; between weights of lading; between a car where the tare is a large proportion of the load on the rail, and where it is a light proportion. It assumes that the cost is equally proportioned for a car han-
4415 dled five miles as it is for a car handled 300 or 500 miles. The further inclusion of caboose mileage only accentuates this difference.

Above all that, however, is the fact that 2½ times a car mile is not sufficient for a locomotive mile, as it affects maintenance of way expense.

A locomotive, with its shorter wheel base, with its greater axle load, with its connected drivers, with its constantly present problem of counterbalancing, with its constantly changing load on the tank, due to the taking on and using up of coal and water, the known tendency of the engine tank to de-rail, out of proportion to all other carriages, the damage that a locomotive frequently does to the track itself, while on the track and the greater proportion of damage it does if derailed, none of these facts are taken into consideration.

I believe, however, that the greatest difference in the problem here is the fact that so large a proportion of the total maintenance of way expense is not appreciably affected by the volume of business and is a condition by itself.

At least 75 or 80 per cent of the expense of maintenance would be present were the business light or dense; were the preponderance of local and through to reverse themselves.

Q. What do you think of that method of dividing that class of expense?

4416 A. I do not think it is a good method, for the reasons I have stated.

Q. Mr. Gray, I want in that connection to have you state your views as to whether October, or any one month out of six months, say of the last half of 1907— is that month of October in your judgment to be used arbitrarily as representative of the 6 months, with reference to that class of expense?

A. From my knowledge of the conditions on all southwestern railroads in October, 1907, I would say that in my opinion for a comparison of this kind it would have been difficult to have selected a month in which the results would have been more misleading as applied to a longer period, for the reason that the congestion reached its flood during that month, and the conditions which were distorted by reason of the efforts of the operating department to move this unprecedented tonnage would reflect themselves through all of the remaining months, and the proportion of tonnage included which really did not move in that month, and the proportion of tonnage excluded which did move in that month, due to the Auditor's method of keeping his ton miles, would equally distort, and perhaps distort more greatly, all of the other months.

Q. Is there anything further you wish to say now in connection

with that branch of the subject? If not, take up the next, Maintenance of Equipment, which follows after that.

A. In the Maintenance of Equipment, division 2, sub-division A of Exhibit K provides for locomotive repairs.

4417 These are first divided between yard and local and through road locomotives on the basis of locomotive mileage of each class during the month of October, 1907; 50% has been added to yard locomotives to provide for possible extra maintenance due to yard service. 50% to local road locomotives to provide for extra switching service; to which has been added an additional 50% to this 50%, to provide for the possible extra maintenance due to switching service. There is nothing in my experience which justifies either of those assumptions. It is entirely arbitrary. It may be fair, and it may be not enough, and it may be too much.

One of the objections to it, is the fact that the word "mileage" to begin with is an assumption; and 50% added to an assumption does not strengthen it any.

It assumes further to divide the expense of yard locomotives between local and through on the basis of the number of cars of each class.

It is to be assumed that customary practices were followed in arriving at the cars handled at terminals, that is a car in and out counts twice.

Q. That has been adopted; that is the testimony in the case.

A. Yes, sir. The assumption then, that a car in local service requires no more switching than a car in through service, is not sound. It is a very frequent thing in practice for the through train to require one switch. That is, the caboose is taken off and a caboose put on the train. One cut is made to reduce, or one switch is

4418 made to add tonnage, where a reduction or increase in the train load is caused by physical conditions; while, on the contrary, a local train is the one which requires the most switching, and particularly in proportion to the haul.

The local train will in ordinary practice be composed of cars that have been picked up at the local stations, which when it reaches a terminal will go in all the different directions; or at that point are switched together for the through trains.

Another factor which this does not take into account is the fact that the car which passes through that yard, and is never touched individually by an engine, counts just the same in expense as a car which is switched to an industry, where it occasions a switch in some instances even of several miles; it may be handled by itself or handled in conjunction with several others, but it carries in proportion a great many times the expense of a car that would pass through that terminal in a through train.

The difficulty about it also is that it assumes that the cost of switching one car is the same as switching another car. It may be a good theory but my experience does not justify me in the conclusion that it is.

In the case of sub-division "B" "Repairs of freight cars":

This has been primarily apportioned on a car mileage basis

and evidently for the conceded element of additional repairs due to stopping and starting, an arbitrary allowance has
4419 been added.

Q. Pardon me a moment, Mr. Gray, but if you will read the latter part of that paragraph you will find that has been provided for on a basis advanced by Mr. Wellington.

A. I was going to comment on that.

Q. I do not think there has been any arbitrary added on that account: the arbitraries are allowed after that division: I wish to call your attention to that.

A. There is an assumption here of additional cost which is predicated upon Mr. Wellington's book as authority. I do not remember just when Mr. Wellington's book was published: is that in evidence?

Q. The evidence in this case shows it was published in 1877 and then the second edition in 1887. But I suppose it is not very material which year you assume. I think this proposition was contained in his first edition.

A. Whether it was contained in the first or second edition, 1887, precedes by eleven or twelve years, the universal adoption of the automatic couplers; and the adoption of the air-brake.

It precedes by even a longer period than that the introduction of the heavier carriage and heavier engine.

I have never been able to satisfy myself as to the percentage of damage that is done to cars by stopping and starting at stations and in terminals. I am constrained to believe that these figures given by Mr. Wellington are nothing more than a guess, an ex-
4420 pression of his judgment.

If they were predicated upon any test which could have been made prior to 1887, it would be valueless as applied to conditions today.

My own judgment is, that his proportions are reversed. He provides for 35% of the repairs, being due to stopping and starting at stations and handling at terminals. Of that he gives about 3/5 to starting and stopping at way stations and about 2/5 to terminal handling.

In my judgment he has very largely understated the gross percentage due to these two causes, and I think he has reversed the relations.

Q. In other words, you think it would be nearer 70 than 35 per cent?

A. It would be nearer 60 in my judgment than 35, and while I have nothing to substantiate this except observation and judgment and experience, I would say it is nearer 60; and I would place the proportion of damages done in yards and terminals at $\frac{2}{3}$ of that and to stopping and starting at way stations $\frac{1}{3}$.

Q. What is the next sub-division?

A. An assumption has been made here that local trains stop each five miles and through trains each 20 miles.

Q. That is based on the evidence in the case and we accept that so far as that part is concerned.

A. The assumption further is made that each car in local service receives two terminal handlings and that each car in through
4421 service has one handling.

The further objection to this is, that it does not take into consideration the trans-state car which has no terminal handling, distinctly as such.

After first having made an arbitrary deduction of the amounts which have been allowed in this assumption of the expense for starting and stopping and other terminal handling, the balance of this freight car maintenance is divided upon a car mileage basis as between local and through trains:

My criticism of that is, that it has not provided for the additional costs; that the allowances given are misleading and improper as applied to present day practices; and, further, that the assumption that freight car maintenance can be fairly divided into freight car mileage, is not sound, on account of the varying costs, varying sizes and capacities of the different cars; and the further fact that it puts the caboose mile as against the 50 ton car mile; that it puts a refrigerator car against a flat car; and all serving in my opinion to make an uncertain basis of division.

Q. Mr. Gray, that is for the purpose of dividing the expense between the local and the through trains: in that connection, there are certain of these divided between states on a car mile basis.

I want to call your attention to that and ask you if the conditions in different states in which a system is operating would or would not be similar as between one state and another, and if
4422 there would be greater similarity of condition and a better reason for dividing the expenses between states on a car mile basis than there would be as between local and through trains.

I simply mention it to call your attention to it. You see what I want to get your view upon?

A. I do not believe I understand that question.

Q. I understood you to say you did not think, in your judgment, the car mile was a proper basis to divide expenses of through and local trains?

A. To divide the expense of repairs as between local and through trains.

Q. What would you say as to that as the proper method of dividing these expenses of repairs as between two states in which a system is operating—say Arkansas and Missouri; I speak of that because both those railroads operate in both those states.

Is there a similarity in conditions in those two states which would more nearly justify that basis of division than as between local and through trains?

A. I would say there was.

Q. That is what I want to call your attention to, because it will be drawn out and while I do not know your views about that I want you now to express your view as to the merits of that kind of a division between states, as compared with a division between local and through trains: that is the method which has been adopted in this case for dividing between states.

4223 The state's accountant has made an assumption that each local train makes a stop each five miles and each through train makes a stop for each 20 miles: That assumption is based upon the evidence of operating men of the Iron Mountain Railway and we have no complaint to make of it.

Now, for the purpose of ascertaining the relative expense, the accountants have in determining the starting and stopping expenses, multiplied the local car miles by four, in order to account for the more frequent stops of the local train. Then they have in addition to that assumed that each car in local service requires two terminal handlings, to each terminal handling of a car in through service.

Now, I wish you would look at that and state if you think a sufficient allowance has been made there for stopping and starting of cars in local service?

A. There is as wide a variance as it is possible to conceive between two similar things, between a stop of a local train and a stop of a through train; in every day practice.

The stop of a through train is most frequently for transportation or operating reasons; that is, it is a stop to take a siding for or to meet and holding the main line for the opposing train. It is usually unaccompanied by any more work than the taking of
4424 the side track or holding the main line while the other train takes the side track.

The local freight trains perform the greatest amount of *its* functions in connection with a stop of that kind. It may be hours' duration, or it may be short. It is all dependent upon the work required at that local station, as differentiated from the through train which has no work whatever to do.

I would say that an allowance of four times, which is predicated solely upon the fact that the stops are four times as frequent, is wholly unfair. I am not prepared to say what it should be, but it should be several times that.

Q. Several times that?

A. Yes, sir.

Sub-division "C" provides for the division of supervision and general expenses in maintenance of equipment department on the basis of the direct charges which have been previously determined by the methods which have already been criticized.

In division three it is sought to divide traffic expense on a basis of straight revenue.

My criticism of this is that it has abandoned one theory and adopted another.

I do not see how it is possible to start out on an assumption following physical conditions and to swap to that of income.

I do not criticize the method, which is perhaps a fair one and, everything else aside, would not cut a great figure one way
4425 or the other; but I do feel it is not consistent to use one method upon a part of the expenses and another method upon another part of the expenses.

Q. In other words, you think there is no more reason for apply-

ing the car mileage basis to maintenance of way than there would be to traffic?

A. That is my theory.

Q. And, as I understand you, you do not think that is a proper method of dividing either one—that is, the car mile basis?

A. No, sir, for the reasons I have stated.

Q. The next sub-division is "Transportation expenses" and the first item is "Station expenses."

A. Sub-division "A" is "Station Expenses."

We have now still another method of dividing. This is stated not to be a train expense, therefore, a straight division of this expense between intrastate and interstate on the basis of tons of each class of traffic, doubling the intrastate tons as an allowance for two terminals, has been adopted.

Q. In that connection, before you proceed, perhaps it is as well I should call your attention to the fact that in a later exhibit filed by the state, after this one, they have excluded trans-state tons from this division; and the division now rests upon intrastate and interstate, excluding trans-state tons.

A. That again is rather decidedly admitting the weakness of the matter, in that they have eliminated only the weakest feature.

4426 But their action still further accentuates the fallacy of this position (indicating Exhibit) because it assumes there is no station expense in handling the trans-state tons.

The whole difficulty of this theory (indicating exhibit) is its assumption, first, that it does not cost anything in station expenses to handle an overhead or trans-state ton:

Second, that it costs in station expense as much for moving a ton mile as it does for moving 50 ton miles, in proportion or perhaps I had better state that instead of ton miles, a ton one mile as contrasted with one ton 50 miles.

That the cost of handling forwarded business per ton is the same as the cost of handling received business per ton. While practically there is a great difference and distinction.

A forwarded ton is billed by the agent; he is not even responsible for the correctness of that bill or the rate used.

He is also responsible for the correct accounting and the application of the correct rate, upon all business received.

It assumes there is no difference in the station expense of handling a ton of brick or coal, carloads, as contrasted with a ton of classified merchandise, the one involving a very minor amount of work, the other involving an intricate knowledge of rates, of accounting, and handling. It is further subject to criticism in my opinion, in that it assumes that it costs only twice as much to handle a ton which has two terminals as contrasted with the ton which has only one terminal.

Q. That being divided on the basis of tons handled at stations, and not ton miles?

A. Yes, sir.

4427 Q. Is there anything further you wish to add to that?

If not, I call your attention next to sub-division "B," Yard and Terminal Expenses.

A. These expenses are predicated upon the cars handled, and are subject to the same criticism exactly, on account of the great distinction between the work involved in handling different cars, that I have made in the matter of sub-dividing maintenance of locomotives.

Q. By a later exhibit filed by the state in this case, they have made some change by eliminating in the account 25% of the cars in the through trains: would that in your judgment cure the defect?

A. That is an arbitrary deduction, not based upon anything in my experience.

Q. Look at sub-division "C," fuel and locomotive expenses: and state what you think about the assumptions upon which that is apportioned between local and through trains, on this exhibit of the St. Louis Iron Mountain & Southern Railway Company?

A. It is the application of six months' operation on the Iron Mountain with its varying conditions—branches and main lines—with a test made upon another railroad, without any comparison being given for the benefit of the witness, as to the engines used on the Cotton Belt as distinguished from the engines used in the several classes of services on the Iron Mountain; and no information as to the relative number of cars handled on the two
4428 railroads, the length of the local such as the amount of work done by the two; and my conclusion is that it is not a fair basis upon which to divide the expenses of the Iron Mountain road.

Q. You have observed that the test on the Cotton Belt was made in another year; that is, October, 1908, for the purpose of applying it to the month of October, 1907, on another road: do you think that would be a fair method of testing?

A. No, sir. It only further accentuates the fact that it was made at a time of normal conditions, when local freight was performing such functions as it ought to in ordinary practice, handling a much less proportion of tonnage than it would if handled during a period of congestion; and not improbably a different type of engine was used.

Q. It would be objectionable, even on the same line of road, would it not, to measure a period of one year by a period in another one year?

A. It would be, especially two periods of such varying conditions as October, 1907, and October, 1908.

Q. The next subject is Engine House Expenses.

A. That is divided upon an engine mile basis and in addition 12% has been given to the local engine miles, on account of the fact that the local engines have a shorter average run, which I presume from these figures here is 12%: is that correct?

Q. Yes.

4429 A. This is misleading, but I must admit I do not know to what extent.

It is not a fair assumption, in my experience, to say that a local engine needs no more attention per mile than a through engine.

My observation would be that it needs a greater amount. Its firebox ordinarily is in worse condition. The engine has been subjected to harder usage; it has been longer per mile on the road and therefore, dirtier per mile.

I would say there is a considerable excess cost here, but just what I do not know. I believe, however, it is more than has been allowed.

Q. The next branch is "Road Enginemen and Trainmen."

A. Road enginemen and trainmen, it has been stated, have been accurately apportioned for the month of October, 1907. And this apportionment as applied to this abnormal month has been applied throughout a six months' period.

That is subject to the same criticism I have given to all conclusions which use this month as a basis for a six months' period.

Q. I want to call your attention (probably you know it but I have the statistics before me) to some of the matters included in there as follows: wrecks, stock killed, damages to persons and property; flood damages; road signal men, crossing watchmen. Also freight car lubrication and other train supplies:

You might take this paper which shows the railroad sta-
4430 tistics.

A. (After examining paper.) This is another account which uses the month of October, 1907, as a basis for a division for a six months' period, between local and through, applying the train miles as the factor.

It seeks to divide, for instance, freight car lubrication on a train mile basis. It assumes that the lubrication on a ten car train is the same as lubrication on a 40 car train, per train mile.

That the train supplies are the same for one class of trains as for another.

It divides the injuries to persons upon a train mile basis, while the experience which I have had would make the proportion of injury on a local train mile very much in excess of a through train mile, due to the greater hazard attendant upon switching, attendant upon coupling and uncoupling, climbing on to cars, handling brakes, handling of packages of freight, loading or unloading.

It is not a fair criterion to divide the stock killed and damage to property. Certainly not as affecting flood damage.

It is subject throughout to the criticism that it seeks to apply to a six months' period a separation of train miles applying to a month of exceedingly heavy business.

Q. What is the next sub-division?

A. Sub-division "G" "Loss and damaged freight" is stated to be
divided on a basis of the actual claims; and is the least
4431 objectionable feature except that it uses still another basis
for their theory; it presents objection to me only for that reason.

Q. The month of October, I imagine, or any other month, would represent in the account of the company, only payment made on account of damages that had previously occurred, and the claims for which had been adjusted and made ready for payment?

A. If you will pardon me, Judge, my answer was not responsive.

I should have said that the theory which provides for the actual claims paid being assigned to the intrastate and interstate, in itself does not present objections; but in this case I notice now what I had overlooked for a moment, that the month of October, 1907, has been again used as a basis for a six months' period.

We know in practice that claims paid and taken into account in one month rarely, if ever, reflect the results of that month's operations.

In other words, the claims paid for loss and damage represent previous months and the claims paid in this month would come into future months.

We might have taken here any one month——

Q. You do not mean claims paid; you mean damages accrued?

A. Yes, sir, I mean damages accruing in previous months, sometimes extending into years. The larger the amount paid, the longer the probability of duration of time.

4432 Q. Is there any uniformity in the length of time between the occurrence of the damage and the time of payment of claim?

A. There is no uniformity. Some of the roads—I do not know whether it is true here, but perhaps evidence has brought that out—some railroads recognize that by charging out an arbitrary amount per month, carrying the entire matter in suspense through the entire fiscal year.

Q. That is not done in this case?

A. Then it would be less reprehensible.

That method seeks to make a month representative of a year. That method would be less reprehensible, because if settlements were light or heavy in this particular month it would distort the whole priod.

Q. In order to apply a system of averages, you would have to establish first uniformity in the period intervening between the time the damages occurred, and the time the claim was paid?

A. We sometimes do that and are sometimes fooled and have to take in an excessive amount in the last month.

Q. Proceed with your statement, Mr. Gray?

A. Sub-division "H" is "Supervision and General":

This is a case where they have taken sub-divisions which have been arrived at through the different methods which have been criticised, and have used them to arrive at percentages to represent direct charges.

4433 They still hold to the train cost and car cost sub-divided between local and through, and have now the interstate and intrastate partially sub-divided.

I am unable to harmonize this feature.

In supervision, and general, under conducting transportation expenses, the supervision includes the superintendent and his office, the superintendent of car service or transportation and his office.

I think it is subject to all of the criticisms I have made to the other sub-divisions, upon which it is predicated.

In division 5 is provided for general expenses. And they have

applied the train cost and such locatable intrastate and interstate costs as they have determined up to this time, to a further sub-division of general expenses.

These general expenses are, executive, legal, accounting and auditing.

Certainly the function of the accountant is very greatly affected by revenue. I do not see that it has any relation to trains or train mileage.

I cannot see that the law expenses are in any wise affected by it. Most of their work is in the direction of conservation of the revenue.

I think this is subject to all of the criticisms I have directed toward the sub-division upon which this is finally based.

In sub-division 6 we have arrived at the total operating expense which has been brought down so as to represent four grand sub-divisions, namely, train costs, local and through; and other
4434 costs, intrastate and interstate, the last two being considered locatable.

Now, it is sought to divide these train costs, arrived at by these various methods, upon a ton mile basis, as between local and through.

Q. In sub-division 7 of this exhibit, for the purpose of dividing the expenses between these two classes of trains, they have adopted for local trains 26% and through trains 4.96%:

I wish to call your attention to that deviation from the application of their October percentages?

A. I think this is the most graphic illustration of the incongruities that come up through the application of a six month's ton mile result with the results of the month of October, because we have now dropped down by applying those results, from the 28.51% which you mention to the 26% which is here shown, as applicable to the intrastate business on local trains; and from 5.59% of intrastate business on through trains to 4.96%. Thus indicating that in some of the months throughout the six months' period there was even a very much greater difference than this average would indicate.

The great objection, however, to this method, is the fact that they have used car miles, engine miles, tons, and in practically all instances have applied the October, 1907, results to the six months' period.

And now, to this composite result they seek to apply a further percentage which is predicated upon the ton miles of a
4435 longer period.

The ton miles is the result of computations by the Auditor, and is as unreliable as a divisor for the reasons I have stated.

It is further unsatisfactory because it does not satisfactorily take into account the increased elements of cost as between the handling of intrastate on one hand and interstate and transstate freight on the other hand. One of which and a very potent one, is on account of the difference in haul and the difference in the expense of handling.

Q. What, in your judgment, is the difference in cost of handling intrastate business over interstate business?

Objected to by counsel for defendant as not proper on rebuttal.

Col. MOORE: I am asking that question as a foundation for another one I wish to ask: I can put it in a different way, if you want it.

Q. Mr. Ludlam, one of the state's accountants has testified that under the method adopted by the state in this case, the increased expense of handling intrastate business over interstate business is 87%: State, if in your judgment that is a proper allowance and if it is not state in what respect it is not and why you think it is an improper allowance?

Judge HILL: Let me call attention to this: Mr. Ludlam gave that, or I believe it was Mr. Wharton—as the figures of the cost
4436 as worked out by this exhibit. He was not basing an independent judgment upon that, but gave that as 87% based on this exhibit. It was not opinion evidence but simply mathematical evidence based upon this exhibit.

Col. MOORE: In order to meet the suggestion made by counsel I will state that Mr. Ludlam stated that the result of the figures obtained in the method adopted by the state was to apply 87% increased cost of intrastate above interstate freight, and Mr. Nay figured it out and puts it at 86%.

Now, I will ask you to state whether in your judgment that is a proper allowance of difference; and if it is not, state why and state in what way it fails to make a proper allowance.

Judge HILL: I submit if this were direct testimony it would be perfectly proper if Mr. Gray would go through this exhibit and give his views in regard to it, but this is getting into the direct case on rebuttal, which is not proper.

Col. MOORE: I think there is no impropriety in that.

Judge HILL: I do not think it is a question of impropriety, but a question of legality.

Col. MOORE: That is the only sense in which I considered it, from the standpoint of legality.

A. I do not consider that is a correct allowance. I do not consider it is enough.

Col. MOORE:

Q. Subject to counsel's objection, to be determined by the Court, I will ask you to state what your views are as to the amount of the difference and then state why you think that difference exists
4437 in reference to the figures submitted by the State in those exhibits, and your view as to what the difference is.

A. My judgment for a long time, as the result of giving such study to this mooted question as I could, such intelligent study as I was capable of, has been that the cost of handling intrastate freight business as against the cost of handling interstate and trans-state freight business, under the conditions which prevail in the Southwest, in practically any of the States in the Southwest with which I am familiar, will run from three to five times as much. In the subsequent study I have given the matter I would be inclined, if I changed at all, to raise the range of that cost.

Q. I understand you to mean if you were to deviate from your estimate of three to five you would be inclined to raise?

A. Yes, sir, to raise the five somewhat.

It is such a difficult thing to reach and determine that one has to make as wide a range as possible. It comes about through such a variety of causes and conditions.

Q. It is in evidence in this case in a large amount of testimony introduced by the complainants, that the revenue theory is the proper method of dividing the cost of operation between state and interstate business. You have seen and just gone over the methods adopted by the accountants for the state:

4438 I wish you would state what your views are as to the relative merits of the two methods of division.

Counsel for defendants object to the introduction of testimony from this witness, in rebuttal, as to the revenue theory. (Here follows colloquy.)

Col. MOORE: I will change my question.

Q. What do you think of the merits of the plan adopted by the State's accountants for ascertaining and dividing the relative cost of handling interstate and intrastate business?

A. I feel it is an unsatisfactory basis for the reason that it is not a consistent theory. That is, not consistent to itself; in that it has used a number of varying methods. Those methods being the car mile, ton mile, arbitrary assumptions as to the relation between the locomotive mile and the car mile; and that it has applied over a six months' period a result determined upon in one month; and that result in itself and in the nature of things is an unsatisfactory one and an indefinite one.

That at any point throughout its deductions an error or a switch of the business in the other months would very materially affect the final result.

That it is objectionable because it is difficult of understanding. It assumes conditions which in practice we are not able to verify.

4439 But, above all, remains the fact that there is not a proper allowance that has been made for the relative cost of the two classes of business.

Q. Mr. Gray, speaking of this plan of separation from the standpoint of the State, as to the arbitrary that has been allowed in these various sub-divisions, for instance, maintenance of way, they have made an allowance of fifty per cent to local trains on account of station switching; and in maintenance of equipment they have added fifty per cent to the mileage made by the yard locomotives for possible maintenance due to yard switching, to which has been added an additional fifty per cent for possible extra maintenance due to switching service.

And in maintenance of freight cars there is an allowance of four to one in favor of local trains on account of more frequent stops made by the local than the through trains.

That enumeration will illustrate what I mean by the arbitrary assumptions.

If those arbitraries were correct and there was any way to arrive at what division would be proper and you could say these allowances would be proper in favor of the local trains, would that account for the excess cost of handling intrastate over interstate freight?

A. No, sir.

4440 Q. Mr. Gray I will now call your attention to Exhibit M in this case, in which an attempt has been made to divide the expense of passenger traffic:

The State has in that exhibit departed from the method adopted in regard to freight and has not sought to segregate that class of expense as between local and through trains, but has used the car miles of the trains:

You have been over and examined that exhibit, have you not, Mr. Gray?

A. Yes, sir.

Q. Will you take up that exhibit before you and begin with the beginning of it and call attention to such parts of it as you desire and state your views about them.

A. In the deductions throughout this theory, starting in with maintenance of way and structures, the car mile basis has been adopted entirely.

Why the locomotive mileage has been dropped, although used in freight statistics, it is hard to understand; especially as the proportion of locomotives to cars is very much greater in passenger than it is in freight.

The coach, Pullman, mail and express car mileage has been set up and from those the percentages have been reached and the expense of maintenance of way and structures for six months divided upon percentages found to have been applicable in October, 1907.

4441 This is objected to because no consideration has been given the locomotive, because it assumes that the expense of maintenance occasioned by the passage over the rails of a coach is the same as that of a Pullman, or a mail car, or of an express car.

All of the Pullman cars, a very considerable and increasing proportion of the coaches, have six wheels per truck; most of the mail cars and by far the greater proportion of express cars, have four wheels to the truck?

The theory is objectionable because it applies to the longer period of six months the car mileage of October, 1907.

But it is objectionable principally because it seeks to apply percentages to an expense, the greater proportion of which is fixed, and not affected by the flow of traffic.

Q. What is the next division?

A. In division No. 2 "Maintenance of Equipment" it is sought in sub-division "A" to divide the expense of repairs to locomotives on the car mile basis:

It is impossible for me to conceive any relation between these two and I have never known of its being used. It must assume, to justify itself, that the repairs to a locomotive hauling a three car

train, are one-third of the repairs to a locomotive hauling a nine car train—which is wholly incorrect.

It eliminates the question of the relative damage occasioned
4442 by the different classes of service, local and through, which heretofore has been considered.

Sub-division "B" covers repairs to passenger train cars:

These repairs have been apportioned to coach, mail car, express cars, on a car mileage basis.

May I ask if that is actual mileage for the period or is this the month of October, 1907?

Q. This is the month of October, 1907, as I understand it.

A. This is not dependable for the reason that it assumes the repairs to a coach are the same as those to a mail or express car—which is not correct.

It is further objectionable because it has assumed a proportion of express car mileage to the total in the month of October, which is improbable as applied to other months of that period, when fruit and perishable stuffs are moving, and there must be further an arbitrary deduction because there are other classes of cars which are not included; for instance, combination cars, which must have been arbitrarily thrown into one or the other of these mileage figures. Such assumptions are necessarily arbitrary, whatever they are.

Q. There is one other thing I want to call your attention to: it is in evidence in this case that the interstate passengers are
4443 carried largely on local trains: it is also in evidence that local trains stop much more frequently than do the through trains: would not there be an increased expense in starting and stopping applicable to the trains that carry the local passengers, which is also unfair as a basis of division, as between those two classes of passengers.

A. I have not gotten to the point yet where it is sought to divide it between them.

Q. I did not mean in the general division, but I mean in dividing the expense between the cars that carry these passengers, if you wanted to get at it on this method, should you not, instead of doing it by the cars, ascertain the expense of service connected with those cars?

A. No, sir, that is not applicable to this sub-division, because this is just a division between coach, mail and express car miles.

Q. I just wanted to call your attention to it. Pass on them to the next.

A. Sub-division "C" provides for the application of percentage brought about by the four classes of car miles, and those percentages are used to divide the supervision and general expense appertaining to maintenance of equipment.

I want to explain that in this account has undoubtedly been included all of the shop expense, repairs to and use of tools, fuel, the mechanical supervision of shops and terminals; and it is sought to apply this car mileage, irrespective of locomotive mileage, or aside from considering the locomotive as a factor.

4444 I want to say that it is not an over-statement to say that in the shops 90% of the tools are provided for and are used in connection with locomotive repairs; that the expert men who are selected for the mechanical department are chosen because of their familiarity with machinery or locomotive repairs and maintenance; that 90% of the detail drawings made by the Motive Power Department employees, and 90% at least of the accounting handling by the office force, and the general correspondence and records, has relation directly to locomotives.

There is not the same degree of intelligent supervision required with regard to coach repairs.

And when it is sought here to eliminate the most important feature of the supervision and the use of the shops, it makes a very unsatisfactory sub-division.

Q. What is the next sub-division?

A. In division No. 3 "Traffic Expenses," and I would say practically the whole objection to this division is the fact that it has introduced into an equation already proceeding along another line, an entirely different basis, in that the gross earnings have been applied.

I do not contest their fairness, but I do feel that its introduction into this problem renders the whole inconsistent.

Q. I want to call your attention to the fact that this third
4445 sub-division, "Traffic Expenses," has included mail and express, and charged 19.33% of that expense to mail and express jointly:

Do you think it is proper to charge that expense to those cars?

A. I have tried to express that in my criticism.

As I say, if the theory were consistent with itself, I would have no objection to that.

But to set out in this one account alone and apply the gross revenue, to arrive at percentages and charge in the one element of expense alone, this amount against mail and express cars, is unfair, in my opinion.

Q. As I understand it, that represents commercial agencies, and things of that sort; agencies to hunt up business; and that expense is not incurred for the purpose of getting mail or express business by railroads, as I understand it.

A. It is so small as to be infinitesimal.

Q. Go on to the next item.

A. Division 4 of "Transportation Expenses" sub-division "A" covers station expenses and this is divided between intrastate and interstate business on a basis of the number of passengers of each class handled, after first making an arbitrary deduction of ten cents per day for the handling of mail at certain stations; and as-
4446 suming further that the intrastate passenger uses two terminals as against an interstate passenger's use of one:

My criticism of this is that it primarily assumes that the station cost of handling intrastate passengers doubles, which is not carried through any of the other sub-divisions.

Further, it assumes that an intrastate passenger occasions only

twice the expense of an interstate passenger, which is wrong, for this reason.

In order to intelligently answer that question I want to ask what is the average haul of these interstate and intrastate passengers.

Mr. JOHNSON: The average haul on the Iron Mountain of state passengers is thirty miles, and of interstate passengers 118 miles.

The average haul on the Cotton Belt of state passengers is 23 miles, and of interstate passengers 12 miles.

Mr. GRAY: Is this ten cents a day an assumption, or is it supported by evidence?

Judge HILL: It is supported by the evidence of Mr. Teachout, the General Mail Agent of the Iron Mountain, who testified before the Postal Commission in Washington, that that was the proper allowance, and our accountants accepted him as an authority on the subject.

A. I would not agree with Mr. Teachout that that is a fair allowance. I think it is a violent assumption, because at
4447 some stations we handle mail across the road, and the mail does not amount to much. At other stations we handle it in some proportion of eighty rods and it is very heavy.

This necessarily assumes that except for the allowance on the terminal, the passenger who traveled 30 miles costs as much in proportion as the passenger who travels 118 miles, on the Iron Mountain; or that the intrastate passenger who traveled an average of 23 miles as against the passenger who traveled an average of 121 miles on the Cotton Belt road. This, in my opinion, is unreliable because in the 118 miles on the Iron Mountain and the 121 miles on the Cotton Belt are a large number of passengers who did not use the stations, or station employees, at any point in their transit through the State.

It is a fact that that the intrastate passenger will average a greater amount of damage to baggage. It is more frequently a commercial salesman who makes short trips inside the State, with a large amount of baggage.

It is a fact that a passenger going five miles will use every portion of the depot facilities, baggage trucks, the length of the platform and the scales; and that the passenger going 300 miles will board the train with his valise.

I think it is fair to say that is an extreme of the two, but
4448 it is representative of what we find in our business every day.

With the short haul comes the greater proportion of the expense. The shorter the one haul is, the greater the other haul becomes, and the greater becomes that difference in the expense.

I want to say before I leave this one article, that of all the divisions which I have had occasion to criticise in this matter, this is the closest approach to being somewhere near a correct allowance. It is unfair only when taken in consideration with all the balance.

Q. I want to call your attention to the items that are embraced in yard and train expenses. Look at this paper and state what is embraced in those.

A. This expense includes——

Judge HILL: To what are you referring?

Col. MOORE: Mr. Nay probably testified to it, and I want Mr. Gray, if he knows, to state whether that is correct.

Judge HILL: What I want to know is what you are putting before Mr. Gray as contained in that heading. If it is an exhibit refer me to the number, and if it be testimony refer me to that.

Col. MOORE: I handed this paper to Mr. Gray for the purpose of asking him if those items are included in that.

A. I cannot do that Col. Moore.

Q. I will ask Mr. Johnson.

4449 Mr. JOHNSON: Those items make up the $549,069. It is merely an analysis of the different items.

Judge HILL: That is what I want to get.

Mr. JOHNSON: You want the items?

Judge HILL: Yes.

Mr. JOHNSON: Yard and train expense under the heading of passenger service includes the following items——

Judge HILL: Is that the Interstate Commerce Commission classification you are using?

Mr. JOHNSON: No, it is the classification used in this case:

| | |
|---|---|
| Yard service | $15,124 |
| Train and engine men | 182,772 |
| Fuel and other train supplies | 135,712 |
| Care of passenger cars | 50,600 |
| Engine house expenses | 46,499 |
| Wrecks | 17,879 |
| Injuries to persons | 56,128 |
| Damage to stock and property | 39,264 |
| Miscellaneous items | 5,088 |
| The total is | 549,069 |

These items are made up from the Interstate Commerce Commission classification primarily, and then adjusted to meet the Missouri Pacific classification, as has been explained already in this case.

4450 Mr. GRAY, resuming:

A. (after examining statement): This portion of the expenses is divided under this theory by assigning to the coach, Pullman, mail and express in the proportion that the mileage of those classes of cars bears to the total mileage of all the passenger cars.

It eliminates the locomotive as a factor, although it includes injuries to persons, in which the locomotive cuts a very considerable figure.

It divides engine house expenses on a car mileage basis, which assumes it costs three times as much to clean, knock the fire, and possibly fire up on an engine which had handled nine cars as it does on an engine which handles three cars—which is not true; that the proportion of fuel and the proportion of train and engine men

does not bear a true relation to the number of cars handled, but more particularly to the class of engines used.

Train men being largely paid on the train mile, engine men on the engine mile, but subject to variation according to the type of engine used.

It is erroneous, in my opinion, as affecting yard service, because one train of four cars will frequently receive more attention at the terminals in the way of switching than will a through train of nine cars.

It applies a car mile proportion to wrecks, which in the shape of passenger trains at least is not affected by the number of
4451 cars handled. Our experience being that so far as derailments are concerned, at least, by far the greatest percentage is due to derailments of the tender, which is a part of the locomotive, and which has not been included in this computation.

Sub-division "C" seeks to divide the lost and damaged baggage between the intrastate and interstate in proportion to the gross earnings of each: it seems to me if it were desired to be specific, here is one item which could be.

But it is chiefly objectionable, in my view, because it employs another factor or method which is injected into a theory, that is not consistent with it.

Sub-division "D" provides for a division of all the remaining expenses, supervision in general, on a basis of what purports to be two charges, which includes the car mileage, as I have already enumerated, and cetrain expenses which are assumed to be directly chargeable to intrastate and interstate; and from this another percentage has been arrived at.

This account includes the cost of superintendence of transportation; salaries of the Superintendents; a portion of the salary of the General Superintendent, and their respective offices; all of the Superintendent of Car Service or Transportation, with their offices:

Now, to apply this theory we have got to assume that in
4452 this supervision, where the dispatchers deal entirely with trains as units, where the Superintendent of Transportation and his clerks deal entirely with cars as units, that the expenses are to be sub-divided upon the car mile basis.

I think it is well to say in passing this sub-division, that a good proportion of those expenses is for dispatching and it has no relation whatever to the car mile.

One of the principal objections, however, is the fact that this is built up out of conditions which it seems to me are subject to criticism for the reason I have given, and that the percentage now arrived at is from a variety of causes, which have no relation to each other and are not one hundred per cent of any one thing.

In division 5 it provides for the general expenses, and that proportion of the general expenses chargeable to passenger is sought to be divided upon still another per cent, which is the result of an addition of the last percentages to those of each account.

If the car mile basis is not proper, for the reasons I have stated, it applies with greater force in the last two, numbers four and five,

because they have been distorted at the foundation, and the inequalities are even greater at this stage.

In divisions 6 and 7, having reached this point where we have coach, intrastate and interstate, it is sought now to make a
4453 final division of the cost of coach and Pullman service, which has heretofore not been divided between intrastate and interstate business, using as the divisor in this case the percentage of the passenger miles of each class of traffic for this six months period:

The objection to this is, the same as I have urged to the preceding paragraph, it has all of the objections which I have urged to the car mile basis; it is in my opinion valueless because in this percentage has been placed the passenger miles which were handled in Pullman cars and which were handled in caboose cars.

Q. You mean passengers?

A. Yes, sir. The passenger miles which were handled in Pullman cars and which were handled in caboose cars, and which must have been an unknown quantity.

This division presents the further objection that in its last analysis there is no consideration given for extra cost of service intrastate versus interstate.

It proceeds further to divide cost of Pullman service (which has been previously arrived at on a car mile basis), upon an arbitrary assumption that 25% was intrastate and 75% was interstate.

I am not able to say whether this is correct or incorrect; nothing in my experience would justify either figure conclusively or with sufficient accuracy to divide over $300,000 worth of expenses.

4454 In division 8 the results of these various computations are carried and added to the cost of the intrastate and interstate which had been previously located.

The mail and express business has been charged in that proportion of the total cost which the mileage of the mail and express cars bears to the total car mileage.

It must be remembered that the mileage used is that of October, 1907, being one month of the six months' period.

In this division is a proportion for the miscellaneous revenue, taxes, rentals, hire of equipment, dining car deficit, value of property, and the gross revenue has been used in determining these:

My comment on that would be that it is not a consistent theory which swaps from one basis to the other, and that under certain conditions the allowance by the state in this case would be unfair to the state; while under other conditions it would be unfair to the railroad; that it is chiefly objectionable from the fact that it is not upon the same basis as the major part of the theory.

The chief result of these theories in the passenger side of the expense is in the result, and I think it is fair to judge by that.

Take, for instance, the matter of express earnings: if there is any department of the railroad's income that represents the least expense to the dollar received, it is the express business.

4455 The determination of the space allotted in the train upon which this express is carried is determinable by the railroad.

Ordinarily an express contract provides that the Railroad Company shall allow space at the stations, if it has the space to spare. No contract that I know of expressly provides that the Railroad Company must furnish this at its expense, as in the case of the mail; there is no arbitrary allotment of space on a train for the express as in the case of the mail. There is no arbitrary allotment of space at the stations. No railroad employee is required to handle a pound of express, as is the case with mail, where the distance is less than eighty rods from the post office, or as is the case at transfer points, where the entire cost is borne by the railroads.

And yet the deduction which this theory finally results in is that it cost $172,475.77 to earn $133,910.82.

Q. Does this method of division of passenger expenses between intrastate and interstate passengers, if it were correct in principle, provide for the increased expense of intrastate passengers over interstate passengers?

A. It does not, in my opinion.

If you will permit me to say, Judge Moore, it is further objectionable because in the manner of reasoning employed there has
4456 been an undue amount of expense attributed to the miscellaneous earnings, such as mail and express.

4457 Cross-examination of Mr. CARL R. GRAY.

By Judge HILL:

Q. It seems you have approached these exhibits from a little different viewpoint from what they were put in. I gather from your statements that you regard these exhibits as an attempt to absoluely divide all traffic between local and through and subsequently between state and interstate, as something of an ironclad rule on that subject, do you not?

A. I do not believe I understand that question, Judge Hill.

I regard these (indicating exhibits) as setting up certain conditions and assuming certain arbitrary conditions as facts, which in their nature are hard and fast.

Q. I want to call your attention to the testimony of Mr. Wharton, at the time he put in his exhibits, explaining the plan upon which the work had proceeded:

He said "From the reading of the testimony in the Missouri Case and my understanding of the purport of that testimony, it appeared all the time that the differences in the cost of state and intertsate business were mainly the differences in the cost of local and through trains. The witnesses all seemed to testify that way and we determined that if it was possible we would work up statements showing the cost of local and through business and after getting that cost, we would ascertain in the best manner
4458 possible the cost of state and interstate business carried in the two classes of service; in that way getting away from any question of theory, but getting down to an application of the facts and of the testimony given in that case and subsequently given in this case."

So you see from that it is an attempt—whether successful or not I will discuss with you later—but it is an attempt to apply this formula to the testimony that had been given in this case.

A. I do not agree with that, except in part.

The testimony that I gave and heard in the Missouri Rate Case, did regard the local freight train as a very material consideration, but never as wholly fundamental; and only as one of the incidents affecting the excess cost.

Q. That is true of your testimony which is given in that case, but I want to call your attention to the testimony given in this case:

You know Mr. Doddridge, do you not?

A. Yes, sir.

Q. You know that he has been General Manager of both the railroads that are parties in these proceedings, the Iron Mountain and the Cotton Belt?

A. I remember that.

Q. You would regard him as qualified to speak for operating conditions on the Iron Mountain and the Cotton Belt, would you not?

A. As to operating conditions, yes.

Q. Here was his attitude in this case:

At page 28 of Volume 2 of the printed record he was asked these questions:

4459 "Q. You were employed by the Missouri Pacific in the Missouri Rate Cases, were you not?

A. Yes.

Q. You attended practically all the sessions of that hearing, did you not?

A. I attended a great many of them; I did not attend all of them, but a great many of them.

Q. You were in constant attendance at those hearings, though, whether in daily attendance or not?

A. Yes.

Q. You acted in an advisory capacity towards the counsel and the other expert witnesses in that case, did you not?

A. I acted as an advisor to the counsel and discussed some of these questions with a good many of the witnesses.

Q. You have occupied the same relation in this case, have you not?

A. Well, yes, but I have not had any conferences with any witnesses in this case."

Now, a witness occupying that position in this case and putting forth his opinion, would not you think the state would be entitled to rely upon that?

A. That is hardly a question I could answer. I do not know what Mr. Doddridge's opinion may have been. If I am given his opinion I will comment on it.

Q. I will give you that directly, but before we get to that, I am asking you if in making up these exhibits, if you take the statements of a witness who has had the experience Mr. Doddridge has, and who testified as he did here which I have just read you, that he acted in

an advisory capacity to the counsel in both the Missouri
4460 Case and this case, that the state would be justified in taking his opinion in preparing their exhibits, would they not?

A. I still want to say I would express my opinion of Mr. Doddridge's value in this manner purely upon operating conditions. I believe he is familiar with the operating conditions as they obtained on the Cotton Belt and on the Iron Mountain road at the time he managed those railroads, but I do not believe Mr. Doddridge is in any better position by virtue of his managing those properties, to testify in the matter of a division of cost or a matter of the method of arriving at that than any one of the operating officials of today—perhaps not quite so much.

Q. That is getting away from my question—unintentionally I am sure.

A. Yes, if I have done so it is unintentionally.

Q. My question is not how you would view Mr. Doddridge, but I ask you if the state would not be justified, in view of the relation which he occupied to these roads and to these cases, to accept his statements given as a witness in these cases, to prepare exhibits from? I am asking you from the viewpoint of the state and not from your viewpoint?

A. I would say that the state is justified in giving weight to a statement made by Mr. Doddridge.

Q. Mr. Gray, I want to read to you from Volume 2 at page 59 of the record, from Mr. Doddridge's testimony, as follows:

"Is not the only difference in cost of the intrastate and
4461 interstate freight carried on the same train, the one of the extra terminals?

A. There is no difference in the cost of one kind of freight or another kind of freight, arising from a distinction in the terms "state" or "interstate."

If the conditions are the same there would be no difference in the cost.

Q. Take freight carried on the same train?

A. Well, I say, if the conditions are the same; that is, the kind of freight, and all of the other elements that enter into it, there would be no difference arising from the terms "state" or "interstate." But the conditions must be the same to say that there would be no difference in the cost, because there might be difference in the conditions. The character of the freight, the weight, and other things.

Q. Take it, the same kind of freight and of the same character, carried on the same train, where is the difference, except in the terminals?

A. There would be no difference in the train cost."

I want to read to you from the testimony of the Frisco case:

"So far as the particular freight is concerned, carried on those particular trains, there would be no greater cost in transportation for interstate freight than state freight, except the terminal charge.

In order to ascertain the results correctly, you would have to take into consideration the amount of state freight that is carried upon

that train, as applied to the total state freight carried on the other train.

In other words, what I mean to say is, we have to take into consideration all the trains and find out what relation the state freight bears to the whole."

And then Mr. Doddridge was asked this question:

"That is a correct analysis, isn't it?

A. Yes, sir, I think so."

4462 Q. Do you agree with that, Mr. Gray?

A. No, sir, I do not.

Q. You do not regard that as correct?

A. No, sir.

Q. You know Mr. I. G. Rawn?

A. I knew him quite well.

Q. He was an operating man of a great deal of experience, was he not?

A. Yes, sir.

Q. Mr. Rawn said at page 368 of this record:

"For the purpose of determining the cost of operation of tranportation, the question of state and interstate traffic is not the method of consideration. The method is that of through and local business."

Would you agree to that proposition, Mr. Gray?

A. Not without qualification.

Q. Without taking up in detail the testimony of other witnesses introduced by the railroads, I will state that Mr. Edmund D. Sewell, and probably two or three others, I do not recall them all now, testified in substance the same thing. That there was no difference in the state and interstate per se, but the difference was in the character of the service, whether it was local or through; and in order to determine state and interstate you had to ascertain the local and through and the proportion of state and interstate on the local and through trains.

Do you agree to those propositions?

Mr. MOORE: I want to state in connection with that, that

4463 while I do not object to it as an assumption on your part, Judge Hill, I disagree with yau as to your understanding of the effect of the testimony.

Judge HILL: That is the way I understand the testimony and I put it that way as my understanding of the testimony.

Mr. MOORE: I don't want my silence to imply that I agree to that because I have a different understanding of the testimony.

A. My answer is that if the position has been taken by those gentlemen, that there is no distinction between interstate and intrastate freight, that does not equally apply to the through and local, that I dissent—I do not agree with them.

Q. You spoke several times yesterday of the inconsistency of the state's accountants in various ways:

I will ask you what you think of the inconsistency of the railroads in this case, putting Mr. Doddridge and Mr. Rawn on the stand and

proving these facts and then putting you on in rebuttal to take a different view of the same proposition?

Col. MOORE: I do not concede that the railroads have taken different positions. You are arguing with the witness.

Judge HILL: I am asking him about the views he expressed yesterday and I have read the testimony of Mr. Doddridge and of Mr. Rawn.

You disagree with that, Mr. Gray?

Mr. MOORE: You have read only scraps of the evidence.

4464 A. I disagree with what you have read of their testimony, if it is without qualification.

Judge HILL:

Q. Going back to the consistency of their position: after having heard that testimony what do you think of the consistency of the position of the railroads in putting them on and then putting you on and proving a different state of facts?

A. Your statement that they have proven anything by me, is a compliment to me.

I say in a situation so complex and so unnatural as this, it is not a surprise that the railroad men might disagree.

Q. That still does not answer the proposition of the inconsistency of the railroads, does it?

A. I do not know that I can comment on the consistency or the inconsistency of the handling of this case by either side.

Q. Did you not comment on it yesterday?

A. No, sir. I commented only upon the consistency of this theory with itself (indicating exhibit); or its inconsistency with itself and not on any attitude of the state or of the railroads.

Q. Is not that the same proposition here, where you see testimony of the witnesses introduced on behalf of the railroads, that express different views on those subjects from those you express?

A. Is it competent for me to comment upon that?

4465 Q. I don't know whether it is or not, but you commented upon a similar thing yesterday and if it was competent yesterday, it is today.

Col. MOORE: I object to the question as putting the witness in an attitude that I think is really not proper.

Judge HILL: You opened up this thing.

Col. MOORE: It bears no resemblance to the comments made yesterday by the witness upon the exhibits because he was contrasting or comparing one feature of the exhibit with another feature of the exhibit; and was not commenting upon the consistency or inconsistency of the management of the case.

Judge HILL: I am not referring to the management of the case but to the inconsistency of the positions taken in chief and in rebuttal.

Do you think they are consistent, in view of what I have read you here?

A. We are consistent, I think, to a certain point.

I do not believe the witnesses you have quoted have gone as far as they should have gone in considering this question.

Col. MOORE: You are confining that to what has been read to you?

A. Yes, sir, I am confining it to what has been given to me.

By what you say they have assumed to take as a fundamental what I regard as only one of the incidents.

Mr. HILL:

Q. Mr. McPherson testified in this case—I suppose you
4466 know Mr. McPherson?

A. Yes, sir.

Q. You know his relation to the Iron Mountain road?

A. Yes, sir.

Q. Mr. McPherson testified, as I recall his testimony, that there was no difference between state or interstate in itself. There was no magic in the state line; and that it resolved itself into a proposition of extra terminals and long and short haul: do you agree to that?

A. I agree to that a little more than I agree to the other statements you have read, because I think he is bringing in some of the other elements.

Mr. MOORE:

Q. You have not stated anything like all of Mr. McPherson's testimony. He spoke of the difference between car load and less than carload and a great many other elements that should be considered.

Judge HILL: I can turn to his testimony if you wish?

At page 398 Mr. McPherson was asked this, after going over this question of facilities and other matters:

"Your reasoning then, in its final analysis, places the difference in these classes of traffic, intrastate, interstate and trans-state, upon the difference in the length of haul and the use of the facilities—terminal facilities, I mean?

A. And the consequences.

Q. Well, that would be included in it, I take it. There are no other factors now that have influenced your judgment in this matter?

A. Yes, there are many other factors that have influenced
4467 my judgment.

Q. I would like to have them.

A. I don't know that I can reduce them to figures. They are matters of observation."

That is the substance of his views: do you agree to that?

A. I agree to it so far as it goes.

I think he has stated correctly the distinctions, but, if he has assumed that any of those alone are fundamental, I do not agree with him.

Col. MOORE: He has not done that.

Judge HILL: That is a difference of opinion. It is too tedious to take it all up in detail.

Q. Mr. Gray, you spoke yesterday of the lapovers, one might call them, where you would use one month's figures. I understand that this month of October, 1907, which exhibit was put in by the railroads, and which was subsequently used by the state, was an analysis of one month's business: you object to the use of one month in the way it was used. That is, of ton miles of freight on the local trains obtained from the conductors' wheel reports and waybills and then deducted from the total tonnage of the freight accounted for in the Auditor's office during that month, to thus obtain the ton miles of the through trains. That is what you objected to, was it not?

A. Yes, sir.

Q. Now, it seems that the railroads in making this ex-
4468 hibit took all of the system waybills dated in October, and on interline forwarded they took all such as were reported from all stations to other lines; and on interline received they took such as the agents reported as received as October business.

A. That is right.

Q. That would leave lapovers, would it not?

A. It would leave lapovers in interline received as well as in interline overhead.

Q. The inaccuracy in this statement would be in the railroads' compilation in this way, and not inaccuracy in making up the intrastate from the conductors' wheel reports, would it not?

A. The accuracy in this deduction is in what you mention, the information from the conductors' wheel reports.

Q. That is an accurate factor, and factors made up by the railroads in the way I have read you here, which you recognize as correct, is where the inaccuracy would be? That is, you mean so far as the actual movements of the freight would be concerned?

A. I mean, it is inaccurate as applied to the results of that month.

Q. Now, Mr. Gray, suppose the intrastate revenue for a given period was compiled from journals which were copies of the waybills, which were dated in a given period, so far as system business was concerned; and the intrastate interline which was reported during that month was added, so as to make the total intrastate
4469 revenue: then deduct from the total earnings for a given period this sum, and the remainder represents the interstate earnings for the given period: would the revenue so computed as a true compilation of the revenue actually earned on interstate freight transported during that given period be accurate?

A. It would be accurate so far as money was concerned. It would not be accurate as affects this application even to the operations of that month; and certainly not accurate enough to be used as a gauge for a period of months including that month.

Q. That would have the same objection to it, so far as its effect is concerned as the objection you have heretofore pointed out about this other.

A. I want to be sure that I understand your question, Judge Hill:

You mean the objection I have pointed out for using one month as a basis for determining the results of a six months' period?

Q. Yes.

A. Your question now is, does not this present the same objection?

Q. Yes.

A. I say, yes.

Q. You object to the use of ton miles compiled by the Auditor during any period, as not being the ton miles actually transported during that period. The Auditor would compile his revenue
4470 figures from the same waybills that he took his ton miles from; therefore, the Auditor's revenue figure for any period would not be the revenue actually earned on the freight transported during that period: is that correct?

A. I do not want to be misunderstood on that matter, but I object to the Auditor's ton miles figures for October being used as a basis, after deducting from those ton mile figures the actual conditions proven to have taken place on local trains and that deduction of a certainty being made from an uncertainty.

My objection was to the application of that principle throughout a six months' period.

Q. I understand that. But this is going, I think, to the same principle, carrying it to another application of it. That is, you take a given period, whether that given period is one month or six months, two months or three months: if you take a given period to use the ton miles compiled by the Auditor during that period, as represented by revenue, they are not the ton miles that represent the freight actually transported during that period?

A. That will nearer approach accuracy as the term is lengthened out.

Q. That is true. The principle is that you object to any given period being used in that way?

A. Yes, sir, and my principal objection, Judge Hill, as I stated yesterday, is the selection of the particular months, and the
4471 further action of the state experts in arriving at the actual conditions and deducting the exact ton miles from what was not exact, as representative of that month's operation.

Q. I understand that. And I am just carrying that same principle now to this other proposition.

Suppose you took the statistics made up in this way of a six months' period to represent a six years' period: would not that be equally objectionable as representative of six months, as one month would be objectionable as representative of a six months' period?

A. That would depend upon the railroad and the conditions.

I would say that if you apply any deduction to a six years' period it should be deductions based upon the entire years' experience.

Q. The expense of this period is actual. That is, represents the money actually paid out during a given period, say a six months' period.

The revenue derived in the way it has been put to you would be for some freight not transported during that given period, would it not?

A. That is a fact.

Q. There would be freight in that—say it was a six months' period, last half of one year—there would be freight in that transported in July that was billed in June, wouldn't there?

4472 A. Yes, sir, that is right.

Q. And that freight would go into the revenue report for June?

A. Or whenever it was reported.

Q. And on the other end of the period there would be revenue credited to December, when the actual movement took place in January or later; that is, a part of it at least?

A. Yes, sir, that is right.

Q. So, if you take any given period and take the expense of that given period, that expense does not actually represent the cost of earning the revenue that is made up in this way?

A. With this qualification, that the longer the period the more nearly it approaches accuracy.

Q. That is unquestionably true.

That would just make the lap-over thinner the longer the period taken?

A. Yes, sir.

Q. But the principle would be the same, would it not?

A. No, sir, that would depend upon the period taken. That would be affected in the degree that the proportion of interline received and interline overhead bore to the total, and is seriously affected by that.

Q. The principle is all right. It is just a question of degree, is it not?

The principal objection you have made here, applies equally to this revenue and expense, but runs into the question of degree, depending upon the length of the period that is taken?

4473 A. My principal criticism of that, but not my fundamental criticism of the theory;—my principal criticism of that yesterday was, the assumption that the condition in October, 1907, could be used as a basis for determining the results in the last six months of 1907. But that was not my sole criticism.

Q. I do not so understand it. I understood that was just one of your criticisms.

A. Yes, sir, just one.

Q. I believe if I can call it your principal criticism, it was to using one month as being good through a period?

A. No, sir, that is not the principal criticism. That is a strong feature of my criticism but it is not fundamental.

Q. Why is it not fundamental?

A. Because it is only one of a number of objections.

Q. I want to call your attention to some testimony which has been given in this case: you know Mr. Kimbell, the Assistant General Auditor of the Cotton Belt Road?

A. No, sir.

Q. You recognize him as a gentleman who would be qualified to speak of the conditions on his road, would he not?

A. Well, with all respect to Mr. Kimbell I think there are some things on the Cotton Belt that he possibly does not know and could not know.

4474 Q. You would regard him as a qualified witness on conditions on the Cotton Belt, as to revenue and expenses, would you not?

A. As to the money involved and accounting for that.

Q. What is paid in and what is paid out?

A. Yes, sir, I would.

Q. At page 80 Mr. Moore asked Mr. Kimbell this question:

"Did the operating officers of the St. Louis Southwestern Railway Company make a test at any time after this litigation was instituted, for the purpose of ascertaining the relative cost of conducting state and interstate transportation? If so, I wish you would state what was done in that respect?

A. A test of that kind was made under my direction.

Q. What period did it cover?

A. The month of October, 1908. The temporary injunction was granted in St. Paul on September 3rd, and the month of October was selected for the purpose of this test, on account of it being the first full month following the injunction. October is rather a heavy month, but for a test of this kind, in my judgment, it fairly represents the general conditions."

Then Mr. Moore asked this question:

"Q. Would it represent, fairly, a year's business?

A. I should say so. It would represent relatively, the difference between the two classes of traffic."

Do you agree to that, Mr. Gray?

A. Being wholly without knowledge, I do not see how I could dissent from that, my understanding being that Mr. Kimbell has talked there about relative business of the Cotton Belt, this being a representative month as to income, and representative per-

4475 haps as to the relative relation between state and interstate traffic; but I would not imagine he would testify as to conditions on the Cotton Belt Railroad.

Q. I will read you a little further what Mr. Kimbell testified.

At page 92 counsel for the state asked him this question:

"Do you think that one month would fairly represent the business of your line for a year?

A. I think for the purpose of a test of that kind, determining the relative difference between the two classes of freight, that one month is perhaps as good as another.

Q. Why did you select October? A. As explained it was the first full month after Judge Vandevanter granted the injunction. He granted it in September, September 3rd; we wanted to make this test as soon as possible, so we selected the first full month.

Q. In your judgment, a test of this kind, made for the month

of October, would fairly represent the operation for a year, or for a series of years?

A. I should say so."

Would you agree to that?

A. No, sir, I would not.

Q. I believe you expressed yourself yesterday as disagreeing with that principle, did you not?

A. Yes, sir, I do not agree with that.

Q. What do you think of the consistency of the railroads putting their assistant general auditor on the stand to prove these facts and subsequently putting you on the stand to express very different views?

A. They have not asked me my view on that, Judge Hill;
4476 and perhaps I am just as much surprised as you are.

Q. Did not they ask you your view yesterday and did you not express yourself that one month would not represent a year's business or for a series of years?

A. That is what I referred to.

Q. I am referring only to what developed here and not what was said in conferences.

Is not that an inconsistent position to place their assistant general auditor on the stand to prove that one month was fairly representative of a year or a series of years, and then put you on the stand and prove that in your judgment it was not?

Col. MOORE: We object to the question, but you may answer it, Mr. Gray.

A. Your question, as I understand it is, do I not regard the railroads' action as inconsistent, in proving one thing by the assistant general auditor of the Cotton Belt and proving another thing by me.

It seems to me that the railroads could not be charged with inconsistency, because I as an operating expert entertain an opinion on an important question like this, presenting a good many complexities, differing from the opinion of an accounting expert. It is not infrequent that these departments do clash as to their opinions, and not unnaturally.

Q. That is not quite the proposition, Mr. Gray.
4477 They have put forward this month's test and proved by Mr. Kimbell that that was fairly representative for a year or a series of years and then used the figures given in that test by nearly all the witnesses for the railroads to prove the situation as presented by that test.

Mr. MOORE: I think it is fair to explain, Mr. Gray, that when Mr. Kimbell testified that was a fair test, he was speaking solely of the difference in the cost of handling state and interstate business.

Judge HILL: I understand it so.

Col. MOORE: And he says in his opinion the month adopted by him would afford a fair test as to the difference in cost of handling two classes of traffic.

Judge HILL: That is true. That is exactly correct and I think I have made that clear to Mr. Gray.

Col. MOORE: You have not made it clear.

Judge HILL: I intended to.

Col. MOORE: I know you intended to but I do not think you were entirely clear.

Judge HILL: He is speaking of revenue and expense both, on a year's business.

A. I do not believe there could be such a test that would be anything more than interesting.

Mr. MOORE: You think such a test could not be made at all? Is that what you mean?

A. Yes, sir.

Judge HILL:

Q. In addition to this test on the Cotton Belt, the Iron
4478 Mountain worked up the total figures of their business for the month of October, 1907, and put that into this case as Exhibit 26; and Mr. McPherson and various other witnesses on behalf of the railroads have used the statistics as shown in that exhibit to illustrate their position in this case; in view of that fact, would not the state be justified in taking the statistics thus prepared by the railroads and introduced by the railroads and used by the railroads, as fairly representative of the conditions in that period?

Col. MOORE: I will state now that Exhibit 26 was brought about at the request of the state, at a conference held in Judge Trieber's chambers at Little Rock. I do not recall now to just what extent Mr. McPherson or any other witness introduced by the railroads has used it; but they have not used it to any such extent or for the purpose of the exhibits to which your attention was called yesterday.

Previous question read.

Judge HILL:

Q. Would not the state be justified in using those figures to illustrate its position as to conditions in that six months' period?

Col. MOORE: That Exhibit makes no effort to separate as between local and through trains.

A. I know what Exhibit 26 is.

As I understand it, Exhibit 26 is Exhibit I of the state: is not that a fact?

Col. MOORE: No, sir, Exhibit I is based on one column of Exhibit 26.

4479 A. Without attempting to comment upon what use the railroads have made of this data for the month of October, 1907, I still believe it is unreliable and undependable to apply its results to a six months' period.

Q. That is indicating your views, Mr. Gray?

A. That is what I supposed you were asking for.

Q. I asked you if in your opinion the state would not be justified

in using that which the railroads had selected, the month of October, as the period which would make up a full statement, and after the railroads had introduced it in evidence and after the railroad witnesses had used those statistics to illustrate their views as to the situation in those six months. Then would it not be fair for the state's accountants to use it for a similar purpose?

Col. MOORE: It is not fair to state only half of the facts.

The exhibit was called for in the manner I have indicated, by the accountants in this case, and the figures at that time—and if I am incorrect Mr. Johnson may correct me—it happened that the figures for that month had been already worked up. They wanted them for three months and we refused to furnish it for three months.

Mr. JOHNSON: That statement Exhibit 26 was worked up by the railroads in anticipation of a request to be made by Haskins & Sells, and for that purpose only.

I think that has been explained two or three times.

4480 Judge HILL:

Q. You took it as typical?

Mr. JOHNSON: We took it for one month, because we could not work up any more and we took October because it was the largest business of that period.

Judge HILL: You took it as a typical month?

Mr. JOHNSON: We took it as representing the largest movement of freight.

I want to say that the freight in that exhibit is not freight handled on the trains. It is made up by the auditor from the auditor's accounts. The only purpose that that statement was used for by our witnesses was to show the relative proportion of the trans-state, state and interstate freight carried into the accounts.

Judge HILL: And the length of the haul?

Mr. JOHNSON: And the length of haul.

Mr. HILL: State and interstate?

Mr. JOHNSON: Of each class.

Mr. HILL: Now, Mr. Johnson, you selected that month of October to work up these statistics, did you not?

Mr. JOHNSON: Yes, sir.

Judge HILL: And when the state asked you for a three months' statement you said you were not willing to work that up, but you had the figures for one month already worked up, which you were willing to give them?

Mr. JOHNSON: I said in Judge Trieber's office that we had those figures worked up in anticipation of their request, which we would give them and preferred to give them that, rather than check up figures which they might make.

4481 Judge HILL: You were asked at that time whether that one month was fairly representative of the six months' period?

Mr. JOHNSON: I said it was so far as volume of business and the revenue was concerned.

Judge HILL: Didn't you say it was fairly representative of the six months?

Mr. JOHNSON: So far as volume of business handled and the revenue.

Judge HILL:

Q. Mr. Gray, my question is, after this statement was put in evidence and after it was compiled by the railroads in the way you have heard stated, and after the railroad witnesses used that statement for various purposes, to illustrate their position in regard to the statistics, contained therein, was not the state justified in using that exhibit as a basis to illustrate those same conditions?

Col. MOORE: That is objected to because that is calling on the witness to make a statement about a matter which should be determined by the court and should be determined only by the court and not by the witness.

Judge HILL: I think the witness has passed upon questions similar to that, in answer to your questions yesterday and I think I am entitled to ask his opinion about it.

A. My answer to that would be that if a month's statistical data has been testified to by the competent officials of that company as being a representative month and safe to apply to a period of
4482 six months, the state would be justified in assuming that for the basis for that six months.

Col. MOORE:

Q. You mean for the purpose for which it is being used here by the state? If the railroad accountant represented it was a proper basis for the use that has been made of it here.

A. I meant to say, if that had been testified to by the competent officials of the railroad, which would include the accounting and include the operating officials, as being one which was safe to use for a basis for six months' business, then the state would be justified in so using it.

Q. You mean if they testified it was safe for the purposes for which they used it?

A. Yes, sir.

Q. And not safe for other purposes?

A. I mean it is reasonable for them to think it was safe to use it for the purposes for which they used it.

Q. Suppose the railroad officials testified that would be properly representative of six months for one purpose, and the accountants for the state used it for another and different purpose.

A. My answer must be considered as meaning that there should have been (to be of value) unanimity of opinion among the competent officers of that company, that that was a safe month to use as illustrative of an entire period.

Q. For the purpose for which the Exhibit you criticize was used, for ascertaining the relative amount of tonnage carried by local and through trains in the month of October, 1907?

4483 A. Yes, sir, that is right.

I want to add this to that answer: that the amount of tonnage carried on local and through trains is not the only deduction which the state made from these October statistics and that my criticism extended to all of that in the same proportion.

Q. You spoke of congestion yesterday, and its effect:

A congested condition of traffic would cost you more to earn a dollar than it would cost you to earn a dollar in a normal condition of traffic, would it not?

A. That is true as respects a certain proportion of the expenses.

Q. That is the next question I want to ask you: where would the additional expense represented in the congested condition appear—in what accounts would that appear?

A. Aside from the traffic and general office expenses, they would appear in all of the operating accounts.

Q. They would not appear in Maintenance of Way, would they?

A. Yes, sir.

Q. You think they would appear everywhere except where?

A. In conducting transportation, traffic; and in the general office expenses.

Q. I think we are probably using a little different terms here. In these exhibits "Conducting Transportation" is a pretty broad term.

A. I was using Interstate Commerce Commission classification.

4484 Q. What did you intend to include in "Conducting Transportation"?

A. Conducting transportation is divided into two parts by the Interstate Commerce Commission classification "Conducting Transportation Traffic" and "Conducting Transportation, operation".

I don't remember just how you show it, but I think you call it "Traffic expenses".

My idea is that that expense is affected only in an infinitesimal way as to the general office expense.

Q. "All other expenses"?

A. Are affected more or less.

Q. You should find reflected in the expense account for everything else, except those two classes, additional expenses?

A. Yes, sir.

Q. Due to congested condition of traffic, I mean?

A. Yes, sir.

Q. You spoke yesterday of October, 1907, being a congested period: I will ask you how long that congestion lasted; when did it begin and how long did it last?

A. My best recollection of that is that the congestion increased in volume during the summer months reached its flood in the month of October, 1907, and had almost assumed a normal condition as to the handling of traffic by the middle of January, 1908.

Q. When did it begin?

A. It commenced in the early part of 1907.

4485 Q. Then practically all of the latter half of 1907, there was a congested condition of traffic, was there not?

A. Varying in degree.

Q. But it was what you would classify as congestion, all of it?

A. Yes, sir.

Q. It would be an abnormal period, taking the last half of 1907, of railroad operation?

A. That is true. It is an abnormal period, the last half of 1907, in railroad operation.

Q. The expenses would be heavier to earn a given amount of money during that period than during the normal period?

A. That does not follow.

It does not always follow that the expenses to earn a given amount of money are greater under those conditions. Quite frequently, and my recollection is that in this instance, they were less.

The expenses in gross were unreasonably swollen by that. But the density itself increasing the gross does not necessarily mean that the operating expenses increased in a greater ratio.

Q. I was not asking for the ratio?

A. Your question was if it did not cost more to earn a given amount of money?

Q. Yes.

A. That does not necessarily follow.

Q. I suppose you mean by that, in a congested period
4486 the density of traffic would tend to reduce what would otherwise be greater expense?

A. Yes, sir, that is what I mean.

Q. But still the proposition remains, as I understand your previous answer, that it would cost more during a congested period of traffic to earn a dollar than it would cost during a normal period?

A. No, sir, that is not true.

Q. That is the way I understood you a few moments ago. I suppose I failed to correctly understand you.

A. If the notes show I made that statement it is incorrect, because I did not intend to make that statement.

My position is, that a congestion will have the effect of changing physical conditions as they normally obtain, and it will have the effect of increasing the expenses in gross.

But it does not follow and it is not my experience that it will cost more to earn a given amount of money in a period of congestion than it will in normal conditions.

In fact, my experience has been the reverse; that the ratio of expense of gross earnings would be less under this condition. But the normal operation conditions are distorted during its continuance.

Q. I understood you to say that all the expense accounts would be greater except "traffic" and "general" during a congested period?

A. In gross?

Q. Yes. The gross expenses would be heavier.

4487 A. Yes, sir.

Q. But you think the compensating density of traffic in a congested period would equalize those extra expenses?

A. Yes, sir.

Q. You would say for the last six months of 1907, that even if they were congested they would fairly represent the business of the road for a series of years?

A. No, sir, I would not agree to that.

Q. What is your view on that subject?

A. I would say they do not, either for the period before or since, and practically since.

Q. They would not be fairly representative months, by representative I mean representing the business?

A. A representative month, I understood your question to be.

Q. No, I was speaking of the six months.

A. I would not regard them as being representative enough to apply to a period of years either before or since.

Q. That is the way I understood you. That answer is directed to the six months' period, and the last six months of 1907?

A. But that they are more dependable in the ratio that they bear to the one month period.

Q. You think the six months would more nearly represent the six years, than one month would represent the six months?

A. No, sir, than one month would represent the six years.

Q. Oh, yes: six months would come nearer representing
4488 six years than one month would represent six years?

A. Yes, sir, or that one month would represent six months.

Q. That is, last half of the year would come nearer representing the six years than one month would represent the six months?

A. In the approach it makes to representing the entire year's operation.

Q. But neither of them you regard as dependable factors?

A. I would regard them as persuasive.

Q. But not dependable?

A. Not as a positive basis.

Q. When did you say normal conditions were resumed following the congestion in 1907: about the first of the next year?

A. Something about the first of the year, the congestion was relieved, the cessation of business activities began in October.

Q. What would you say of March, 1908: would that be a normal month?

A. No, sir.

Q. It would be a lighter month?

A. March, 1908, would not be even a representative month for March, and March is ordinarily a light month with the Southwestern roads.

Q. It would be unusually light? Its error would be on the side of being too thin rather than too thick, as October, 1907,
4489 would be?

A. That would be my recollection of that month.

Q. October, 1907, and March, 1908, then, would represent the two extremes?

Q. Yes, sir, with the further qualification that in March, 1908, every railroad was exercising the pruning knife until the operating

results in that month were not at all representative even of its business. They were trying to economize not only for that month but looking backward.

Q. Would you probably then find the most economical operation that could be found, in that month—railroads running on a cheaper basis?

A. Yes, sir, you would find that ought to reflect, if there were no arbitraries taken in for previous months' operation—economical operation.

Q. Taking up now the accounts you discussed yesterday, the first one is "Maintenance of way": I want to call your attention to the principle upon which the accountant worked in that case.

I do not know that I can turn right to it in the record but I will try to state it.

In attempting to get a factor or unit with which to apportion the expense of maintenance of way they sought to get a factor which would represent the use to which maintenance of way was put. It was not represented as car miles or any other factor would measure actual conditions, but they should take a factor which would
4490 most nearly measure the use for which these expenses were incurred.

I will ask you if that principle is not sound. I am not asking you whether they have properly applied it, but I am asking you as to the principle?

A. No, sir, I do not think it is sound. Because it assumes to divide 100% of an expense in usage when fully 75% of that expense is not affected by that usage.

Q. I understand that. I think the witnesses on behalf of the state put that element as high as 90% as not affected by usage but they still contended that the way was for the use of trains and the use of cars, and the same factor which would represent the use should be the factor with which to apportion the expense, notwithstanding even as high as 90% of it was due to wind and weather conditions.

Don't you think that is a sound principle. Whether they applied it correctly or not I will discuss with you later. I want now to discuss just the general proposition.

A. No, sir, I cannot agree that that is even a sound principle as applied in an effort to divide expense as between these two classes of traffic.

Q. Take a business concern: suppose a man had a factory and manufactured two or three different kinds of articles in that factory? And his roof would get leaky and he would have to put on a new roof and he wanted to apportion the expense of that new roof into his cost properly applied to the various branches of his business. No one of those different kinds of business he was
4491 conducting there had caused his roof to leak or rot away; would it not be proper for him to apportion that expense by a factor which would represent the use to which that roof was put, or that building was put?

A. No, sir, I don't think so.

Q. You do not recognize that as an accounting proposition?

A. No, sir. My application of that being that if a man in manufacturing business was manufacturing coats and trousers and vests and hats and shoes, he would never in the world attempt to apply repairs on his roof to shoes and trousers, but he would, if he attempted any division, in ordinary practice he would do it upon the money involved in the transactions. Granting he had been required to divide that between shoes and trousers.

Q. Money would be one factor but would not that in itself represent the use to which that building was put.

I am not discussing with you now the different factors. I will take that up later. I want now to get at the principle.

Isn't it a right principle to take the same factor which in the judgment of the particular individuals most nearly represents the use to which that property is put?

A. Not of necessity use. The value is as fair.

We have to assume in this case we are required to do an unnatural thing, and what is the fairest way to do it.

4492 We conceive for a moment that this manufacturer who manufactures these different articles, and that the use made of that building in making a pair of shoes which have a value of $2.00 was three times as much as a coat which had the value of $12.00, it certainly would not be right to charge a greater proportion of the repairs of this roof to the shoes, of a gross value of two dollars, as against the coat, of a gross value of twelve dollars. And yet one has really used the roof more than the other and longer.

Q. That is just indicative of your method of apportioning it?

A. No, sir, it is only in criticism of this method.

Q. I am asking you for the principle.

Would you take the gross earnings or net earnings, if you were going to take any factor,—using the factory as an illustration?

A. Following out this factory illustration, I would use the gross value of those articles.

Q. Suppose you had stored all your shoes in the building, for six months, because the market had gone against you, and you had not sold any and you did not have any gross earnings: then what would you do?

A. That would be "Hang-over," wouldn't it? Of course there are different kinds of hangovers, but I would say that would be affected a good deal by the time that roof was repaired. It would be a question of judgment. But the fact would not be changed, this being a factory and not a warehouse.

4493 Q. As I take it, the only difference between us is the question of what would be the proper factor: you recognize the fact that there would have to be some factor taken there to account for this 75, 80 or 90 per cent that was due to weather or natural conditions, and which did not represent the use of the property. Would it not be proper to use some factor, and you may differ about what that factor is, which would represent the whole of that expense and not merely the 15, 20 or 25 per cent that was represented by the use?

A. Yes, sir, I say some factor should be used which would reach the entire amount of this expense.

Q. That is the point I was trying to make.

What factor should be used on the place is a matter "the doctors would disagree about," is it not?

A. Yes, sir.

Q. Is not the car mile a known factor used among railroads for the use of joint tracks, for maintenance of way expenses?

A. I have had experience with contracts where that was used and other contracts where the train mile was used. Neither one is satisfactory.

But there is this fundamental difference: that each of the trains of the parties to these contracts are entities in themselves, and no necessity arises for dividing those trains or those cars.

It is a custom but it is not a basis that we feel brings
4494 about an entirely fair approximation of this division of expenses?

Q. But it is in common use?

A. Yes, sir.

Q. The car mile in some instances and in others the train mile is the common measure for dividing the expenses between the railroads themselves?

A. That is right.

Q. Are you familiar with the litigation which took place here in St. Louis between the Wabash and the Rock Island Railroads?

A. Pardon me a moment.

I wish to say also that I have knowledge of the expenses where the car is used.

Q. The number of cars?

A. Yes, sir, the number of cars. In that case, the car using the track for five miles would count just as much as the car using it for 100 miles. All these bases are in use.

Q. Are you familiar with the litigation in the suburbs of St. Louis between the Wabash and the Rock Island Railroads?

A. I only know there was a long drawn out litigation there.

Q. Do you know Mr. S. T. Emerson, a civil engineer of 36 years experience and chief engineer of the St. Louis Kansas City and Colorado Railroad?

A. No, sir, I never heard of him.

Q. He testified about that as follows——

Col. MOORE: What is that, Mr. Hill?

4495 Judge HILL: The testimony of Mr. Emerson.

Col. MOORE: We object to the introduction of his testimony in this case.

Judge HILL: This was introduced in the testimony of Mr. Byars and I want to get Mr. Gray's opinion about it.

Col. MOORE: I objected to it then and I object now to the introduction of testimony of someone in another case being read in evidence in this case.

Judge HILL: Mr. Emerson testified as follows:

"Q. I want to state to you a hypothetical case; suppose that one railroad has a right under a contract to use the track of anoher rail-

road for a fair and equitable compensation, between certain points, can you tell me what would be a proper basis to arrive at such fair and equitable compensation.

A. Well, I should think it ought to be arrived at in proportion to the use."

Would you agree to that?

A. No, sir.

Q. Then he further explains that, perhaps I had better make it fuller before I ask you the question. He said:

"A. I mean on the proportionate number of cars run over the road by the different railroads using it. Take the total of cars used on it and get the percentage."

A. I want to say I do not agree to that. I contend that it is absolutely a matter of barter. The desire of the applicant to use this track, the abilities of the landlord railroad to accommodate them, absolutely determine that.

And it is not the question of what is right in that matter—if that is the question.

4496 If the question is at to practice, all of the three systems which I have stated to you are in practice, within my experience.

Q. Mr. Van Dyne said the wheelage basis was the one ordinarily selected for the purpose. Do you agree with him about that?

A. There is a great difference as to what the wheelage basis is.

Q. They used it in this case as synonymous with the car basis.

A. You readily understand that is not true.

Q. That has been explained by witnesses: that they originally took the wheels and counted them, car mile.

Isn't that correct?

A. I imagine tha tthe wheeleage has commonly become an expression for car miles.

Q. That is what Mr. Hillman testified.

A. But it really did not have its origin in that.

Q. Mr. Hillman testified it originated in the actual counting of wheels.

A. Yes, actual counting of wheels.

Q. But in modern parlance it was used as synonymous with car miles?

A. I want to make myself clear as to the division of expenses between railroads:

If I am managing a railroad and I am approached by another railroad for trackage rights, my ability to take care of that
4497 other railroad is the first consideration I have. Whether or not I have to spend additional money to take care of that is the controlling consideration. Whether I want them at all. Whether I am advancing their interests to the detriment of the railroad I represent is another consideration. In its last analysis the matter of barter as to what terms I will grant them.

Q. You knew Colonel Talmage—whether you knew him personally or not you knew of him?

A. I knew him personally.

Q. He was a well known railroad operating man of many years ago?

A. Yes, sir, many years ago.

Q. He testified in that case as follows:

"Q. What are the usual arrangements where one road uses a portion of a track of another, as to the basis of compensation?

A. It is generally based on a rental based on valuation of the property, and for repairs of track and other necessary expenses connected with the operation, it is on the basis of wheelage which represents the percentage that the tenant line bears to the other, represents the percentage that it bears to the total number of cars passed over the line."

I rather take it your views would agree with that?

A. My views differ from that to the extent that while that basis is usual, it is determined entirely by the value of the service to the applicant and the ability of the landlord to accommodate him.

Q. The question of value of rental would usually take
4498 care of the track features of it, and then the wheelage basis would take care of the actual expenses: that would be the idea the railroads would meet upon on that proposition, wouldn't it?

A. No, sir, not necessarily. It all harks back to the necessities of the one and the humanity of the other.

Q. Let me give you an illustration in this case that is in evidence here:

The Iron Mountain rents a track from the Cotton Belt road; it pays it so much rental I presume by agreement as to what was fair for rental, and then divides the expense of maintenance of way on a car mile basis.

Mr. MOORE: Let me see if that is correct.

Judge HILL: Mr. Kimbell testified to that. That is the present arrangement; they formerly had a different one.

Q. That is correct, is it not, Mr. Kimbell?

Mr. KIMBELL: Yes, sir, that is correct.

Judge HILL: I will ask you, Mr. Gray, in view of the fact that these two railroads after having agreed upon compensation after it comes down to the question of expense have agreed upon the car mile as the proper unit for dividing that expense of maintenance of way, if that does not present a fair unit so far as those two roads are concerned at least, to use that unit for maintenance of way expenses?

A. No, sir, it does not, because it is a basis and is used perhaps in the majority of cases; but when it comes to an analytical
4499 application it is subject to all the criticism that the car mile and the engine mile have, and that is, that they are so varying in quantity as to be valueless as a basis of comparison.

Q. Did you include in that the train mile as valueless too?

A. Valueless for purposes of comparison, yes, sir.

Q. Or division?

A. That depends whether the train mile used in that division is analagous or not.

Q. Take passenger and freight?

A. I think it is perhaps fair as between passenger and freight on account of the fact that while one really subjects the right of way to much greater use, it does not require the same degree of maintenance, that is, the high degree of maintenance, and they come more nearly compensating.

Q. Apply that to a single track road where both classes of traffic are using them constantly, would your answer hold good to that kind of a situation, as using the train mile as between freight and passenger, when both freight and passenger are using the same track?

A. Yes, sir, it does, because it means that while perhaps one uses it harder on account of the greater number of vehicles and perhaps a greater axle load, the other requires a higher degree of refinement.

Q. It seems that the principle we are seeking here you agree to, you take a factor that would measure the use and you have
4500 something that would fairly approximate a proper result. Is not that true?

A. I don't believe I understand that question.

Previous question read to the witness.

I mean by that I take it your preceding answers indicate that the train mile would be the proper factor to measure the use of the roadway and being a proper measure of the use it would approximately bring correct results in the division of expenses.

A. That would be as between freight and passenger.

Q. That is what I am asking you.

A. Yes, sir, I think for the reasons I have stated that would not be unfair but it would not be satisfactory.

Q. Would it be nearly enough satisfactory to work out the basis for division between state and interstate business?

A. No, sir, because in the one case the trains are entities and are representative of themselves. And in the other case not even the carriages themselves are representative.

Q. You understand the claim in this case, as in all of them, is that there is a certain percentage of extra cost for freight business and a certain percentage of extra cost which runs in the passenger business, for state than for interstate business.

If you were to work out a division of expenses between state and interstate it would be necessary, of course, to separate the freight and passenger in order to work out the extra cost, would it
4501 not?

A. Yes, sir, it ought to be done.

Q. Now, what do you say to this method of doing it, using the train mile for dividing maintenance of way as between passenger and freight?

A. It presents the least objection as I see it, and is about the only method I can see where the relation between two branches of service have anything in common.

Q. That is a question of how obnoxious it is.

A. It is violent, but to my mind presents the only basis where

the two departments come nearest to each other; that is, in the train mile.

Q. But that would not properly represent the relation between freight and passenger when you are seeking to divide the expense between state and interstate, as I understand your testimony?

A. That is my view.

If you will pardon me, Judge Hill, I want to be clearly understood whether or not this is competent you will have to decide:

The criticism about maintenance of way and structures expense being divided upon a car mile basis, is that it does not take into consideration the use of these facilities by business which has no compensating car miles.

Q. That is the empties?

A. No, sir, that is the switching. It is the handling of a main line for loading and unloading materials and all of the other
4502 things that ultimately find their way into miscellaneous earnings.

But yet, they have all used this property and the physical conditions here do not reflect that they have made use of car miles.

(Witness refers to Defendant's exhibit.)

Q. In speaking of that yesterday you stated there was only one factor more unreliable than the car mile and that was the train mile—as I remember your testimony?

A. Yes, sir.

Q. Just what application were you giving to those factors in that statement?

A. I do not remember at what particular place that was stated.

Q. It appears on page 703 you say:

"Then they have taken all of the freight car and caboose miles, plus 2½ engine miles, to arrive at the total of each local and through.

Then a percentage of each has been taken to divide the maintenance of way expenses as between local and through trains. I believe there is in railroad practice only one more unreliable factor than a car mile and that is a train mile."

I believe that gives you the connection.

I would like you to explain just what application you were making of that?

A. I mean there is only one factor in railroad practice that presents a greater degree of variety than the car mile and that is the train mile; in that the train mile will run all the way from
4503 one car to sixty; and the car mile will run from 15 tons to 120 tons.

Q. I understand that. But the point I am getting at, is the application. Were you making that remark apply to the division of maintenance of way expenses?

I understood your principle but I did not understand the application.

A. I was meaning on the maintenance of way and structures expense, and expected my application to be made on that.

Q. That is what I wanted to understand. For Maintenance of way and structures you would consider the train mile a more unreliable factor than the car mile?

A. As between the two classes of traffic handled on that train, yes.

Q. That is, local and through?

A. Yes.

Q. Now, that would apply of course in particular—say you had a 50 car freight train as against a three coach passenger train, wouldn't it?

A. Not with the same degree of reasoning. I have tried to explain the distinction between the two classes of service.

Q. I do not care about any repetition of it, but I just wanted to call your attention to that phase of it.

Take up the next item, "Maintenance of Equipment." You object to the use of the car mile for a division of expenses of maintenance of equipment. You said something about it probably
4504 not being so objectionable when you divided maintenance of equipment between states as between local and through trains. I did not quite catch your idea about that. I wish you would explain it a little more fully.

A. There is this fundamental distinction in dividing expenses between states; on the one hand, dividing expenses between intra-state traffic and interstate and trans-state traffic handled on one train or in one car, on the other hand. That is, that these trains from one state into another or running in one state or in the other, have a degree of comparative relation to each other, which does not obtain where you are required to divide expenses of traffic where it is all handled on one train, even in one car.

In other words, my thought is that it could be properly used in one case as having a fair and just comparison to each other, where it could not be used in the other case.

Q. Could it be used where the division between states was some eight or nine states, and you segregate the maintenance of equipment to one state out of the nine, say, or the other eight states; and then use a sum which is found by segregation, as a fair element of expense representing that given state, for that account.

A. Assuming that I would be compelled to do that, I would say on the basis of the locomotive mileage would be the nearest approach to a reasonable division.

Q. Take some eight or nine states, would not there be a good deal of difference in repair accounts of those different states?

4505 A. Yes, sir, but in the business being either directly located it——

Q. I will take up that question subsequently. You are assuming it cannot be directly located. I am not asking you that.

I am going to call your attention to that phase a little later.

But take it just as a broad proposition, is it a fair way (and by fair I mean an accurate way) in arriving at the cost of maintenance of freight cars, for instance, to take the car mileage in one state as against nine states and subtract that car mileage from the other and use that as a factor in dividing the expense?

A. Yes, sir, I think that is the only method there is.

Q. That car mileage, of course, would be made up of the running of local and through trains, just the same?

A. Yes, sir.

Q. And you think that would be a fair way of dividing the account of maintenance of equipment between nine states?

A. Yes, sir, I do not see what difference it would make.

Q. I do not find it here in the testimony at this moment, but Mr. Rosing who was the head of the Mechanical Department, I believe, for the Iron Mountain road, testified that these items could be accurately located by going through the shops; that you could accurately locate the maintenance of equipment?

A. As between states?

4506 Q. No, not as between states, but actually.

Col. MOORE: Mr. Rosing was talking about starting and stopping expense. You had better turn to his testimony.

Judge HILL: I cannot find it at this moment. But he said you could find the cost for each class of equipment separately by going through the time books in the various shops and that that would be the only accurate way.

Take coaches for instance, take express cars and the mail cars, that that would be the only accurate method for arriving at it: Do you think that is correct?

A. Yes, sir, I believe it is possible to determine, after having made certain—and even in that you would have to make arbitrary considerations.

Col. MOORE: He means as between class of equipment and not as between states.

A. I understand. It can be done, but even in that you must make arbitrary allowances for expenses which are absolutely unlocatable.

Q. Suppose all of the freight cars, for instance, in the Missouri Pacific System reaching into nine states, are repaired at various shops at Baring Cross in Arkansas, Sedalia, Missouri, Hoisington, Kansas, and other points throughout their system; and that the entire cost of repairing freight cars is lumped, taken in the aggregate, and then divided between Arkansas and the eight other states, on a mileage basis.

A. What kind of mileage?

4507 Q. Car mileage. Would you say that would be a correct way in which to ascertain the cost of repairing freight cars charged up to Arkansas, in an effort to separate state and interstate business?

A. Let me understand that. There is a "pool" made of all the freight car repair expenses.

Q. Yes, all of the Missouri Pacific System including the Iron Mountain. It is a "pool" of the Iron Mountain with the Missouri Pacific?

A. Yes, sir, it is a pool of the Missouri Pacific and Iron Mountain.

Q. In nine states I believe the evidence shows?

A. And what proportion the freight car mileage in Arkansas bore to the freight car miles of the entire system is charged to Arkansas?

Q. Yes.

A. I would say that is fair.

Q. You would say that is fair in an effort to get at the division of state and interstate business in Arkansas?

A. Yes.

Q. If that is fair, isn't it fair then to take the car miles between local and through freight trains in Arkansas, to ascertain the relative cost betwen local and through trains?

A. No, sir, I do not think the two cases have any basis of similarity.

Q. I wish you would explain why it would not have any similarity?

4508 A. The business as between states, they use the cars in just the same way. There is no distinction as between classes of traffic. When you get down to a question of dividing between intrastate and interstate and trans-state then you do, because you have the same car handling the three, and if it were a fair basis you would have no information as to the tonnage in each car.

You would get to a point now in this thing, where there is a distinction as to the amount of freight loaded in the car.

Q. Why have you not that distinction to start with?

A. Because it is not brought about by any local conditions. I am trying to make myself clear on that. I do not know that I am bringing out my thought clearly.

But the one crosses an imaginary line. There is no change in the use to which it is put, until you come to the time you segregate that between freight which is purely intrastate and freight that is purely through or trans-state.

Q. No, it is between local and through trains is the question I asked you about, not between state and interstate.

My question is this: If it is fair to get a total sum chargeable to Arkansas by taking the car mileage of those freight cars in Arkansas, made upon local and through trains alike, as a factor to separate the Arkansas proportion from the proportion of the nine states, then is it not fair to take that same factor, the car mileage,

4509 and divide the expenses between local and through freight trains in Arkansas?

A. No, sir, no more than it would have been fair to divide it between local and through all over the entire territory.

Q. But they have done that, Mr. Gray.

A. No, sir. You have used all the car mileage which has been made by the local in the other states, where the local reasonably bears the same proportion to the through; and in the state of Arkansas where the local bears a certain proportion to the through. Then if you come to divide that between local and through in the state of Arkansas, you come right up against the average haul, and that makes the distinction.

You have not asked me, in other words, to pass upon the division between local and through in all of these states. You asked me

about Arkansas, which presents similar problems to the other eight states.

Q. Is it not a fact that they are unable to find the class of trains in which a damage occurs. For instance, here is a freight car damaged and when that goes into the Sedalia shop they do not know whether that was injured in a local or a through train?

A. No, sir.

Q. They would not know whether it was done in Arkansas in Missouri or in Colorado?

A. That is right.

Q. That is the object of the "pool" is it not?

A. Yes, sir.

4510 Q. The object of the pool is to throw all of these items together, because they are indistinguishable so far as the railroad is concerned, are they not?

A. Only we know in practice, if you reduce that in all states, to through and the local, the proportion of local is going to be greater than through.

Q. Your proposition just resolves itself into this: there is more damage to the car in the local than in the through train?

A. Yes, sir.

Q. That is what your reasoning is based on?

A. Yes, sir.

Q. If this pool is made up of cars damaged in the local trains all through the nine states and is also made up of all the cars damaged in the local train, and that represents the aggregate of all that damage—if it is fair to divide that into 1/9 I fail to see wherein it is not fair to divide it between the trains that caused it?

A. I am not making myself clear, perhaps, but my judgment is that the two conditions which you state are not analagous. The division between states all of which contain the local mileage and the through mileage, and applying that same principle as between local and through in one state, is not an analagous proposition.

Q. Why not?

A. Because in one case I must assume the relations of through and local are substantially the same.

4511 Q. Is not that a violent assumption you are proceeding upon?

A. I have got to assume something; you have given me nine states.

Q. Can you fairly assume out of these nine states the Missouri Pacific System runs into that the conditions of local and through trains are the same in all those nine states?

A. My judgment is that that is relatively enough true to justify the use of that car mile basis when dividing the pooled expenses, the position I take being that there is no other equally fair method.

Q. That is not the question in the case, Mr. Gray, whether there is any other method, but we are talking about this method.

A. The value of that depends as to whether or not there is anything else that is right and proper and fair.

Q. The whole value of your opinion on this subject rests upon

the assumption that the conditions in the nine states that the Missouri Pacific System runs into, are substantially similar as between local and through trains.

A. Not of necessity.

In fairness to myself I want to state that we are confronted in this matter with a demand to divide expenses as between states and my position is that this is the only practicable way to do it—as between states. That it is not practicable to divide them accurately.

Q. If that is the only practicable way, is not that the
4512 only practicable way to divide them between the local and through trains?

A. No, sir, because it then introduces an absolutely different element.

Q. That is a question of weight?

A. No, sir, that is a question of average haul and average service that is required by the use of the local trains.

Q. All those questions of average service, average weight, and average lengths of haul have been merged into one thing in this "pool"; they have been totally disregarded after this sum is made up?

A. As between state, yes, sir.

Q. And yet you subtract one part of that on a car mileage basis and say it would not do to resubdivide it again between local and through?

A. Yes, sir.

Q. Don't you think that is illogical, Mr. Gray.

A. No, sir, I do not.

Q. You know Mr. Rosing, don't you?

A. I know who Mr. Rosing is.

Q. I have forgotten his title?

A. He is the Mechanical Engineer of the Iron Mountain & Missouri Pacific Railway.

Q. You would regard him as competent to speak on this question, would you not?

A. Which question?

4513 Q. What we are discussing, the division of expenses between states and between local and through?

A. I would not regard him as having had experience that would particularly qualify him in that respect.

Q. The railroads put him on as an expert and I suppose he was. I dealt with him as such.

A. I believe he can testify absolutely with regard to repairs and with regard to everything that is connected with mechanical conditions.

Q. He is a shopman?

A. Yes, sir. I do not believe Mr. Rosing would claim he has had any experience tending to fit him to pass on a division of expenses between local and through.

Q. You should read his testimony.

A. Unless he has qualified other than as a mechanical engineer.

Q. Let me read you Mr. Rosing's testimony on this point, which you and I have just been discussing:

"You found for a period of six months that $800,000 is the gross sum—instead of calling it a lump sum I will call it a gross sum—that has been spent for the expense of repairing these three kinds of cars".

They were at that time speaking of mail express and coach).

"Now, you are called upon to divide that gross sum between one division, being one-eighth of the whole, do you divide it upon a car mileage basis? Ignore the fact that the coaches have been more expensive or the mail car more expensive than the express car. You throw it altogether and divide it upon a car mileage basis?

4514 A. I think that would be approximately correct, correct enough for the purpose but not for actual purposes. For actual results you must take each car and what it costs.

Q. For example, say that one hundred thousand dollars is the expense accruing to Arkansas, or that has accrued within that given period. Now, suppose you want to divide that between these three different kinds of traffic operating in the state of Arkansas: you would not apportion that upon the car mile basis, then?

A. I would not apportion it upon a car mile basis at any time I have said that several times. I say, for different parts of the road, the car mile or the train mile might be as near as you can get to it. But that is not going into individual costs. You are dealing with trains in districts, and not cars. You do not run cars in districts but you run trains in districts.

Q. You do not run these cars in Arkansas, but you run them as trains: is that the distinction"?

"A. You would compare the cars in a train, as I understand it. In districts you are comparing the trains with trains, made up of equipment cars.

Q. That is your definition. I am not assuming it and I do not think these statistics have assumed it in this case at any time. I think you have injected that into your case although your counsel is not familiar with it.

Taking our former sum of $100,000 and we wish to divide between coaches, mail and express cars, having reached that $100,000 on a car mile basis, how are you going to divide it between the three classes of service?

A. By the classification of the cars and I think arbitrarily the other would be done the same way.

Q. In other words, is not this a fact: if you use the actual figures in one case you should use them in the other?

A. I should say so.

Q. If you use the unit which is a relatively correct unit, in one case, you would have to use it in the other, wouldn't you?

A. Yes, sir."

4515 I have read you fully so you can see the full text of Mr. Rosing's opinion on that. You use the actual figures if you can get them and if these are not obtainable to divide between states, then you could use the car miles to divide as between those three diffrent kinds of coaches.

Do you agree to that?

A. Do I understand your question to be that you want to divide between three different kinds of coaches. You have been asking me about freight cars?

Q. I illustrated the same point with him there with three kinds of coaches?

A. I want to know if you are asking that question having previously determined the expense of repairs of those three kinds of cars?

Q. No, they were all lumped. We have shown that the passenger equipment was lumped, just like the freight was lumped. The proposition is the same but it happened in asking you the question I illustrated with the freight equipment.

A. Your question is, having divided it between the states on the car mile basis, ought not the car mile basis be used in determining it as between the different kinds of coaches?

Q. That is the proposition on the passenger side; and between local and through on the freight side of it.

A. I would say that the latter assumption is not correct.

Q. In other words, you do not agree with Mr. Rosing
4516 on that subject?

A. I do not know, really, what Mr. Rosing's position was. But I do say it is not proper to use the car mileage basis to arrive at the cost of repairs to coaches, express and mail cars.

Q. Do you know Mr. Frank Ward, the General Manager of the Burlington Railroad?

A. Yes, sir.

Q. Do you regard him as a competent railroad operating man?

A. Yes, sir.

Q. He is a man of about your age and your experience, I take it, is he not?

A. I should say just about.

Q. I want to read you what Mr. Ward said on this subject.

"Q. Suppose you had a road that ran in two states and your cost of equipment was divided between those two states on the basis of the car mile, what would you say as to that—or say six or seven states. No matter how many states your system runs into. How many states does the Burlington System run into?

A. I think it is 12.

Q. If you had a rate case in one of those twelve states would you divide your cost of equipment between that twelfth state with the other eleven states on the basis of the car mile?

A. I don't think I would.

If I were undertaking to determine what it costs me to do business in that state I would have to make a careful local examination of what the conditions were; and if they justified apportioning more
than a pro rate proportion of the expense to that state, I would
4517 so apportion it.

Q. That would be comparing the condition in that state with the condition in the other eleven states?

A. Yes, sir.

Q. It might be that to one state that would be unfair, that is, too little, and very much too much for another state?

A. It might be.

Q. Owing to the conditions of the business?

A. Yes, sir.

That was one point and he was examined by Colonel Moore about that. I will give you this testimony in full on that, so you can see what it was.

He was further asked by Colonel Moore as follows:

"Q. One of the grounds upon which you predicate your objection to the division of expenses on a car mile basis, within the state, between the different classes of cars, is the different conditions?

A. You are speaking of passenger service?

Q. Yes. The different conditions which exist in regard to the cars themselves and the difference in the expense of maintaining the different classes of cars.

A. Yes, sir.

Q. In speaking of the division of cost of car equipment between the states, on a system which covers more than one state, you also stated that would not be a desirable way to divide it; but there is one thing to which I wish to call attention:

We will take the case in hand: The Iron Mountain operates in Arkansas, in Missouri and Oklahoma; there are three states in which it operates: in each one of those states there are through and there are local trains. The probabilities are that the general conditions which would vary as between the cars used in
4518 the state locally, would as between those three states constituting a part of this system, be generally about the same. That is to say, they run local trains in Missouri, and they do in Arkansas, and they do in Oklahoma; and probably the same variations exist in each one of those states. I think that would naturally be the case.

Isn't that difference of condition such as would preclude a division between the different kinds of cars within the state, isn't it decreased very largely when you come to divide the cost on a system running in different states, growing out of the fact that the general conditions, etc., would be about the same in the different states—you have my idea?

A. Yes, I think so. I think I agree with you fully on the proposition."

"Judge HILL:

Q. What is the proposition you are agreeing to, Mr. Ward?

A. My understanding is, that on a system of railroad which operates in a number of states, in those states there are varying conditions, such as through trains and local trains; and different costs of handling business on those through and on those local trains; and that in those different states those conditions are relatively about the same. And for a system undertaking to determine the cost of maintaining its equipment (as between the state-) it would be fair

to make the assumption that as between one state and another the conditions would be about alike. Is that the proposition?

Col. MOORE: That is the proposition I asked you about.

A. That is the way I understand it.

Judge HILL:

Q. Why would that justify it on a car mileage division between states any more than between through and local trains?

A. It would be simply a comparison of one state with another, for the purpose of maintaining the company's own records. That is the general proposition.

Q. You mean for the purposes of comparison of operation in one state and operation in another state, as to the question of efficiency in the management of the road: isn't that it?

4519 A. Yes, sir, and a little more than that.

For instance, on the Burlington road if we were going to undertake to determine whether it costs more to handle passengers in Iowa than in Nebraska, the conditions as to through trains and local trains, branch line trains and main line trains, would average up one state with the other pretty well; so it might be safe to say it costs no more and no less to handle passengers in Iowa than in Nebraska.

Q. That would depend upon whether the conditions in Iowa and Nebraska were the same, would it not, Mr. Ward?

A. Yes, sir.

Q. So your whole proposition would resolve itself into the question of whether the conditions in one state fairly represent conditions in all the states into which the system runs?

A. Yes, sir, and also upon the idea that as between states in the same general territory those conditions are approximately the same.

Q. Do you know in how many states the Missouri Pacific System runs?

A. I know about where the system runs. I know generally.

Q. It runs through ten, eleven or twelve states? Isn't that right, Mr. Johnson?

Mr. JOHNSON: It runs in nine states.

Judge HILL:

Q. Wouldn't you say that the conditions in those nine states are similar, so you could use the car mile as a basis to find out the proper expense in any one of those given states?

A. No, sir, not in all. There is a good deal of difference."

Now, I have given you fully Mr. Ward's views about that, so you would have the benefit of the entire text of it.

Mr. MOORE: Read on further there, Judge Hill. Continue from what you have read to the bottom of that page.

Judge HILL: Very well, I will do so.

4520 "By Col. MOORE:

Q. Any division as between states would be diminished when you

come to divide between states, on account of that greater similarity in conditions, that you spoke of?

A. Yes, sir, there would be a closer similarity between state and state, probably, than between local and through business in the limits of one state."

A. My thought is expressed in that last answer there.

Q. You woul say as between nine states you would agree with Mr. Ward that it would not do to separate it between nine states as fairly representative but that if that was done it would be less objectionable than separating it between local and through in the one state: that is the way I understood Mr. Ward.

A. That would be my view, yes.

Previous question read to the witness.

A. I want to explain that answer. The conditions are shown to be here that these expenses were all lumped or pooled and in being required to divide that as between states, the car mile basis has been used.

My judgment is that the car mile basis in a case of this kind, while it presents objection (as do all arbitrary sub-divisions) it does not present them in the same degree or to any such degree as the further attempt to divide the expenses attributable to any one state for car repairs between through and local on a car mileage basis, because there now enters into the equation a distinction as between short and the long haul.

4521 Q. This expense that you have heretofore in your testimony pointed out as being burdens to the bulk of trains, the short haul business, the extra terminal switching of local trains, all of those expenses have gone into and been amalgamated with less expensive repairs to cars on through trains; and yet you think after that has been done you can separate it between nine states with a fair degree of accuracy?

A. Between nine states?

Q. Yes.

A. I think with a reasonable degree of accuracy.

Q. What do you mean by that?

A. I mean by that it is more reasonable than could be accomplished by any other method with which I am familiar.

Q. You do not claim when it comes to using that factor to prove mathematically the fact, that it would be accurate, do you?

A. No, sir.

Q. In fact, you know it would not, do you not?

A. I know that. My only position throughout that has been that it is the most equitable and accurate method that I know.

Q. On page 714 I notice that Mr. Moore put this question to you:

"Q. In that connection, before you proceed, perhaps it is as well I should call your attention to the fact that in a later exhibit filed by the state, after this one, they have excluded trans-state tons from this division, and the division now rests upon intrastate and interstate, excluding trans-state tons."

4522 Now, I want to call your attention to the evidence in this case wherein this supplemental exhibit was filed:

"Q. Mr. Wharton, Mr. Moore questioned you as he did other witnesses, as to the justice of charging the trans-state freight with terminal expense:

You have given your reasons why you thought it was right, I will not go into that again, but I will ask you if you made a calculation showing the difference in cost if you would charge it as his questions indicated it should be, that is, not to allow any station handling for trans-state business.

A. Yes, sir."

Then this question was asked about the handling of the trans-state cars:

"Then the question was asked about the terminal handling of trans-state cars: have you made an exhibit showing the difference it would be if you would conceive the point and reduce that 25%?"

A. If we would conceive the point and reduce it 25%.

Q. Yes.

A. Why would he do that?

Q. I read this testimony just to show you the fact as to how Mr. Wharton put in these exhibits; that if the contentions made by the railroads were correct, it would make no difference in the ultimate decision in this case.

Were you aware that that was the ground upon which he put in these exhibits?

A. No, sir. I have not any idea what were the origin of these exhibits.

4523 Q. Was that quite a fair criticism for you to assume that it was an abandonment of his position?

A. No, sir, my answer was responsive to Judge Moore's question.

Q. I know that is true, but is it not rather unfairly critiicising them for doing something which they have not done?

A. That is not impossible. But any criticism I made was in response to the question put to me.

Q. I concede that. But with the question and answer I have submitted to you presenting the matter, is that not rather an unfair criticism in view of the reasons I have read to you as to why the exhibit was put in?

What do you say to that, Mr. Gray?

Mr. MOORE: I do not recall or understand that I ever made any suggestion to the state's accountants as to the basis upon which divisions or allowances should any of them be made. Nor do I recall that the question ever arose between any accountant and myself.

The inclusion of the trans-state freight is one of the objections indicated by my cross-examination, and as to the reduction of 25% of the cars in through trains in connection with the yard and terminal expenses, I do not think that has originated with me. I never thought of it until it appeared in this case.

A. My answer is, that regardless of where the suggestion origi-

nated, it has not added anything to the soundness of that deduction to meet an objection, by entirely eliminating a large portion
4524 of the traffic which undoubtedly should bear a fair proportion of the expense.

Mr. HILL:

Q. I want to call your attention to the testimony in this case in this connection.

It was testified to by many of the witnesses for the railroads, that cotton had three handlings in Arkansas. You, of course, are familiar with the way cotton is handled, and that cotton is all interstate traffic.

It was testified that a very large proportion of the grain traffic, which is one of the largest commodities handled in Arkansas, has three handlings in the state.

It was also testified that a great deal of the lumber that took the rough material rate and was shipped out of the state, had three terminal handlings in the state.

It was also in the testimony that the business from Memphis was treated in these exhibits as Arkansas business and that all of the business from Memphis which in these exhibits would be interstate business had two terminal handlings, one in Memphis, with which Arkansas is charged the same as if it were handled in the state.

There is also evidence that on account of the way tracks run into Fort Smith all the Little Rock business in and out of Fort Smith is treated as interstate and has two terminal handlings, in the state.

It is also in evidence that a good deal of the trans-state business was broken up and delayed two or three days in the state.
4525 In view of all this evidence the accountants for the state thought it was fair to charge interstate with one handling and intra state with two handlings. And that is the basis upon which that calculation was made.

In criticising this exhibit did you take into consideration these factors that made unusually numerous handlings for interstate business into consideration?

A. Yes, sir. My experience being that the class of traffic which requires additional handling is usually provided for at a higher rate, which compensates for such work.

I also took into consideration the conditions which you mention, say at Fort Smith, in regard to being so situated that practically everythin gis interstate. That is not an uncommon occurrence.

Q. Mr. Gray, I believe you are answering a different point than the one I am asking about.

I am referring to this station handling and as I understood your answer it was referring to the broad proposition of extra expense. I am referring now just to these expenses of handling at stations being divided on the basis of charging one handling to interstate and two handlings to intrastate.

My question is, if in view of the facts I have detailed to you and

which are in evidence, would not that remove in part at least, the criticism you made of that division of station expenses?

A. No, sir. Whatever unusual element the accountant
4526 may have used in including or excluding, does not affect the criticism I made in this matter of the method of dividing station expenses, because they may have been more fair to the state contention in including the Memphis tons in the state tons. It might have been a class of traffic that had a longer average haul than the state traffic ordinarily had. Or, on the other hand, they might not.

The difficulty about all these things is, in the absence of specific information it is impossible to testify on it. But I believe that none of the criticisms I made of this method of dividing station expenses are changed either one way or the other by any of the facts you have stated.

Q. Mr. Doddridge testified at page 96:

"I will ask you if you have given further study and thought to the terminal expense in the freight traffic as well as the passenger traffic?

A. Yes, sir. I have come to the conclusion that the proper method of ascertaining the correct terminal expense as to the freight would be substantially the same as that of the passenger.

Q. That is your judgment as to the best and fairest way of apportioning the terminal expense in freight traffics; that is, it would be substituting merely a ton for a passenger, in making your estimates?

A. No, it does not substitute a ton for a passenger."

A little earlier at page 91 he testified as follows:

"Q. What method have you got, that got at that terminal expense, if you cannot take this method?

A. I find among my memorandums a method that we designed for that purpose, or formula. I did not give it in my reasons, because the information necessary, upon which to predicate it, is absent, but I will read the example; it is self-explanatory:
4527 Take the St. Louis Southwestern Railroad, for the year ending June 30, 1908; they carry 928,313 state passengers; double this number to compensate for two station handlings. The number then indicates 92% of the total passengers handled."

And he works that out in detail, and then he takes the position that with other passengers you would double the state charge, one for interstate; and the same thing for freight, by substituting the ton for the passenger: what do you think of that?

A. It does not appeal to me.

Q. You see that the state's accountants have rather followed Mr. Doddridge in that, do you not?

A. I think they have started with Mr. Doddridge, but whether they have stayed with him or not—I think the value of the opinion of any expert would be his entire opinion and not as you follow

him on one item. Because he has made up his mind on each item in its relation to the other.

In other words, you cannot depart from his opinion on A, B and C and take it on D, and then leave him again on E and F.

Q. Suppose they are separate propositions; one is sound and the other not sound: take for example some of your statements here and some of Mr. Doddridge. If they are separate propositions and not dependent one upon the other, and if it were found he was sound on this proposition and you were sound on that proposition, if they were not interdependent propositions, should not you take those bases that are sound?

A. I don't think that could be done. It may be.

4528 Q. Certainly it could not be done if one were dependent upon the other. I agree with you upon that. But assume they are not?

A. I do not believe it is possible to use varying elements in determining a theory for this purpose. The theory throughout has got to be consistent with itself, and you either go through with it or disagree with and adopt another theory which you can apply to the whole conclusion.

4529 Q. Mr. Gray, I believe when we left off you were stating that in your opinion it was not proper to take different factors with which to divide the various classes of expenses; that such might work out correctly, but in your opinion it would not:

I believe that was about the substance of your statement, was it not?

A. Yes, sir.

Q. It seems that that is the point on which you and the witnesses on behalf of the state have differed chiefly.

I will state that it is in evidence here from a good many witnesses introduced by the state, that that is a more accurate method of doing so—to take the factor which in the best judgment obtainable most nearly approximates a given quantity that is sought to be divided, and in that way you can more nearly approximate the actual conditions than you can by adopting a common factor:

Assuming that to be the position of the state, then they are not subject to criticism for swapping bases, if in their judgment when they are doing so, they are endeavoring in each instance to get a basis more clearly applicable to the particular matter?

A. The purport of that question, Judge Hill, is as to whether I believe the state in endeavoring to be fair, is fair. Is it

4530 not that?

Q. No, that is not the purport of it. The purport of that, as I gather it, is the main difference in your views on this subject and the views of some state witnesses that have taken the position that you can more nearly approximate the actual condition by taking in each case the factor that most nearly represents it, and you disagree with that position?

A. Yes, sir.

Q. And I say, that notwithstanding your disagreement and your difference of opinion with them on that subject, they are not open

to the charge of inconsistency when they change from one basis to another, if they are doing so in an effort to get nearer the proper factor for that particular basis?

A. I have never used the term "inconsistency" as applicable to the State's witnesses or to the State's experts who devised this theory. I have used it with respect only to the theory itself.

Q. I understand that. But then there would not be any inconsistency in the theory itself, from their viewpoint, if they changed from one basis—in one instance, from car miles to tons handled, if the tons handled was nearer an approximation than a car mile, would there?

A. As between the car miles and the ton miles?

Q. I say, tons handled.

A. The only distinction is that one is worse than the other. I don't believe there is any element of expense there by
4531 which, taking the physical characteristics alone, it can be subdivided, at the same time taking care of the costs, equitably, as between all earnings.

Q. You still do not catch the idea.

A. I don't mean to side-step.

Q. I understand that. You have used very frequently the statement that this or that is "inconsistent:" I understand you mean by that inconsistent with itself.

Now, if they are right— that they should change a basis as they change each particular item to get the factor that is more nearly an approximation of the actual results of that particular factor, it is not inconsistent for them to adopt it, although you may disagree with them as to the factor used?

A. It is not an inconsistency for them to do it, but that does not change my view.

Q. I understand. I am not asking you to change your view about it, but I am just asking you if it is not proper for them, having those views, to change those bases as often as the varying conditions would require them to do it?

A. I don't believe I do understand just what it is that you want me to cover in that answer: whether they are consistent in applying these various bases because they believe that they can be applied?

Q. That is my question.

A. Then I would say they are not inconsistent.

4532 Q. You differ with them, as I understand it, as to the proper application as to these bases, and you made your views on that subject very clear, but I want the viewpoint from the other standpoint.

Col. MOORE: May I ask a question?

Judge HILL: Certainly.

Col. MOORE:

Q. What I understand you to mean is this: you regard the change of factors, in your view, as an inconsistency in the exhibits, but

you would not say that the party who made the exhibits was conscious of acting inconsistently in making that change of factor——

A. That is the way in which I endeavored to state that proposition.

Col. MOORE: That is what I thought.

Judge HILL:

Q. One of the matters that you referred to in that connection was "Traffic expenses:" you pointed out an inconsistency in dividing that on a gross earning basis: I want to state to you the substance of the testimony in regard to that:

I think every witness for the state (certainly those who were employed as experts) testified they did not think the revenue was the proper factor to divide traffic expenses, but that they knew of no physical factor like car mile or train mile, or any of these others—even the ton mile—that was proper, and in the absence of having a factor which they could prove, they merely accepted the railroad division on that subject. In the absence of anything else
4533 and to avoid discussion on that subject, they just accepted that as a division, and it was also shown here by some of their exhibits that if they had taken the ton mile or car mile it would work out more favorably to the state.

So in view of that fact, they are not subject to criticism for merely accepting the railroad's division on that point, with that explanation, are they?

Col. MOORE: It seems to me that is not a matter for the witness to determine. That is a matter to be determined by the court. That is just Mr. Gray's opinion as to the good or bad faith of these witnesses.

Judge HILL: Oh, no. He was criticising that, I assume, without the knowledge of their explanations as to why they did so.

Col. MOORE: Mr. Wharton said some of these factors they did not use as proper ones——

Judge HILL: That is one of them. I am illustrating that very point; that he stated about the traffic expenses that he merely accepted the railroad's division on that.

A. I would say that would perhaps modify any view I might have entertained as to the inconsistency of the one who planned and prepared it, but not with regard to the inconsistency of the proposition itself.

Q. I understand that. But when matters are prepared in that way it puts a different face on them than the way they were
4534 put to you in your direct examination, does it not?

A. I don't believe I conceive an opinion of inconsistency on the part of the people who prepared this. I only approach it in criticism from the standpoint of one who has dealt with these things practically every day for years.

Q. Speaking of that item of "traffic expenses" while we are upon it, is that a proper charge, to any considerable extent, against the intrastate traffic?

A. From my viewpoint I want to say it is difficult to determine in traffic expenses what part is really attributable to competitive conditions and what part is merely attributable, and a benefit to all the public alike, to the extent of having conveniently located traffic offices.

The element of stable rates has largely eliminated competition, and I believe under those circumstances—especially as these traffic expenses include all of the general freight office and their tariff issues, that the earnings basis is not unfair.

Q. I believe you said that you do think that it would be some considerable portion of some proper basis, that should be ascribed to intrastate?

A. I think the state ought to stand an equitable proportion of this traffic expense.

Q. That was the only point that I was seeking to bring out.

I want to call your attention to the testimony of Mr. Ward
4535 on that subject (page 686), where he says:

"It seems to me the point is a very small one. I would not personally think very much of the expense should be charged to the intrastate business."

You would differ with him on that, would you not?

A. Yes; my theory is that the state should stand an equitable proportion of that expense.

Q. On this question of starting and stopping and those other physical questions that you were asked about yesterday: are you familiar with this book of Mr. Wellington's?

A. No, I am not.

Q. It is in evidence here that it is used as a text book in an engineering school and that he was accepted as a standard authority.

It is true that this table to which reference has been made, has been carried forward from the earlier edition and the edition from which it was copied in this case was 1908, containing this table, and the table was based on the results of tests made on the Pennsylvania Railroad, so the book says, and that is all in evidence.

Subsequently there was a test made—or rather a compilation made—from working conditions extending over a series of three years, I think it is, on the Union Pacific, by Mr. Berry (then chief engineer) and he gave the result of those examinations in 1904 in which he disagreed only one per cent with Mr. Wellington, using Wellington's classifications but putting different percentages as he found it worked out on the Union Pacific:

4536 In view of that would you not consider (whether you agreed with him or not) that those were good authorities to act upon?

Col. MOORE: I disagree with counsel as to what Mr. Berry did. I don't think the exhibit made here of Mr. Berry's formula of division in the report referred to, indicates that he did more than to use a formula in the Wellington book, without any indication as to what his own views may have been. I called attention to that at the time the exhibit was made. It is not quite fresh in my mind now and I will not undertake to state it more closely.

Judge HILL: I may be mistaken, but I am asking him from that viewpoint. It is all in the record.

A. I would not undertake to pass on either test unless I knew how it was made; what methods were used in arriving, particularly, at the damage done in stopping and starting at way stations. Candidly, I would not give much consideration to this matter. The only thing that would prompt me to do that would be the regard I have for Mr. Berry.

Q. You know Mr. Berry?

A. I know him intimately, but if Mr. Berry has stated and it is in evidence how he arrived at these figures, and there were no arbitrary assumptions, they would have a good deal of weight. But if Mr. Berry agrees with Mr. Wellington in the proportion that
4537 is stated here as being Mr. Wellington's deduction, I believe that they are both manifestly wrong.

Q. If it is in evidence that Mr. Berry used Mr. Wellington's classifications, but that he worked up the percentages (among others, on this starting and stopping proposition) from actual investigation for a series of years, on the Union Pacific road, if that is a fact you will give great weight to it?

A. If that is a fact and it was a practical test over a series of years on the Union Pacific road, subscribed to by Mr. Berry, it would have a great deal of weight.

Q. That is the point I want to make. Whether Mr. Moore or I am right in our construction of Mr. Berry's statement, is a matter for the court.

Mr. Rosing testified on that subject: he would be in a position to testify very intelligently on it, would he not?

A. This is on the question of the relative cost of stopping and starting and damage done at terminals?

Q. Yes.

A. I don't know whether Mr. Rosing's experience has been such that he——

Q. His observation would be in the shops; he would not know how it occurred on the road: is that your point?

A. I don't know what Mr. Rosing's experience has been.

Q. He gives it here and as I recall it it has been in the mechanical department in the shops, all the time. I am not certain, but that is my recollection: is that not correct?

4538 Col. MOORE: I think he said he occupied several positions.

Judge HILL: He says here he has been employed in all branches of the machinery department.

A. A man could be that and be almost entirely without road experience, so I would not for a moment discredit anything he says as being based upon his experience.

Q. I understand that. It is just a question of whether he has formed a correct opinion based on his experience. I myself am not questioning the absolute honesty and sincerity of his testimony, but doctors differ, you know.

What was the proportion you put on that yesterday?

A. I believe that of the damage which results in repairs, not less than sixty per cent of it has its origin in those two causes.

Q. Sixty per cent?

A. Yes, sir.

Q. How did you divide that sixty per cent?

A. Two-thirds of that, or forty per cent, is due to terminal handling.

Q. Mr. Rosing (as I find it) put 32% on starting and stopping and 28% on terminal: that just about reverses your proportions, does it not?

A. It does not exactly reverse it, but my judgment is that twice the damages done in terminals is done in starting and stopping at stations.

Q. You know Mr. Whitenton, of the Rock Island, I suppose?

4539 A. Yes, sir.

Q. He is a man of large operating experience, is he not?

A. Yes, he has had a good deal of experience.

Q. Road experience you mean, not in the shops?

A. No, not at all.

Q. He says (page 493, printed volume 2):

"In fact, I believe that somewhere about 70% of our total damage to equipment is done in the switching of cars."

That is still different, is it not?

A. Is that just terminal switching or switching for——

Q. I will read the entire paragraph. He is summarizing the extra cost proposition and this is in the ninth paragraph of that summary:

"The increased damage to equipment: the increased switching and handling of cars in the local business, in my opinion, has a very decided tendency to damage the equipment. In fact, I believe that somewhere about 70% of our total damage to equipment is done in the switching of cars. That is based simply on my observation and experience in trying to run down the elements that go to make up the cost of repairs to equipment, and which create the conditions which make repairs necessary."

That is his complete statement on that subject.

A. His term "switching" there is inclusive of a good part of the cost that I have used. For instance, my twenty per cent (which covers starting and stopping at stations) is bound to include the switching at stations and does not include switching at terminals.

I think you will find that Mr. Whitenton and I are not so far apart when you include both figures, which practically means that.

4540 Q. Do you think Mr. Whitenton is including his starting and stopping in this?

A. When he talks about switching and——

Q. I do not see anything to draw that conclusion from.

A. I have included the switching necessarily, at local station in my stopping and starting, because my other forty per cent is term. al

only. I should say that we are not very far off on it. He may be a little bit high and I may be a little bit low.

Q. You are using different terms, though, and it seems to reach the same result, as you construe his testimony?

A. Not widely different.

Q. This illustrates the point I was making, that doctors do disagree sometimes.

Col. MOORE: I do not think they disagree very much here, Judge.

Judge HILL:

Q. Now, Mr. Gray, turn to this passenger proposition: as I understand you, you thought it was a change of bases, or an inconsistency, as you may term it, for the State's accountants not to attempt a division on passenger traffic, between local and through trains: is that correct?

A. I think I commented more on the fact that another method has been used and the local and through trains now eliminated.

Q. What do you consider in railroads in this section of the country, to be the division between the number of trains, local
4541 and through, in passenger? About how many through trains are there and about how many local trains, in proportion to each other?

A. That is such a variable——

Q. This is the point I want to get at: as I recall your testimony in the Missouri case you stated it was usually about one-half of each—the proportion of the local and through to each other:

That, roughly speaking, you would consider to be about the situation, would you not?

A. Yes, as applicable to the lines that I know.

Q. And you gave your testimony on this subject with such a division in mind, did you not?

A. That influenced my thought.

Q. That is what I would have supposed.

Now, I want to call your attention to the actual conditions on the Iron Mountain in that respect. This is an exhibit put in by the railroads, by Mr. McPherson, giving the classification and list of all the passenger trains run on the Iron Mountain system in Arkansas: there are eight through trains and forty-eight local, according to his classification, and of those through trains one of them was a fast mail that goes south from St. Louis to Texarkana and carries one sleeper: that is the only passenger traffic it does:

That is a different situation of affairs from what you would ordinarily have in mind when you consider that problem, is it not? Is not this situation different from what you would expect to find?

4542 A. It is not different from what our situation was in Missouri at that time. The train mileage of forty-eight and the train mileage of eight would of necessity have to be considered, but we had at that time a fast mail, which is a duplicate of what you have in mind—which runs from St. Louis to Bonita, across the

entire length of the state of Missouri, and does not carry any passengers.

There were also factors in the Missouri case which have not yet been given to me in this case, and that is, what of this local train mileage was considered necessary by the railroads; what was brought about by any regulation of Federal or interstate authority, and what had been put on by express authority of the state. We had all those conditions in the Missouri case.

Q. In regard to that latter proposition, there is really no testimony in this case bearing on it, but I will call your attention to the physical situation of the Iron Mountain so that you will see there is very little, if any, effect given to that by reason of forced train runs.

The main line runs through the state from one end to the other and then there is a very large traffic, as you know, between Little Rock and Fort Smith; between Little Rock and the Louisiana line; the White River branch is a through line; and the one over there in eastern Arkansas—the River Level Line, is another through line division; the Memphis train, as you know, has a heavy traffic:

Calling your attention to those things, you will at once
4543 see there would be very little, if any, forced trains; no stubs, curved lines or things of that kind, like we are pretty well blessed with here in Missouri: is not that a fact?

A. Yes, or in Arkansas either, as far as we are concerned.

Q. Recognizing that situation that I have just outlined on the Iron Mountain, you see that would hardly be the effect of forced runs?

A. Is it admitted for the purposes of this case that there is no——

Q. I said there was no testimony on that, but I am just calling your attention to the physical condition of the Iron Mountain, which I suppose you are more or less familiar with. I suppose you see that if there are any forced trains on these little lines, they are very inconsiderable factors?

A. I can see in this exhibit——

Col. MOORE: You assumed a while ago that there were no regulations in Arkansas—I believe you said in evidence—in regard to the running of local trains——

Judge HILL: I don't recall any.

Col. MOORE: Mr. Johnson informs me that there are regulations, either by statute or put in force by order of the Commission, which has the effect of the statute because they are authorized to do that, and I want it understood that that is material——

Judge HILL: I don't care anything about that. I just stated in my question that if there were any he would know from the
4544 general situation that they were a comparatively small number.

Col. MOORE: I would not want Mr. Gray to make an answer upon a statement which may be incorrect, and you would not, either.

A. I don't know how much of this local mileage is brought about

by an action of the state. That has an effect upon the matter of cost to which I testified in the Missouri case.

Col. MOORE: I imagine it is about the same in both states.

A. There are a number of others which enter into the equation here that were not present in the Missouri case, and which in my opinion, affect the expense of operation of passenger service considerably.

Judge HILL:

Q. I am not asking about the operation—of the expense of it: I was just asking you of the desirability, in view of the way the trains run in Arkansas, of making a division between local and through; whether it would come as near as possible to actual results: that is my question to you.

A. I see no value in dividing it between local and through, as I have seen no value in the freight statistics, and for practically the same reason.

Q. You do not object to its being divided as between the coaches, etc., instead of being divided between the local and through trains?

A. I would not regard the coach mile basis as being any
4545 better or any worse than the primary method of dividing it between the local and through, except that in criticising the entire theory, I think it is as inconsistent to use the local and through in the passenger, and finally divide that between interstate and intrastate on a passenger mile basis, as it would be to do what is done here.

Q. Is it not considered by good operating railroad men, that a division of passenger traffic, between the coaches, mail and express, on a car mileage basis, is equitable?

A. Not within my acquaintance.

Q. Do you know Mr. Seward R. Knott?

A. No, I never had the pleasure of knowing Mr. Knott personally.

Q. You know him by reputation?

A. Yes, sir.

Q. From your knowledge of him you regard him as a competent railroad operating man, do you not?

A. No, I do not think Mr. Knott ever had any experience as such.

Q. Was he not vice-president and general manager of the Louisville & Nashville Railroad?

A. I think he was vice-president, in charge of the traffic of the Louisville & Nashville Railroad. Mr. Knott has never had any operating experience, to my knowledge.

Q. Subsequently he was president, I believe, of the Kansas City Southern?

A. He was the executive head of the Kansas City Southern.

Q. We have already put in evidence in this case state-
4546 ments from Mr. Knott, which I will not take the time to again quote in your testimony: he takes the position that the car mileage basis is a fair one when they divide the passenger traffic between mail and express: what would you say to that?

A. I would not accept it at all.

Q. Do you know Mr. S. C. Johnson, of the Cotton Belt?

A. Yes, sir.

Q. He gave testimony before the Postal Commission to the same effect, where a division of the passenger mileage was very much as it was in this case, and testified that that was a most equitable way of reaching that: you could not agree with him, either, could you?

A. On a car mileage basis?

Q. If you wish I can give you in detail just what they said about it, Mr. Gray, but that is the substance of it. It has already been introduced in evidence here.

A. No, I would not feel that that was right.

Q. I believe it is also in evidence that Mr. Peabody, of the Santa Fe, testified that that was a proper way of dividing—I think he was testifying about express; these other gentlemen were testifying about mail. You know Mr. Peabody?

Col. MOORE: He did not testify in this case.

Judge HILL: No, but his testimony was quoted in this regard.

A. Yes, I know him quite well.

Q. He is a man of large railroad experience, is he not?

4547 A. I don't know. My only acquaintance with Mr. Peabody has been as a statistical expert.

Q. He has given great study to these accounting propositions, has he not?

A. I think that is a fair statement, that he has done that.

Q. If I remember correctly, the excerpt from his testimony was taken in the hearing in regard to the express, in which he advocated the car mile division—express and mail, substantially the same proposition as is used here: I understand from your previous answer that you disagree with him?

A. Yes. I don't believe that that is a fair and equitable basis.

Q. You criticised yesterday the use of the statistics on the Cotton Belt for the fuel, using those same percentages that applied on the Iron Mountain:

I want to read you the testimony of Mr. Doddridge on that point, and I will explain further that the accountants in this case have testified that they were unable to get any statistics for the year 1907; when these statistics were put in, not having preserved them—they had no statistics to get that information from.

This question was asked Mr. Doddridge (page 106, volume 2):

"Q. Fuel, I presume, is another one of the chief items as you worked that up in the Cotton Belt case. Would the actual figures you worked up on fuel cost between local and through trains

4548 on the Cotton Belt, apply generally on the Iron Mountain?

A. I presume that those proportions would be applicable in a general sense on the Iron Mountain, or it ought to be.

Q. That is, you mean the relation in the cost between the two classes of trains?

A. They ought to be unless there is some difference in conditions on the Iron Mountain that might change the relations.

Q. Do you know any conditions between those two roads (you have been general manager of both) that would change the relation of the fuel cost between them, as to the proportion consumed on the local as against the through, or the through as against the local?

A. I do not know of any conditions that would change those relations on the main line of the Iron Mountain as compared with the Cotton Belt—the Cotton Belt Railroad is mostly main line. The Iron Mountain main line is a very similar road through Arkansas, as to grades and other things—I guess the Iron Mountain is a little better than the Cotton Belt, some parts of it—and of course the Iron Mountain has other divisions, like your road from Little Rock to Fort Smith, that used to be very different from the Cotton Belt. I guess it has been improved now.

Q. It has all been improved. You must not indicate that anything going out of Fort Smith has not been improved, or we will have a falling out.

A. In a general way the test on the Cotton Belt ought to reflect the general average conditions."

Q. In view of that testimony of a gentleman who had been general manager of both of the roads, would you not think the state could fairly accept those percentages in trying to get the general conditions, in the absence of being able to get actual figures?

A. I cannot see any inconsistency in the state assuming that, but I can see an inconsistency in an operating officer making
4549 a test upon one road in one month, and assuming that that condition could apply to another railroad, without any knowledge of the business conditions on that line for that month, and which (while he had previously been general manager) he had not been associated with for over five or six years.

Q. But he testified, Mr. Gray, that he made a close study of the statistics of those two roads before he testified in the Missouri case and in this case.

A. And yet there are no statistics which he could have studied, on the Iron Mountain, which would have given him the relative consumption of the local and through freight.

Q. You disagree with Mr. Doddridge in this statement?

A. I question the statement. While I do not disagree with it, I don't know whether it is too much or too little.

Q. Under these circumstances, where Mr. Doddridge is put forth as a leading witness for the railroads, and testified he was an adviser of counsel in the case, do you not think the state would be justified in assuming that this was a correct percentage to use?

A. Did the state assume everything else that Mr. Doddridge said to be true, applicable to the Iron Mountain?

Q. I don't know that any other question was raised that I can answer you.

Col. MOORE: He said a good many things applicable to the Iron Mountain that we do not think you will agree with.

4550 Judge HILL: But as to any physical matter like this, I do not recall anything else that he stated that there has been any disagreement with. There may have been, but as far as I can recall right now there were not.

A. Without a knowledge of all of the facts which Mr. Doddrioge may have reported with regard to the two lines, I could not take one deduction and say that it was right for the state to use that to the exclusion of others.

Q. I think I have read you all that relates to this point, Mr. Gray. If there is anything more, I do not know where it is.

A. I would have to say that I couldn't state with any consistency in that matter, while I might still entertain my respect for doubt of the efficacy of those figures.

Q. But poor, inexperienced Arkansas lawyers would be justified in taking a man of that vast operating experience as knowing what he was talking about, would they not?

A. I don't know. When these Arkansas lawyers get a man on the stand they twist him into pretty near any distorted shape, before you get through with him.

Q. Mr. Gray, we have all sorts of doctors in this case: we have Dr. Johnson, statistician of the Iron Mountain, and Dr. Kimbell, of the Cotton Belt, and under this head of "traffic expenses" I see Dr. Johnson uses the gross revenue in dividing between states.

Mr. Kimbell uses the revenue train mileage as the factor:

4551 with which one of those doctors would you agree?

A. I would agree with Dr. Johnson.

Q. You would take the train mileage?

A. No, sir.

Q. The revenue train mileage?

A. No; I understood you to say he took the gross earnings.

A. Yes, Dr. Johnson takes the gross earnings; that is right, and Dr. Kimbell takes the revenue train mileage.

A. I will agree with Dr. Johnson in that particular.

Q. In "Station expenses" Mr. Johnson makes a division between freight and passenger, of combined station expense, on an approximately revenue basis: that is the way it is stated, I believe:

Is not that switching from one basis to another when he takes the "traffic expenses" on gross revenue and then takes "station expenses" on approximately revenue basis?

A. I would have to have the whole proposition before I can answer on that. I never knew any basis by which you divided "station expenses" alone. I don't know of any basis upon which you divide station expenses alone.

Q. Here is his exhibit:

"Station service includes the wages of station employés, station supplies and expenses and telegraph and telephone expense. This expense is practically all local and is charged to the state in which the expense is incurred. Wages of employés at and expenses of stations handling both freight and passenger business are divided 75% freight and 25% passenger, which is approximately the proportion of revenue for each class of business."

4552 What do you think of that?

A. From my observation and judgment, I would say that to divide those unlocated station expenses between freight and passenger on a basis of seventy-five and twenty-five, is about in line with equity, even if it did not closely approximate the earnings.

Q. How are you going to reconcile that basis with dividing "maintenance of way and structures"——

Col. MOORE: That is gross earnings equalized?

A. It happens to be.

Q. And the per cents of seventy-five and twenty-five are not accidental, but are used for the purpose of equalizing—as being the proper basis of equalizing?

Judge HILL:

Q. How are you going to reconcile that with dividing "maintenance of way and structures"——

Col. MOORE: Will you let me have this question repeated?

Judge HILL: Certainly.

(Last question of Col. Moore read.)

Mr. JOHNSON: It is a monthly occurrence; it has to be done every month. The percentage is 26 one month, 24 or 25, and in order to make a uniform percentage we accepted the average, which was 25 and 75.

Judge HILL: I am not objecting to that. I am calling attention to the different basis——

Col. MOORE: I object to comments being made on it without proper information.

4553 A. I understand that is not a different basis from what he has used; that he has located in the state, to begin with, all the expenses that are locatable.

Judge HILL:

Q. And then taken this 25 and 75 as approximately the revenue, I presume?

Col. MOORE: No——

The WITNESS: He says it is the revenue.

Judge HILL: It is an average of the revenue, I presume, or something of that kind. I do not care anything about that. There is a different basis injected into this.

Col. MOORE: If you want Mr. Gray to pass on the method adopted in that exhibit, I would rather you would either read it to him or let him read it than to state your construction of it.

Judge HILL: Very well. You take this copy, Mr. Gray, and I will keep the other.

Q. Now, take the first page, Mr. Gray: you see that is divided between freight and passenger on yard engine mileage: is not that a fact?

A. (After examining paper.) Yes, that is true.

Q. What do you think of that basis? That is a swapping of bases, too, is it not? Do you understand that paper?

A. No, not this last part.

Q. It follows right there (indicating on exhibit) "this is the proportion of yard engine mileage in each class of service."

4554 A. I don't understand it.

Q. That is what they say. I am sure if you do not understand it, I do not.

A. I don't understand how they arrive at the proportion of yard engine mileage in each class of service, unless it was supported by the experience of some one. I have never had occasion to divide that.

Q. Suppose it was properly based on an estimate of six miles an hour: what do you think of this factor to divide that expense?

A. There has to be an arbitrary assumption in that; whether or not that assumption is correct or incorrect I couldn't say. I don't believe any six miles an hour can be divided into freight and passenger without some arbitrary.

Q. Is not this subject to the same criticism that you made of similar divisions in the state's exhibits yesterday—divisions between local and through?

Q. Yes.

A. No, sir.

Q. Did you not say that the train mileage would have no relation or bearing to it? Was it not six miles an hour? I know you objected to it.

That was in the expense of maintenance of yard locomotives, at the top of page 2, exhibit "K"; what was your criticism of that?

A. That criticism was of the fifty per cent. I said I did

4555 not know whether it was enough or too much.

Q. Did you not criticise the use of the yard mileage as six miles an hour?

A. I don't believe I criticised the six miles an hour. I don't know that that is an unfair allowance. I would not be still using it if I did think so.

Q. You were not critical of the six miles an hour?

A. I did not criticise the six miles an hour. I think I said I assumed that this was based on six miles an hour?

Q. Is not the principle of adding these arbitraries equally open to the criticism you made of the other, if that mileage was figured at six miles an hour?

A. I don't understand that this is on six miles an hour.

Q. You do not understand that it is?

A. It says the total charge is divided on 95 and 5: I have not been told how that 95 and 5 is arrived at. I have never seen any figures that would enable me to——

Q. Assume, Mr. Gray, whether it is in evidence or not, that this has been figured on that six miles an hour basis: would that be actual?

A. Oh, no.

Q. Then this division would be subject to the criticism of using an assumed proportion, would it not?

A. The difficulty about my criticising this division is that I don't know how it is arrived at.

Q. I just put it to you hypothetically—that if it were
4556 based upon the six miles, that it would have the objection that the other had, except that it has to be divided, and the logic used in arriving at the arbitrary would be the determining factor in passing upon its reasonableness?

JUDGE HILL: I think the Interstate Commerce Commission gives a direction for something of that kind authorizing the use of six miles an hour for that purpose. I am not criticising the exhibit or the item itself, but I am calling Mr. Gray's attention to the fact that it has assumptions and arbitraries in it as well as some others.

Q. Is not that true, Mr. Gray?
A. Yes, sir.
Q. Now take the "Mixed train service": have you that before you?
A. Yes, sir.
Q. You will see that is divided 75% freight and 25% passenger: is not that another arbitrary assumption?
A. I cannot agree that that is an arbitrary without knowing how it is arrived at.
Q. Suppose that is made under the same rule of the Interstate Commerce Commisison that might justify that; still it would not be actual results that they have there?
A. I don't think it is fair to ask me to say how that is arrived at. I would say that if that is an arbitrary assumption without any basis in fact, that it has to stand in that category.
4557 Q. Would not that ignore the expense of carrying passengers in cabooses of local trains?
A. Ignore the expense?
Q. Yes.
A. Yes, sir. I would like to see the mixed train mileage as contrasted with the total train mileage, because I believe that that item is immaterial, however divided, as affecting the whole.
Q. I believe you made a point yesterday on one of these sub-divisions of the state, that it had ignored or taken no account of carrying passengers in cabooses of local freight trains?
A. No, the criticism I made yesterday was the use of passenger miles in dividing the coach expenses which included passenger miles in Pullman and caboose cars, without any information as to the amount in each.
In other words, the criticism I had of that was that that divisor was not composed of common units.
Q. What do you say of this?
A. I don't know how this is arrived at.
Q. This ignores all expense of carrying passengers in local freight trains—this diviison that we are now considering.

COL. MOORE: This has nothing to do with passengers carried in local freight trains, had it? It is dividing mixed trains between freight and passenger.

4558 A. This ignores because it applies—there is nothing in this formula that puts on the passenger side of the house the expense of handling the passenger on the local freight train.

Judge HILL:

Q. Mr. Gray, turn to "General Expenses":

You see the primary division betwen states is on a gross revenue basis, and a subdivision between freight and passenger inside the the state, on a train mile basis: what do you think of that?

A. I think that that is fair, for the reason that the greatest proportion of the general expenses is in connection with the accounting, auditing and conserving of the revenue, and for the reason which I have stated before in the examination, I believe that the basis between freight and passenger being placed upon train miles, which is a complete entity in each case, is the most equitable.

Q. Is not that a swapping of bases?

A. No. Here we have used train miles for this right through this theory.

Q. I do not think you have for general expenses, anywhere else, used train miles on a division between freight and passenger.

A. They used the earnings basis here for dividing between states, and the train mile for dividing between freight and passenger. That is true throughout the other part of this formula.

Q. Mr. Kimbell, of the Cotton Belt, used the train mile all through, both between states and trains: which are you going
4559 to agree with, Dr. Johnson or Dr. Kimbell?

A. I incline to the earnings basis as between states, and the train basis as between passenger and freight, for the reasons which I have given.

Q. Then you would disapprove of the use of the train mile all the way through in that, would you?

A. No, I have approved of it as between freight and passenger.

Q. I mean, when divided between states on a train mile you disapprove of that, do you? You see, one uses the gross earnings and the other the train mile: I want to get your judgment as to which of these gentlemen have the better theory.

A. Let me have just the exact item——

(Mr. Kimbell shows same to witness.)

Q. Which do you now agree with?

A. Having been approached by Mr. Kimbell, I still agree with Mr. Johnson.

Q. Now take "Hire of Equipment": will you read that over, Mr. Gray?

A. Yes, sir.

Q. This seems to be a net figure in the difference between the amounts paid by the Iron Mountain for the use of cars of other lines, and the amounts received by it for the use of its cars by other lines:

It seems the railroads have used the same division between states, that the state used between local and through trains, the car mile: do you think that is right?

4560 A. I think that a division of that kind between states is equitable and I don't think that a division of that between local and through trains is equitable, because it does not take into

consideration the elements of difference brought about by the short and long haul.

Q. Aside from being equitable, is that an accurate division of that item?

A. I think it is, for the reason that in common practice there is no distinction whatever between a foreign and a local car mile.

Q. What relation would car mileage on the Iron Mountain tracks, in Arkansas, have with the car mileage of cars off that line?

How do you understand that question, Mr. Gray? Maybe you understand it a different way from the way I do.

A. "This account includes the amount of rentals, mileage or per diem paid for the use of equipment belonging to other companies, less the amount received from other companies for the use of our equipment."

In other words, that is a net credit or debit.

This item is divided between states upon a basis of the total mileage of each class of equipment in each state.

Q. You have taken the car mile running in Arkansas to divide that equipment expense running through the state have you not?

A. Yes, sir.

Q. That is what I thought I asked you a while ago.

4561 A. Yes, that is right, and it bears that through relation because of the fact that in common railroad practice there is very little distinction made between ownership, particularly at the time of business stress.

That debit created by such a condition is, in my opinion, correctly chargeable to the several states on the basis that they have profited, and that profit is represented in the car miles.

Q. You criticised yesterday the use of the month of October for the purpose of getting the casualties and damages occurring during that period, and stated that generally there was quite a lapse of time between the time when the damage was occasioned and the time it was actually paid: that would be true of the six months' period, too, would it not?

A. Always in less proportion on account of the inclusion of a larger period. It presents less elements of objection because of the inclusion of a larger period.

Q. But it certainly would not represent actual conditions.

A. It would not represent actual conditions.

Q. You testified yesterday that much of the trans-state business was cheaper because there was very little handling of that in the state and that it would not be charged up with station expense: was not that about the substance of it?

A. Yes, sir.

Q. It is in evidence in this case that in the month of October, 1907, 1454 trans-state cars were examined, by taking fifteen days' billing—just as they came.

4562 Those 1454 cars took an average of 6.03 days to get through the state, as against a schedule of 1.1 days; would not such a movement as that represent some station expenses in Arkansas, as well as terminal expenses?

A. That would depend upon where they rested during this interim. If they were stowed away on some abandoned mill track and stood out there until you could get to them and use them, they are not representing any material expense in station service——

Q. These were not empties.

A. I mean loaded. Take a period of congestion and cars quite often take the direction of least resistance.

Q. Would it be your judgment that 1454 cars, taking that length of time going through the state, that all of them would be stowed away some where, on some track?

A. No. But I would not feel qualified to say whether or not that would make material difference in proportion. As far as accounting is concerned it would make no difference.

Q. I am speaking of the expense of handling the business.

A. The station expense is what you are talking about.

Q. That would be using the tracks and the facilities in the state considerably, would it not?

A. What is the distance that these 1454 cars passed——

Q. They ran from 221 to 298 miles in the state. They were all trans-state.

A. What is that average per day; did you figure that out?

4563 Q. The average schedule movement was 1.1 days. The actual movement was 6.03.

A. But what is that average miles, per car per day?

Q. Mr. Hamilton says it is something like fifty miles.

A. I would say that in a period of congestion that is a fair movement.

Q. Take a movement in March, 1907: there were 1560 cars worked up: they took an average of 4.1 days to get through the state and the schedule time on those cars was 9/10 of one day, or practically one day.

A. I don't think it is fair to contrast actual with schedule. I don't believe that out of 1500 cars any railroad hopes to make schedule. You haven't told me whether this schedule was a fast freight schedule or that these cars are fast freight cars.

Q. There was a schedule applicable to these cars.

A. I did not know there was such a thing.

Q. It is the schedule which is called "ordinary schedule" as distinguished from red ball.

A. Ordinary schedule and 1.1 days for 298 miles?

Q. That is the schedule day on the 1454 cars in October; the other was practically one day schedule and the actual time was four days.

A. The one day schedule comprised how many miles?

Q. 221 to 298.

A. That is an exceedingly unusual schedule. I cannot believe that any railroad would undertake to do that.

4564 Q. It has been done.

A. I am talking about your schedule; not your performance. I don't believe any railroad has that schedule. I don't believe the Iron Mountain has it.

Q. This was taken from employés' and official time cards.

A. 298 miles in twenty-four hours——

Q. That is the average given.

A. I am talking about the average. I am not picking out one fast train.

And you have taken the lowest schedule as being a possibility, and without placing against that the actual performance?

Q. That is the way I understand it.

A. As I understand your schedule, the car has got to start running just as quickly as it is received and is not given any time after it has stopped, to arrive by your schedule?

Mr. HAMILTON: What we did was to take all the billing shown there, from and to the territory shown on those sheets.

The WITNESS: Your average, for instance, might have included one car that might have been delayed thirty days for bad order?

Mr. HAMILTON: It shows the exact time. There were 100 cars that stayed fourteen days in Arkansas. Of course one of them might have been there fifty. It is an adding together of the time
4565 cards without any terminal delay, and by the short line routes. We took certain tissue books, without knowing where they were going, to find the cars and trace them by the wheel reports. We did that so as not to call attention to——

The WITNESS: But the time it actually stood in the yard you did not consider?

Mr. HAMILTON: We made no allowance for that.

The WITNESS: And you made no allowance for that in your schedule?

Mr. HAMILTON: No, that was on the theory that they ran them into the yard, cut off a caboose and started another out, as has been testified to.

Judge HILL:

Q. Would not such a movement as that represent some use of the facilities and terminals of the railroad in Arkansas, for trans-state business?

A. It would represent some, but an absolutely indeterminable amount, as I said.

Q. What about representing terminal use?

A. It would not change my idea as to the relation, because all the freight handled there was being handled under exactly the same conditions and terms, and the officers and employés directly handling it have no opportunity to make any distinction between transstate, intrastate or interstate. They simply know it as freight.

In my opinion, the relative conditions as they obtain between those three classes of freight and as affecting the expense, would not be changed by this condition, because the men handling
4566 them, the men who create the expense, do not know the difference between them.

Q. They handle it indiscriminately?

A. Yes, sir.

Q. And that would be there for handling that length of time above the schedule?

A. Yes, and if it assumed the same proportion of the other freight which would hang up in the same way. I am just stating that as an unfortunate experience.

Q. That would be a matter of assumption on your part?

A. Yes, sir.

Q. Would not that represent the use of facilities, sidetracks, yards, etc.?

A. Yes. But it does not change, in my estimation, the relative conditions which go along with it.

Q. Whether it changes the relative condition or not, it shows——

A. Yes, that represents a use of all facilities in the state.

Q. And represents the use of station forces and terminals in the state?

A. Yes, sir.

Q. And you are assuming that the other freight would be running in the same proportion and if it was it would not change the relation?

A. That is it.

4567 HUBERT ROTH, recalled, testified as follows:

Direct examination.

By Col. MOORE:

Q. Mr. Roth, you have testified heretofore in this case?

A. I have.

Q. I believe you stated on your former examination that you were connected for a number of years with the Accounting Department of the Iron Mountain Railroad?

A. Yes, sir.

Q. Mr. Roth, you are familiar with Exhibit 26 filed on the part of the railroads and with Exhibit I filed on the part of the state, in this case?

A. Yes, sir.

Q. The first exhibit referred to covers all freight taken into the account of the Iron Mountain road for the month of October, 1907:

Have you made any investigation of the local trains that ran during October, 1907, for the purpose of ascertaining whether there was any freight hauled on those trains that was not included in the Auditor's accounts and in the statements contained in Exhibit 26 and Exhibit I?

A. Yes, sir, I made such an investigation.

4568 Q. If you have, please state what that investigation was and what it showed. First, how did you make it and what did you investigate, what trains and so on?

A. We investigated 16 trains in all, 13 of which were on the Arkansas Division; one westbound on the Memphis Division; one

northbound on the Valley Division (that is from Monroe to McGehee) and one eastbound on the Central Division.

We compared the state detailed sheets with the waybills and made corresponding sheets, in which we inserted the dates of the waybills as an index of the account that that particular freight would have gone into in auditing our accounts.

We also made a notation if it was received at a period subsequent to the month of October.

We found that all of the freight on those 16 trains, of the trans-state freight about 30.5% was not included in our October account and about 15.5% of the interstate was not included in our October account or our Exhibit 26.

Of the state freight, a fraction over 6% was not included

Q. Mr. Roth, as I understand you, those proportions you have mentioned of trans-state, interstate and state freight you found on those sixteen trains, were not included in the Auditor's accounts of freight handled in October or in the statistics on Exhibit 26, and consequently, not in totals of the state's Exhibit I which is based on the railroad's Exhibit 26?

A. That is correct.

4569 Q. You say you investigated, and analyzed I suppose, the results of sixteen trains. I believe there were 46 local trains investigated by the state. Am I correct in that, Mr. Hamilton?

Mr. HAMILTON: That depends on what you mean by "trains". If you mean all the trains running under that number, there were 46; if you mean individual trains running that month there would be about 1400.

Mr. ROTH:

A. (continued). As compared with the trains I mentioned, it would be 46.

Q. You investigated about one-third of the local trains for October?

A. Yes, sir, about one-third.

Q. Why did you not extend your investigation over the entire 46?

A. It would have taken too much time. I believe we could not have completed that under a year's work.

Q. So it was impracticable to extend it beyond the trains you did investigate?

A Yes, sir, it was.

Q. Did you have any data from which to investigate the through trains?

A. No, sir, there was nothing in the shape of data which would have enabled us to do that.

Q. Mr. Roth, if the same conditions which developed on the sixteen local trains, you investigated in regard to freight not included in the auditor's accounts, had existed on the through

4570 trains, what would have been the amount of tonnage actually handled in the month of October, omitted from the auditor's accounts and from Exhibit 26?

A. There would have been a difference of about 27 million ton miles.

Q. It would have swelled the tonnage for October about twenty-seven million tons?

A. Yes, sir.

Q. Where did you find the percentage of business not included on the trains you investigated was heavier with regard to the division or territory in which the trains operated?

A. We found it was heaviest on the trains nearest the border of the state, and not so heavy with those running central in Arkansas

Q. What effect in your judgment, would that have upon the percentage which would have developed if you had been able to analyze the entire forty-six trains?

A. I think if we had been able to analyze the forty-six trains the three percentages I have mentioned would have been considerably increased.

Q. Mr. Roth, I believe the heavy cotton movement begins with October, and that is one of the months in which there is a very heavy shipment of cotton in Arkansas?

A. It begins in October and there is a fairly heavy movement in that month.

Q. What effect does that have upon the loading of the
4571 local as compared with the through trains in that month?

A. It would necessarily increase the percentage of interstate business, as all cotton is treated as interstate business in our exhibit. It was also so treated in the state Exhibit I.

Q. How is cotton counted in the state's Exhibits in this case: are the tons of cotton handled on the trains doubled up by their method of treating it?

A. Cotton, owing to its double movement, in all statistics compiled by us, would shaw a double movement on account of the movement into the compress and the movement out.

Of course, that would not apply on ton miles as you would have those individually. But the tonnage necessarily repeats itself.

Q. It doubles itself?

A. Yes, sir. That, of course, is only in so far as cotton goes into the compress points.

Q. A good deal has been said about the handling of cotton at terminal stations: what proportion of the volume of tonnage handled on the Iron Mountain road consists of cotton?

A. The total cotton movement in the year 1909 was 1.27% of the total tonnage of the Iron Mountain road for that year. In the month of October, 1907, it was 2.58 percent.

Q. That is in the statistics of the company?

A. That is in these statistics.

Q. In those statistics does this double accounting on account of handling at the compress appear?

4572 A. Yes, sir, all cotton that goes into the compress would naturally come out again?

Q. Really, the percentage of cotton handled that way is swelled somewhat as it appears in the statistics of the company?

A. So far as the tonnage is concerned I would say it would be swelled some 60 or 70 percent.

Q. Do your estimates of 2.27 percent in 1909, and 2.58 percent in 1907, refer to the actual tonnage, the tons handled?

A Yes, sir.

Q. That would be affected by this doubling up at the compress points?

A. Yes, sir, that would be reduced somewhat, if you could eliminate the first movement.

Q. What does Exhibit 26 give as the quantity and number of tons of interstate freight carried in the month of October?

A. 291,110 tons.

Q. That is interstate, not including trans-state?

A. That excludes trans-state freight.

Q. What amount of that in tons or percent, or both ways, is cotton?

A. 7231 tons or about 2.5%

This was cotton that was loaded at Arkansas stations and billed to the compress points, only.

Q. Does not a considerable quantity of cotton in the state of Arkansas move to the compress points in other states?

4573 In other words, is there any considerable quantity of cotton that does not receive that additional handling, which grows out of the additional handling at the compress points?

A. Yes, sir.

Q. State what are the facts on that point?

A. For instance, all cotton shipped from stations north of Newport would go directly to St. Louis or to Dupo uncompressed.

There is also a movement from various stations in Arkansas south to Houston, Texas, that would go uncompressed, particularly from McCrary.

There is also a movement in southern Arkansas to Monroe, Louisiana, which is compressed there for shipment south.

I should say fully 30% of the cotton movement would not be compressed in Arkansas.

Q. And would not have that extra terminal handling that has been referred to in this case as chargeable to cotton at compress points?

A. Yes, sir.

Q. Is that an estimate or have you any figures on that?

A. I have no actual figures. It is more or less an estimate so far as this cotton movement is concerned. But I have looked into the matter.

Q. You have investigated for the purpose of forming an opinion?

4574 A. Yes, sir.

Q. But you have no statistics on that?

A. No, sir, I have no statistics.

Q. I wish you would state the proportions of grain shipped into Arkansas to the freight movement in that state?

A. The total grain movement over the Iron Mountain in the month of October, 1907 was 105,646 tons.

The grain milled in Arkansas, of interstate origin, 5513 tons or a fraction over 5% of the total grain movement or about 1.1 per cent of the total interstate tonnage as shown by our exhibit 26, which is 507,350 tons.

Of these 5513 tons, 3037 tons were reshipped to interstate points. This would constitute about 1.4 per cent of the trans-state tonnage shown by our Exhibit 26.

The other 2,476 tons were reshipped to Arkansas points and would be less than one per cent of the Arkansas interstate tonnage, as per our exhibit 26 which is 291,110 tons.

Q. Have you prepared a statement showing a comparison between the percentage of revenue accruing from the handling and hauling of the commodities and the percentage of the total tons one mile made by such commodities?

A. Yes, sir.

Q. I see you have a statement prepared which contains also in narrative, form, deductions you make from the table which constitutes the principal and important part of the statement: I will ask you to file the entire statement as a part of your testimony?

4575

A. This statement is as follows:

Comparison between the percentage of Total Revenue de-
4576 rived from the handling and hauling of Commodities and the percentage of the Total Tons One Mile made by the same Commodities.

The Comparison is made both on the Missouri Pacific and St. Louis, Iron Mountain & Southern System as a whole, and on the Intrastate freight traffic in the state of Arkansas.

The object of this comparison is to demonstrate that the Revenue derived from the handling and hauling of all classes of freight traffic bears a very much closer relationship to the cost of handling these Commodities than does the Ton One Mile.

In order to make plain the cost and the relation of Revenue and Ton One Mile, I have graded the various Commodities into six groups, according to character, loading, risk by loss and damage, handling and incidental cost.

Group No. 1.—Consists entirely of less than carload Merchandise and is of necessity the most expensive class of freight handled by the Railroad Company, as it involves very light loading, consists of many articles that are bulky, fragile or of delicate texture and of considerable value which naturally carries with it a heavy risk from loss and damage, it also involves much handling at stations and the maintenance of a large force of men for this purpose. It further necessitates a larger clerical force than carload freight as it involves the making out of waybills and bills of lading of about 100 less than carload to one of carload and increases the clerical work in the Auditor's office in the same ratio.

Group No. 2.—Represents carload Commodities, the loading of which is, on the average, light, many of which have the same characteristics as less than carload, making them liable to loss and damage and subject to extra handling. This group consists of carload merchandise, all kinds, and manufactured articles, fruit and vegetables, cotton and live stock.

4577 Group No. 3.—Represents commodities generally carried in light loads but on which the risk from loss and damage is less great and which requires no handling and consists of Hay, Packing House Products, Oil and Machinery.

Group No. 4.—Represents medium grade commodities, carried in heavy loads on which there is some risk from loss and damage and consists of Grain and Grain products, Cotton Seed and Cotton Seed Products.

Group No. 5.—Represents lower grade commodities, carried in heavy loads with little, if any risk from loss and damage and consist- of Lumber and other Forest Products, Salt, Brick, Lime and Cement.

Group No. 6.—Represents lowest grade of Commodities and the cheapest to handle, cars being loaded to full capacity, little, if any, risk from loss and damage, several cars usually moving together, some moving in train loads. This group includes Coal, Ore, Sand, Stone and Gravel, Cinders, Clay and Fertilizer.

*Statement of Freight Traffic of the Missouri Pacific and St. Louis, Iron Mountain & Southern Railway Companies as a Whole and of the St. Louis, Iron Mountain & Southern Railway Company Intrastate in Arkansas, by Commodities, Showing Tons One Mile and Revenue Earned and Percentages of Total.*

Calendar Year 1909.

| | System. | | | | Intrastate. | | | |

| No. 6 ..... | 24.38 | 16.37 | 30.25 | 14.58 |
| | 100.00 | 100.00 | 100.00 | 100.00 |

4580 The Ton Mile figures in themselves are the result of two factors only, the net weight of the shipment and the distance it is hauled, i. e. the net weight is multiplied by the number of miles it is hauled and the result is tons one mile.

The percentages of tons one mile shows on sheet 3, are the tons one mile made by the commodities in each group, compared to the total tons one mile of all freight. The percentage of Revenue shown, is the Revenue derived from the handling and hauling of the commodities in the same groups, compared to the total Revenue derived from all freight traffic.

The tons one mile take into consideration, only the two factors named, weight and distance, whereas the Revenue takes into consideration not only these two factors, but every other factor brought into play during the process of handling and hauling the freight.

These percentage figures show that the construction of rates generally State or Interstate, is based on the cost of doing this business, and that such departures as may, from time to time, be made by traffic officials for reasons testified to by them would not detract from the value of the Revenue as a basis of division of costs.

The revenue is governed entirely by the rate, based on cost, ton miles entirely by weight and distance; the heavy loading of low grade Commodities largely offsets the length of haul when compared to lightly loaded Commodities—for example, a carload of coal containing 80,000 pounds hauled 100 miles, would make the
4581 same number of ton miles, as carloads of Merchandise containing 20,000 pounds hauled 400 miles; this gives you a common factor of 4,000 ton miles to measure the cost. The shipment of coal at the Arkansas Commission's rate would earn $38.00, the shipment of Merchandise, $82.00, or over twice as much. The Arkansas Commission's Standard Distance Tariff Rate for 400 miles is the same as for 300 miles and applies equally on one Line or two line shipment.

Applying Interstate rates to the same shipments, a shipment of 80,000 pounds of coal hauled from from Jenny Lind to Wagoner, a distance of about 100 miles, would produce a revenue of $52.00 and

a shipment of Class S. Freight of 20,000 pounds moving from St. Louis, Mo., to Donaldson, Ark., a distance of 400 miles, would bring a revenue of $96.00. Again compare one carload of coal hauled 100 miles to four carloads of Merchandise hauled 100 miles. The ton mile gives you the same common factor of 4,000 ton miles for the car of coal and the four cars of Merchandise. The Revenue from the car of coal would be $38.00 and from the four cars of Merchandise $208.00, from four cars of Machinery $144.00, from two cars (each 40,000 pounds) of wheat, $80.00.

4582 Q. You stated a moment ago that all cotton at compress points is in the statistics of the company as handled twice in and out?

A. All of the cotton movement into the compress is counted twice, in and out.

Q. Is that true also of grain?

A. Of grain milled in transit.

Q. That is what I mean, at milling points.

A. Yes, sir.

Q. That also is interstate?

A. Virtually all in Arkansas. It is not all.

Q. It is practically all?

A. Yes, sir.

4583 FRED P. JOHNSON, recalled, testified as follows:

Direct examination.

By Col. MOORE:

Q. Mr. Johnson, how long have you been engaged in railroad accounting work?

A. A little over 21 years.

Q. All your business life, then, has been in the auditing department of the St. Louis, Iron Mountain & Southern Railroad Company?

A. Yes, sir.

Q. You have, consequently, I take it, given a great deal of time and attention to railroad accounting, have you not?

A. Yes, sir.

Q. You are familiar with the manner in which the accounts and statistics in the auditor's office of the Iron Mountain road are made up and kept, are you not?

A. Yes, sir.

Q. How has the data upon which the accounts of expense and maintenance in its several branches, equipment—and in fact all the ways in which it is divided between the different branches of the service and between the different classes of equipment, and in regard to which the statistics have been compiled, been obtained?

Does the Auditor work that up from his own views as to the proper basis of division or does he obtain information from the operating officials of the road to aid him in keeping accounts and statistics? State what the practice is on the Iron Mountain Road, please?

4584

A. The operating expenses of the railroad are taken from practically two sources: the payrolls and the vouchers.

In some cases the vouchers originate in the Auditor's office and in other cases they originate in the division office that incurs the expense.

The payrolls of the operating department are made up entirely in the division office from individual time books of each department.

The distribution of these expenses is made by a division accountant at the various division points.

In the Iron Mountain organization this division accountant in the maintenance of way department reports to the chief engineer of maintenance of way.

In the equipment department he reports to the superintendent of machinery.

In the transportation department the division accountant reports to the Assistant General Manager.

The accounts are made up monthly and submitted by the various superintendents to the general auditor. They are in that office checked and verified as to the total and consolidated into the system accounts.

These accounts that are rendered by the division accountants to the general auditor's office represent the charge to the ex-
4585 pense account, and since July 1, 1907, have been compiled practically under instructions contained in circulars issued by the Interstate Commerce Commission.

The compilation of these accounts and the division when necessary between freight and passenger, and the various statements in connection with the operating expenses, are made in the auditor's office.

Q. Mr. Ludham, a witness on the part of the state in this case testified that the operating man is the one least qualified to figure out his own cost, and that that is done by the accounting department.

What is your view as to the qualification of these classes of officials for the purpose of distributing the operating cost?

A. I do not know exactly what Mr. Ludlam meant by that statement. But if he means that the accounting man is more familiar with the individual items of expense, and the causes that brings that expense about; and for that reason is able to say just how it ought to be apportioned and what kind of a statement ought to be compiled in order to enable the operating official to know just what it costs on his road, then I do not agree with him.

I will say this, that ever since I can remember, in the service of the Missouri Pacific Railway we have had frequent occasions to divide the individual items of expense. For instance, there may be joint stations between two operating divisions or under the old
4586 Missouri Pacific System there may be joint stations between two corporate lines, where the employés were performing service for both companies or both operating divisions, and in order to find the cost of each division it was necessary to divide this joint expense. In that case the matter was referred either to the general

superintendent of that territory or to the two superintendents of the individual divisions, for their opinions.

Judge HILL:

Q. Mr. Johnson, you have read Mr. Ludlam's testimony, have you not?

A. Yes.

Q. Don't you recall that he states it is the duty of the accounting official to acquaint himself with the facts from the operating official, and then devise a system by which these accounts could be properly separated?

A. Yes, sir, I believe he did say so.

Mr. MOORE:

Q. Mr. Johnson, state your views as to the correctness of the opinion expressed by Mr. Ludlam?

A. The accounting official is hardly able to acquaint himself with the actual operating conditions from any particular part of his line, except by conferring with and getting information from the operating official.

Referring back to these items of station expense, the way that was handled was to refer the matter either to the general superintendent of that territory or to the superintendents interested and after an investigation by them they would either advise the auditor's office of some arbirary percentage or some unit that they felt would
4587 represent the relative use of the service at that point by the two divisions. And that recommendation was always accepted by the auditor's office.

Now, getting down to the operating costs of a railroad, most of the railroads in this part of the country had to compile a statement showing the relative cost per ton per mile and in some cases the cost per passenger mile, on different stations of their road. I have never known of any case where any road adopted such a system as that where the system itself was not practically installed by the operating official.

The Missouri Pacific road commenced compiling such a statement as that in May, 1900. It was done at the request of the general manager, and the system that was installed was installed under his instructions and brought by him from the road he was with before coming to the Missouri Pacific System. I have always understood that the formulas in use under that system were formulas which he had originated.

Judge HILL:

Q. Was that Doddridge?

A. No, sir.

This particular statement which is compiled in the auditor's office, is a statement furnished to the operating official exclusively, and any change recommended by the operating official is always adopted; and no change is ever made in that statement unless it is recommended by the operating official.

That statement is the only statement compiled in the Iron Mountain office that pretends in any way to show the cost of operation in either the freight or the passenger service. The operat-
4588 ing department in using that statement has never pretended that it represents the actual cost nor do they ever use it for that purpose. Its object is to enable the general manager or general superintendent to make a comparison of the cost of operation upon one division in one month with another.

Q. Now, Mr. Johnson, I will come to that a little later.

You are familiar of course, with Exhibit I filed by the state in this case and also with Exhibit 26, upon which Exhibit I is largely based:

Will you state what you think of the correctness of the method adopted by the state for the purpose of ascertaining the tonnage carried on local and through trains in the month of October, 1907?

A. So far as the method used by the state is concerned in ascertaining the business handled by the local train, and then deducting those figures from the total figures shown by Exhibit 26 (which was filed by the railroad) is concerned, I do not believe it is fair and I do not believe it is a system which would be used by any railroad official.

The figures compiled in Exhibit 26, representing the total business for that month, are compiled from one source.

The figures representing the movement of local trains are compiled from another source.

The figures purporting to represent the local train move-
4589 ment are not figures that are included entirely in the total figures.

I do not believe it is a fair assumption to make such deduction. That refers particularly to the tonnage figures.

Q. You think correct information as to the relative tonnage carried on these trains could be ascertained in that way?

A. I do not believe you can get a correct figure.

Q. It has been shown in this case that there is a large amount of tonnage moving the month of October, which is not included in the auditor's accounts for that month: do you believe that omission could be accounted for or made up by any system of lap-overs from month to month that might exist in the relation of the auditor's accounts to the actual movement of the freight handled.

A. I have no idea how the lap-over from month to month will run. But in order to make this statement of any service we are compelled to assume that whatever buisness moved on the locals in the month of October and did not get into our accounts, was offset exactly by the proportion of business that got into the accounts but did not move. That proportion must be exactly the same, not only in volume as to ton miles, but as to the commodities themselves.

It seems to me a violent assumption to assume that the lap-overs from September to October and October to November and November to December would be exactly the same.

In order to verify that it would mean as much labor and
4590 time upon each of those months as was spent in compiling this exhibit I. It is a work which is practically impossible.

Q. But your view is that the lap-overs would not equalize mistakes of that sort, or rather, the misleading effect of comparisons of that kind.

A. I cannot imagine how such a condition could prevail.

Q. Mr. Wilmerding, the witness on the part of the state, and who was connected with the Oklahoma Corporation Commission testified that that Commission had never been able to arrive at any satisfactory basis for dividing expenses of railroad operation, or, he said "To get the railroads to agreed to anything." That they had been working on the question since November, 1907:

I wish you would state what you know about that and if the Oklahoma Corporation Commission has made any suggestion or request upon the railroads with which you are connected, the Iron Mountain Railroad, in that regard?

A. The Oklahoma Corporation Commission, very shortly after its organization, undertook to establish a system of reports from railroads and called several meetings of railroad officials. I attended two or three of those meetings (representing the St. Louis Iron Mountain & Southern Railway) and I do not understand that the Oklahoma Corporation Commission ever attempted of their own accord to adopt a system for ascertaining the cost of state and interstate freight. But the only order the Oklahoma Corporation Commission has issued to the railroads relative to this matter. is their Order No. 201. That order was sent
4591 out to the railroads two or three different times, as tentative orders.

There were several conferences with the Commission and the substance of those conferences was that the railroads would furnish whatever information the Corporation Commission of Oklahoma asked for.

Order No. 201 (which is a standing order) is in force today, and merely provides for the items under expense accounts and revenue accounts that the Commission wants.

So far as the division of those operating expenses between freight and passenger, or between state and interstate, there is no order in force from the Corporation Commission, and the railroads are expected to make this division upon any basis that they might believe to be fair.

The Iron Mountain has been furnishing the Commission with a monthly statement, ever since its orders was in effect.

The statement undertakes to show the state freight and passenger revenue; and the state freight and passenger operating expenses.

We are furnishing that statement upon the basis used in all these rate cases, which is the revenue basis.

During my attendance at those meetings and conferences with the Commissions and with its representatives, I have never heard of any plan proposed by that Commission for such a separation of expenses and earnings.

Q. Were you in any way connected with the Missouri Rate Case, and if so, state in what way?

4592 A. I either compiled or was connected with the compilation of all of the exhibits that were furnished by the Missouri Pacific Railway in that case.

I attended all of the hearings before the Master, with the exception of one week at Chicago; and all of the hearings in the Circuit Court, with the exception of one day.

Q. Mr. Wharton testified that the testimony in the Missouri Case indicated that the main difference in the cost of state and interstate traffic was the cost of the local and the through trains:

Is that your understanding of the testimony in that case, that the main difference was in the cost of local and through trains to the exclusion of other elements of increased cost of state traffic?

A. No, sir, I think there were a number of reasons given for the extra cost of state freight, as contributing very largely to that extra cost, in addition to the local train expense.

Q. Has the Iron Mountain Railroad ever made a practice of dividing the expense of maintenance of way between local and through trains in such manner as has been adopted in this case?

A. No, sir, I do not remember of any case where the Iron Mountain has ever had occasion or ever attempted to ascertain the cost of an individual freight train, whether it be a local or a through

4593 train.

Q. What do you think of the state's method of dividing the expense of maintenance of way between local and through trains? If the separation had to be made do you believe the manner adopted by them, the car mile basis, is proper from your standpoint as an accountant and from your experience in railroad accounting?

A. I do not see that the basis adopted by the state, so far as the maintenance of way and structures is concerned, brings about any closer relation to the expense of those two classes than any other arbitrary method would be, and I have no idea how the exact expense of either local or through trains or of one individual train, could possibly be ascertained with any degree of accuracy.

Q. You have heard the testimony in this case that a large proportion of the expense of maintenance of way and structures is not due to operation, but to other causes?

A. Yes, sir.

Q. In that view do you think the method adopted by the state is a proper one?

A. No, sir, the larger the proportion of that class of expense that is due to the elements the less accurate would be any unit either of car miles or train miles, because, as has been stated by other witnesses, neither the train miles nor the car miles would have any effect upon that class of expense. It goes on regardless of the volume of business.

Q. It is more or less of an overhead expense than other-

4594 wise?

A. It seems so to me and it is more of a general expense than any other item in the operating department. It is not a regular expense. By that I mean that the expense which is incurred this month is not taken into the account this month or next month or

possibly not this year, and the traffic or the car movement has no bearing upon the amount of money which is taken into maintenance of way expense in the month in which the car movement is made.

Q. I notice in ascertaining the engine miles for the purpose of making the division under that heading, they have assumed that 270,564 engine miles and on the next sheet speaking of maintenance of locomotives under "Maintenance of Equipment" there is an enumeration of 130,150 engine miles for yard locomotives:

Is that omitted from the figures to which I first called your attention under the head of "Maintenance of Way?"

A. The item of 270,564 engine miles as shown in the state exhibit K under the heading of "Maintenance of Way and Structures" is road engine miles. While under "Maintenance of Equipment" yard locomotive mileage is shown to be 130,150.

This 130,150 miles has been omitted from the engine miles or wheels taken into account under "Maintenance of Way and Structures."

The yard engines are incurring an expense in maintenance of way, maintenance of tracks, and the use of structures to at least the same extent as the road engine mileage is; and if the wheelage basis is to be considered a reasonable basis for dividing maintenance of
4595 way and structures expense, I do not understand why the switch engine mileage should not be included in it.

Q. What effect would its omission have upon the percentage of cost under that heading?

A. It is 130,000 miles, practically 50% of the total road engine miles, and it would have a bearing upon the division to the extent that that mileage should be increased to equalize the switching car movement.

Q. Mr. Wright was examined in regard to the allowance made for road switching. He submitted his statements based upon the average number of cars set out and picked up at stations on the Iron Mountain road:

Have you looked into Mr. Wright's statements to see whether they were made upon a correct basis or not?

A. Yes, sir, I have read his testimony on that subject and secured the work sheets upon which he based his calculations.

Q. Are his calculations made upon a proper basis?

A. I do not think they are.

Q. State now what the difficulty with them is?

A. In the first place, in taking an estimate that Mr. Wright made, he arrived at the conclusion that 40% would be more nearly correct than 50%, to be added.

He took as his basis of calculation a train run from Newport to Little Rock; he estimated the number of cars set out and the number of cars picked up and assumed that the engine in local service would make two trips for each car. He then estimated the length
4596 of the passing track by multiplying the car capacity of that track, as shown on our timecards, by thirty and in that way ascertained the number of feet; or, reducing it to miles the number of miles made by that local engine in switching service.

I notice in his work sheets he allows at Bald Knob ten cars, five set out and five picked up. But for some reason allows but ten engine trips.

At Kensett he allows four cars set out and four cars picked up, making eight in all; but allows only ten engine trips.

Now, if those two items were changed, allowing two engine trips for each car, as was done in the case of every other point, the percentage would be increased to about 63%.

But there is this objection to that basis: the mileage of those passing tracks is not the car capacity multiplied by 30.

The method used by the railroads in ascertaining the car capacity, is to take the actual length of the track, allow various lengths at each end of that track for leads and then divide the balance by various figures, from 36 to 40, based upon the length of the car and the space between them. Such a method would naturally bring about a much larger mileage for that passing track.

Q. Speaking of leads, what is the allowance for that?

A. It varies, I think, from 75 to 125 feet at each end.

There is this additional objection to Mr. Wright's method,
4597 in my opinion, and that is that in making his assumption as to the amount of mileage made by switching engines, or the engine engaged in local service, he assumes that all the switching done by that engine would be done on the passing track and makes no allowance for other tracks that would be maintained at the various stations.

Q. Where is the switching usually done? On the passing track or on the other side tracks and industry tracks?

A. My understanding of the method of handling that kind of work at the local station is, that there would be no more switching done on a passing track than is absolutely necessary and the side tracks and industry tracks are maintained for that purpose.

Q. What is the purpose of maintaining a passing track?

A. The name indicates that. It is for the purpose of allowing a train to take that track for the purpose of enabling another train to pass by.

Q. The habit of switching on the passing track would probably defeat the purpose of their maintenance?

A. It would in many instances.

Q. The fact remains that the majority of switching is done on the side tracks maintained for that purpose?

A. Yes, sir, on tracks maintained for that purpose.

Q. Is the mileage of such tracks included in Mr. Wright's figures?

A. No, sir, as I understand from his exhibit and testimony it is the mileage he arrived at by multiplying the car capacity
4598 of these passing tracks by thirty.

The car capacity of the passing track is the only information of that kind that was shown upon our timecards, from which this information was taken.

Q. That is probably the way he was misled, seeing it on the timecard?

A. I do not know what his idea was.

Q. The real switching tracks, and the industrial tracks mileage do not appear on the timecard?

A. No, sir.

4599 Q. Mr. Wright also testified he made a comparison from the time table of the time allowed to #98 and #96 local trains between Texarkana and Little Rock and train #56, the red-ball train between same two points and found there was about 40% more time allowed the local train than the through train to make the same distance. He says that would tend to support his statement:

Now, Mr. Johnson, I wish you would state to what extent those schedule allowances and allotments are carried out in actual practice and what is the value of Mr. Wright's deduction there?

A. I do not believe it is fair to make any assumption of the amount of switching that might be done by an engine on a local train, by comparing the time card mileage of one class of train with the time card mileage of another class.

In looking into that matter I took our wheel reports that are made by the conductors and which were largely used by the state; and from that drew off the running time of the local trains between Little Rock and Texarkana; and of the through train between the same points, during the month of October, 1907, for each of the 31 days.

We found that the average running time of the through train was sixteen hours and seven minutes. And that the average running time of the local train was 25 hours and 18 minutes.

That would indicate a difference of about 57%.

Then going further we took the line between Hoxie and Argenta and the average running time of the through train for that
4600 entire month was 10 hours and 35 minutes; and for the local train it was 20 hours and 45 minutes, a difference of 96%.

Some of the witnesses for the state have testified that they believed that that was some indication of the amount of swiching that was done by the local engine.

If that is a unit that can be used to compare the relative service, it seems to me the actual time consumed by those trains would come nearer than the timecard or the schedule time, because our experience has been that very few local trains make their schedule time.

Q. Mr. Wilmering in his testimony took the position that the cost of each locomotive should be ascertained and divided on the basis of the mileage made by the engine, in ascertaining the cost of the locomotive under the head of "Maintenance of Equipment."

Is such a scheme as that practicable, Mr. Johnson?

A. My understanding of Mr. Wilmering's testimony was, that he thought the repairs of each yard locomotive should be ascertained and that these repairs should be divided between the class of cars switched by that locomotive, and such a basis as that is impracticable and could not be compiled from any system of records that the railroads might adopt.

In other words, no railroad could undertake to keep a record of the number of car miles in local and through and strictly switching

service, that might be handled by the individual switch
4601 engine in any yard.

Q. The same witness also testified that station expenses should be divided on the basis of the number of tons handled and that the tons handled should be doubled in the case of state freight, and one additional terminal should be added to interstate freight for each 100 miles of average haul:

What do you think of such a method of ascertaining the average expense?

A. I do not believe that method is at all right; and especially so so far as station expense is concerned, because after the freight is billed and loaded and incurs all the expense that is incurred by a ton of freight for forwarding, certainly that expense would not be multiplied every 100 miles of that ton movement.

I think the exhibits introduced by Mr. Moore would show that beyond any shadow of doubt.

The cars might be billed from St. Louis and certainly would receive no service at the hands of any station agent in Arkansas.

Q. Mr. Hillman testified that the cost of yard service should be ascertained directly as between state and interstate on the basis of the tons instead of dividing that item between local and through trains:

What effect upon the result in the figures produced by the state here would such a division as that have, if divided in the manner suggested by that witness?

4602 A. If the total yard service, which amounts to $293,000, were divided between state and interstate business, it would then result in the same percentage of that total expense being charged to state business as was used in the case of station service; or practically one-third of all of the yard expense upon that basis would be charged to intrastate freight. And then that would assume that every ton of interstate and every ton of trans-state freight received a full yard service within the state of Arkansas.

Now, in an amended exhibit (Number Y) the state has changed this method of dividing station service by eliminating trans-state freight, and if that is done to yard service as well, it would result in a charge of almost 50% of the total terminal expense, or practically $140,000 being charged to state freight.

The result would tend to very materially reduce the percentage of return upon the value of the property, so far as state freight is concerned.

Q. What amount is chargeable to state freight upon the basis adopted in the exhibits filed in this case?

A. The yard and terminal expense is divided by the state in Exhibit K, first as between local trains and through trains.

Then the expense apportioned to each class of trains is divided between state and interstate tonnage on the ton mile basis.

The result of that is that $23,468.64 has been charged to
4603 state freight on account of yard service.

Q. On Mr. Hillman's plan it would be what?

A. If we were to adopt the tonnage basis and charge to interstate

and trans-state freight one full terminal handling, then the proportion of the total expense that would be assigned to state freight would be $97,782.

Q. And that would be the result of the working out of the plan suggested by Mr. Hillman, would it?

A. Yes, sir.

Right in that connection, on that same page of Exhibit K, I would like to call attention to a statement that is made there and I think has been overlooked by the state:

Under traffic expenses at the head of page 4 they say "These expenses are incurred in securing and looking after traffic."

"The amount apportioned to the state of Arkansas is based on the revenue train mileage in that state as compared with the revenue train mileage of the whole road."

Our traffic expenses are apportioned between states on the basis of the gross earnings and not the train mileage. That is shown in our statement 5 on Exhibit 3, and I think our basis for dividing that expense between states is in exact accord with the basis adopted by the state in dividing the proportion that is assigned in Arkansas, between state and interstate. That is, the gross earnings basis in both cases.

Q. What do you think of the way in which "Other train expenses" is attempted to be apportioned on Exhibit K?

4604 A. I do not believe we can come any closer to the expense incurred by local trains and the expense incurred by through trains, by a division on the train mileage of such accounts as are included in this item than we can under maintenance of way and structures.

Out of a total of $132,000, 73% of that amount is made up of such items as wrecks, injuries to persons, damage to stock on the right-of-way, and fires set out by sparks, and damage to other property.

In the next item, loss and damage to freight, the state has undertaken to assign directly to state and interstate freight the amount of expense taken into account in that month, for loss and damage to freight; and the result of that is that they found 24.29% of the total expense under loss and damage to freight was paid for damage to intrastate shipments.

Now, that was an actual ascertainment from the vouchers themselves. And so far as the greater part of the damage to stock, wrecks, injuries to persons, are concerned, that expense could have been located either to the local train or the through train with the same degree of exactness as the loss and damage to freight was.

I do not believe the train mileage has anything to do with that class of expense at all.

Q. Mr. Johnson, you said the cost attributed to state freight on account of loss and damage to freight was actually located and was 24.29% of the total:

4605 Is there any other item which was actually located by the state accountants in going through these figures?

A. The nearest to an actual allocation of expense to that was the wages paid train crews.

They took that from the time books, showing the amount paid the crews upon each train run.

The only difference between that method and an exact amount would be the question of overtime and the last two or three days of each month that might not get into our time books.

But this actual allocation of loss and damage to freight resulting in a charge of 24.29% results in a larger charge in these accounts for state freight than the revenue basis would assume, even with 100% added for extra cost.

Q. I will call your attention to the division of general expenses in Exhibit K:

Will you state what you think about that method?

A. I do not believe the amount of money that is expended in the operation of a railroad say for expenses in the transportation department has anything to do with the cost of operating our general offices.

The greater portion of general expenses consists of the salaries and expenses of the employes in the General Auditor's office. And, in turn, the greater part of the General Auditor's expense is for the purpose of accounting for the revenue of the railroad company.

4606 It also includes, for instance, the freight claim department, which is the largest single department in the General Auditor's office.

I cannot conceive of any way by which the cost of maintenance of equipment and the cost of maintenance of way or the cost of the transportation department has anything to do with this expense.

A large item under "General Expenses" is our Legal Department And the increase or decrease in the amount of expenses in the law department bears no relation whatever to the expense of the several operating departments of the railroad.

I do not see how dividing the general expenses on the basis of the fixed charges in that department would bring about a very close cost.

Q. You mean to show what is the proper relation between the two?

A. Yes, sir.

Q. Our old friend Mr. Wilmering, whom we have been quoting here, also said in his testimony that the ton mile is the standard measure or unit of freight cost in the real art of railroading, and has been used for many years.

He further says the results are accomplished after great expense and the compilation from waybills and that it is an expensive undertaking and if there was no real use for it why should the railroads work it up. And if it is not a good unit why should it not be discarded.

4607 Yet the railroad companies instruct their operating men to watch their cost per ton mile:

I wish you would state if Mr. Wilmering's impressions are correct and also state what is the real purpose of those several units that have been discussed here, as they are used in the operating accounts of a railroad company?

A. I do not think the cost per ton mile is a unit upon which the

operating official depends exclusively in judging of his operating performance.

These operating statistics that Mr. Wilmering undoubtedly has in mind deal with three units, for these comparative purposes. They show the cost per train mile, they show the cost per car mile and they show the cost per ton mile.

I do not believe that any operating official ever uses one without the other nor do I think the general operating official would ever criticise the cost per train mile or per ton mile upon an operating division in Missouri as compared with an operating division in Arkansas.

Nor would they compare that relative cost as between any two operating divisions, even in one state.

The real use which is made of this cost per ton mile unit in the operating department is to judge of the individual operation of one division through different periods of the year and during different years.

I believe that the cost per ton mile as understod by Mr. Wilmering has been discarded by most of the railroads and instead of
4608 using the cost per revenue ton mile the railroads are now getting down to a basis of cost per gross ton mile, including not only the freight but the weight of the car. And I think, too, that they are getting away from the cost and dealing rather with the physical operations. I do not think that the cost per ton mile as an operating unit was ever given the consideration and the value that a great many people seem to think it has.

So far as our road is concerned, we have tried twice since May, 1900, to devise some better scheme for showing the comparison on the various operating divisions. And perhaps sometime we will reach a unit that will be satisfactory to the operating man—but we have not done it yet.

Q. Mr. Johnson, has your work been connected with these units?

A. When this operating sheet was established in 1900 on our road I was transferred to that department and in July, 1902, I was placed in charge of the department and my duties were entirely in connection with figures of that kind, up to the time I left the Auditor's office.

Q. So you had the opportunity to familiar knowledge of these statistics and the purpose for which they were used?

A. Yes, sir, I have compiled them ever since our road had them.

Q. What do you think of the method pursued by the state accountants in Exhibit K, in dividing the state and interstate ton
4609 miles for six months between local and through trains on the basis of ton miles, of October, 1907, instead of using the October percentage as they have done in every other case.

A. I think if this general scheme is worth anything it would have been fairer to the railroads if they had adopted the percentages they found to represent the volume of *of* business moving on those trains, in the month of October, rather than to have adjusted it to the six months ton miles.

They have used percentages based upon October figures in ascer-

1993

taining the cost under each expense account; and then in undertaking to find out how much of the total local train expense should be assigned to state business, they take the percentage of the state and interstate business on the local trains applied to the ton mileage for six months.

The conditions might be entirely different in the month of July or in the month of November. I do not believe this method reduced the general percentage to any more correct basis than the October percentage itself would have done. And it results in a reduction of practically 2 1/2 per cent of the total expense on the local trains and about 2/3 of one per cent in the total expense of the through trains being assigned to state freight.

If the railroad itself had applied the same basis in compiling its figures and had used the revenue percentage for one month rather than six months, we would have brought about an entirely different result in our net earnings and percentage of return upon the
4610 value of the property.

It seems to me it shows that one month's percentages are hardly fair, especially when you take into consideration the amount that is involved.

I do not see that this basis gets any closer to the desired results than would have been the case had they taken the percentages for the month of October. It simply brings about a different figure.

Q. What do you think of the disposition made by the state's accountants in this exhibit of miscellaneous freight revenue, or, rather the use that has been made of it.

A. In Exhibit K the state has undertaken to divide miscellaneous revenue of $122,000 between the state and interstate traffic on a basis of the percentage of actual freight revenue.

I believe I testified in the original examination that I did not believe that could be done. I do not believe so yet.

Q. I want you to state in that connection why. Give the reasons why you think it cannot be done?

A. The reason is that in this $122,000, there are items that bear no relation to the actual freight earnings.

We have included in the $122,000, an item of $37,000 for switching service.

I do not understand the percentage of state freight to the total freight revenue has anything to do with that switching revenue.

4611 There is an item of 520,000 for car service:

The same objection would apply to that, that applies to the switching revenue.

There is $55,000 for miscellaneous rents:

I do not think items of that kind are divisible between state freight and interstate freight.

Q. Up to this point I have examined you in connection with Exhibit K and in regard to such matters as I thought you would be familiar with from an accounting standpoint.

If there are any other matters I have omitted, they have appertained to operating conditions with which you are not so familiar.

I want to call your attention to a few matters connected with Exhibit M, of the same class, relating to accounting matters, about which I examined you in connection with Exhibit K.

Please turn to "Traffic Expenses" on page 2 of Exhibit M:

You will find nearly 20 per cent of that expense is charged to mail and express. I want you to state what relation, if any, there is between that expense and mail and express:

I should like to get that clearly stated and you should know something about that?

A. So far as the accounts of the Iron Mountain Railway are concerned, I do not believe the traffic expense bears any relation to the mail and express service.

4612 There is no soliciting of express business nor is there any soliciting of the mail.

The compensation that accrues to the railroad is by contract.

There is no official whose salary and expenses are charged to this account and has anything to do with the making of those contracts.

If the state is attempting to adopt bases that will come nearest to reflecting the actual expenses, then the revenue basis, which includes over 19 per cent of mail and express earnings, is not the proper basis on which to divide this $53,000.

The handling of our mail business is practically all done by a separate department and in our classification the expense of that department is charged to our general expenses. That is, under our classification that was in force when these figures were compiled.

The contract in connection with the express business is handled by our executive officers. And the expense that might be incurred in making that contract or in watching its operation after it is made, would be charged to general expenses.

So I can hardly imagine any expense charged to traffic that would bear any relation to the mail any express revenue.

Q. "Station expenses" I observe they have also divided on the basis of the number of passengers handled:

4613 What are your views in regard to that?

A. I think any rule that would require these expenses to be divided on the basis of the number of passengers handled ought to be used in exactly the same manner as would a similar expense be divided under freight. That is, the trans-state passengers ought not be charged with any more of those expenses than would the trans-state freight.

The amount involved is perhaps small, but under this basis it assumes that all trans-state passengers incur just as much station handling or just as much station service as the intrastate passenger, who may originate at a station in Arkansas or is destined to a station in Arkansas.

Q. To use Mr. Doddridge's illustration, the trans-state passenger is the man who goes through from the borders of the state and is carried like a man going over a bridge?

A. That is my idea of a trans-state passenger.

Q. Perhaps the bridge simile would be a little closer there than in the freight matter, would it not?

What station expense is incurred in regard to the trans-state passenger, who has no occasion to get on or off the train and no call for any station service?

Is there any service at all rendered at a station in Arkansas to a trans-state passenger? You have traveled on the trains. You know they have a dining car. I don't know of any service that would be rendered to him, and I want to know if you know of any?

4614 A. If the passenger buys a through ticket to a point reaching beyond the state of Arkansas, I cannot conceive of any item of expense which should be included under station service, that would be charged to that passenger.

Q. It is the universal rule that trans-state passengers, as well as all other passengers, buy a ticket from the origin to the end of their trip?

A. Yes, sir.

Judge HILL:

Q. Suppose you had a fellow who was going from Coffeyville, Kansas, to Memphis, Tennessee over your line, what station service would he have in Arkansas?

A. If he had a through ticket I do not see that he would have any station handling in Arkansas.

Q. What about Memphis?

A. If that is the final destination, there is very little expense at Memphis that would be incurred.

But that is an exception in Arkansas, where we have our Memphis expense in here (indicating exhibit). I had not thought of Memphis.

Q. Take it at Fort Smith. There is the same proposition there, isn't there?

A. From Memphis to Fort Smith? He would not be a trans-state passenger.

Q. He would be an interstate passenger, with two handlings?

A. Yes, sir.

Q. Suppose you had a trans-state passenger who took one

4615 of your trains in Missouri, say the Hot Springs special at St. Louis, and changed at Little Rock to the through train going on to the City of Mexico, would not he have one station handling at Little Rock?

A. No, sir, I cannot say he would incur any of the expense charged to this account.

Q. Would not he use that station just like any other passenger getting off at Little Rock?

A. He might use that station but the maintenance of that station is not charged to "Station expenses".

Q. He would have the same service, whatever classification that might be, as would the man who would get on at Little Rock and go on to San Antonio?

Col. MOORE: In these station expenses?

Judge HILL: What character of expense are you talking about there?

Mr. JOHNSON: Station expenses—the wages of the agent and his office force.

Q. If the man who got on your train at Little Rock was going to El Paso, he would have one handling?

Col. MOORE: He is an interstate passenger.

A. He would buy a ticket and get service from that station force.

Q. Suppose a man came down from St. Louis on the Hot Springs special, but could not go on with that train further, he would get off at Little Rock, take his baggage off, and then pursue his
4616 journey from Little Rock to Texas on another train. What would be the difference between him and the man who got on the train at Little Rock in the first place?

A. I don't know what he would be doing on that train, in the first place.

Q. Assume that he did that. I know some folks did that.

A. If he did get on that train and bought his ticket at St. Louis for El Paso and changed trains at Little Rock, he would not receive any attention at the hands of the station force, to any such extent as the passenger who buys his ticket and checks his baggage at Little Rock.

Q. He would receive attention?

A. He would receive attention from the station force if his baggage was transferred from the Hot Springs special to the Texas train. But if the baggage had been checked and sent on through, he would not receive even that service.

Col. MOORE: In railroad practice, if there are two trains going out of a station, one a trans-state train and the other you might call a local train in the sense you speak of the Hot Springs special, would a baggage man send baggage that belonged to the trans-state passenger over the special train, even though the passenger for some purpose of convenience might want to get off at Little Rock? Would not he ship it off on the through train from St. Louis?

A. I do not know positively but that is my impression, that he would do it that way.

4617 Judge HILL:

Q. That passenger while waiting in Little Rock would receive the benefit of the heat of your station, and good drinking water you had there for him and the light, and the cleaning force, and all of those manifold blessings that are heaped upon the passenger visiting that station—in 1907.

In other words, the point I want to make is he would be treated just like the other man except for his ticket and baggage, would he not?

A. Yes, sir, and to this extent: that of the station service that is treated of in this item, amounting to $57,000, not more than 3% would be included in that heat and light and "other blessings" he would receive as compared with the service that would be rendered by the station force proper, that is, the labor.

In other words, the heat and light chargeable to station service is a very small part of the total station expenses.

Q. Cleaning is the smallest part—I mean for the old station.

Col. MOORE: That was infinitesimal, I think we can all agree.

Col. MOORE:

Q. (Resuming:) Counsel called your attention to the Memphis situation: what proportion of the trans-state passenger traffic would be affected by that situation?

A. I have no idea what proportion of the trans-state pas-
4618 sengers credited to Arkansas would originate or have its destination in Memphis.

Q. It would be an infinitesimal proportion, would it not?

A. I would not care to even estimate it.

Q. In the general expenses of this exhibit, the salaries and expenses of train auditors is included, is it not?

A. Yes, sir.

Q. What do you say to the propriety of dividing that on the basis adopted there, of direct charges?

A. The state has undertaken to set up a basis that they believe represents the actual service performed under each of these oprating accounts.

If that is a proper method to use the expense incurred on account of train auditors, which is included in "General Expenses", merely for the purpose of comparison, should be eliminated from this account; and not divided upon the same basis that the balance of the general expense items should be divided.

Q. On what do you base that opinion?

A. The train auditor's expense is an expense in connection with the handling of passengers upon the train.

The Interstate Commerce Commission itself provides that this expense shall be charged to transportation expenses, but under the system in force in the Iron Mountain office prior to the Interstate Commerce Commission classification, this expense has always been charged to general expenses, because they are employees who report direct to the general auditor.

4619 Under our present method, where we conform entirely to the Interstate Commerce Commission classification we include this item under transportation expenses.

But the unit that would indicate the expense of train auditors is entirely different to the unit that would be applicable to all these other items under "General Expenses". And it seems to me that an item which is some forty odd thousand dollars should be treated separately.

Q. They have no service to perform except in connection with the passengers on the train, do they?

A. That is all. The collection of tickets and the collection of cash fares. They have nothing to do with the train movement itself.

Q. Down at the bottom of page 4 of Exhibit M, where they seek to divide the cost of coach and Pullman service between intrastate and interstate, they have in that first table there assumed passenger miles 73,842,620, and they have divided that on the percentage which each of those classes of passengers bear to the total.

Does that include Pullman mileage?

A. The passenger miles they have used as basis for dividing coach expense also includes the Pullman car mileage.

Q. Then have not they divided the Pullman mileage below on a different basis?

A. Then in dividing the Pullman expense they assume that whatever passenger miles were carried in Pullman cars were
4620 approximately 25% state passengers and 75% interstate passengers.

The result is that they have practically used the Pullman passenger mileage twice.

It is a factor in the percentages that were used to divide the coach expenses.

Now, if not more than 25% of the Pullman passengers are state passengers that would indicate that 75% of them were of much longer haul than the state business. Or, to put it differently, the interstate passengers are of much longer haul than the state passengers, and the result would be that by reducing the total passenger miles to the extent of the Pullman passengers, the change in these percentages would be very substantial; because you would reduce the interstate passenger miles in larger proportion than you would the state passenger miles.

Q. What difference would it make in the figures, Mr. Johnson?

A. In the month of October, 1907, the records of the company show there were 2,188,495 passenger miles in Pullmans while the total passenger miles during that month were 12,566,398.

Assuming of the two million Pullman car passengers 25% were state passengers and 75% were interstate passengers, it would make a difference of about 8% in the coach expense chargeable to state passengers. That is, it would increase the cost of handling
4621 state passengers in coaches, about 8%.

Q. That is a large item, is it not?

A. Yes, sir.

Q. What is the amount of it. I mean the total coach expense?

A. $896,378.

Q. That would make a very substantial difference, would it not?

A. Yes, sir.

Q. Have you made any check of the passenger car mileage used in this exhibit, for the purpose of ascertaining whether it was correct or not?

A. Yes, sir, we checked the passenger car miles as shown by the state in their exhibit, and found some slight variation.

The result of our check shows that there were 785,703 coach miles as against 751,229 coach miles. This makes a change of about 2% in the percentages.

Q. That is for one month, is it not?

A. Yes, sir.

Q. Multiply that by six months and that difference would be exaggerated probably, would it not?

A. No, sir, it would still make the same difference of 2% in the six months' mileage.

Q. What I mean is, that the effect upon the revenue for the six months' period would be changed?

4622 A. The effect of that 2% on the total expense for the six months, is of course a considerable item. But the difference in that mileage more than anything else indicates that one month's percentages are hardly fair to decide six months business upon. That is the point brought out by a comparison of the gross earnings for six months as against the gross earnings for one month.

Our Exhibit shows that the percent of state freight earnings to total freight earnings was 13.41. While the month of October (one of those six months) it was 14.75%.

While that difference is small, being about 1.34%, yet when it is applied to the total operating expenses for six months, it would have resulted in an additional charge to the state freight of over $45,000.

Had the railroads used one month's percentage instead of six months, we would have charged to state freight $45,000 more than we did.

While the difference in percentage is small it might make a difference in the result applied in this manner.

Direct examination of Mr. FRED P. JOHNSON continued.

By Mr. MOORE:

Q. I believe the local car miles in Exhibit I includes cars

4623 hauling company material.

A. Yes, sir, that is my understanding.

Q. How many of them are there?

A. There are more than 3,000. I do not remember the exact number.

Q. Is the company material in local and through trains included in the tonnage statistics in that exhibit?

A. No, sir, the tonnage statistics included in Exhibit I are merely revenue tonnage.

Q. What effect would that have upon the average per car, as shown on the exhibit?

A. I think the fact that the car mileage includes the cars hauling company material would have the effect of decreasing that item of the average loading of freight per car. And I think it would decrease it very materially.

Judge HILL:

Q. Do you mean both local and through?

A. Yes, sir.

Col. MOORE:

Q. What is the mileage of those cars of company material?

A. The car miles of company material would be approximately 90,000 miles; that is, of local trains.

Q. Mr. Johnson, is the assumption that the increase in the average revenue per ton per mile in January, 1909, as compared with the six months ending December 31, 1907, represents the average in-

crease in rates or revenue resulting from the railroad operation of November, 1908, fair?

4624 A. No, sir, I do not think an assumption based upon the figures that that assumption is based upon is at all fair.

Q. Explain why you think it is not proper?

A. I can explain that better perhaps by dealing with similar figures upon our own road.

Q. Use anything to illustrate it.

A. During the six months ending December 31, 1907, the average revenue per ton mile of state freight on the Iron Mountain road was 13.38 mills.

During the six months from December, 1908, to May, 1909, which was the period in which the Company tariff was in force, the average revenue per ton per mile under the company rates, was 20.95 mills.

Now, had the Commission tariff been in force during that period the average revenue per ton per mile would have been 14.57 mills.

During the month of January, 1909, which is one of the six months in this latter period, the average revenue per ton per mile under the company's rates was 21.63 mills.

Had the Arkansas Commission tariff been in force during that month the revenue per ton per mile would have been 15.01 mills.

During the six months ending November 30, 1909, which is a six months' period under the Court tariff, the average revenue per ton mile was 16.85 mills. And had the Commission tariff been in force during that period the revenue per ton mile would

4625 have been 13.36 mills.

That shows that the percentage of increase in the average revenue per ton per mile in January, 1909, under the Company's tariff as compared with the six months ending December 31, 1907, under the Commission tariff, was 61.7%.

The percentage of increase in the average revenue per ton per mile in January, 1909, under the Commission tariff as compared with the six months ending December 31, 1907, was 12.2%. While the percentage of increase in January, 1909, under the company tariff as compared with the same month under the Commission tariff was 44.1%.

That shows that the increase in the average revenue per ton per mile in January, 1909, brought about by the increase in rates was 44.1%.

The increase in January, 1909, under the company tariff as compared with the six months period ending December 31, 1907, was 61.7%. And this latter per cent would compare with the 96% which has been referred to as applying to the Cotton Belt in this case.

This statement indicates that the month of January, 1909, shows an increase of 12.2% in the average revenue per ton mile under exactly the same rates.

Q. The Commission rates?

A. Yes, sir, the Commission rates.

And that increase of 12% is brought about by the difference in

the commodities and the difference in the length of haul and the various other items that would naturally change the revenue
4626 per ton per mile, other than changes in rates.

The statement shows that for six months ending November 30, 1909, under the existing Court tariff, there was an increase of 26.1% in the average revenue per ton per mile.

Q. Have you a statement showing those percentages to which you have just referred?

A. Yes, sir.

Col. MOORE: I will offer in evidence the statement just identified by Mr. Johnson.

The paper referred to is marked "Complainants Exhibit 54."

Said exhibit is in the words and figures following to-wit:

For Exhibit 54, see Volume 8, page 5722.

4627 Q. Mr. Swain's Exhibit 23, showing the average reduction in rates made by the Arkansas Commission, is made on five different distances without regard to the average volume moved under each distance or the average haul of the commodity moving.

Can the average reduction be shown in any such way as that?

A. No, sir, I think that is merely an assumption on Mr. Swain's part and of course it was not based upon any actual data.

The average could not be ascertained in that way with any degree of accuracy.

Taking those same commodities that Mr. Swain referred to there was the reduction on bagging and ties. That percentage for 25 miles was 21%.

For 100 miles 39 percent.

For 200 miles, forty-nine percent.

And the average arrived at, as Mr. Swain did, was 39 percent.

Now, if the greater volume of business in that commodity moved 200 miles, then the actual decrease in revenue of the railroad would have been nearer 49% than 39%.

While, on the other hand, if the greater part of the bagging and ties moved 25 miles, then the reduction in the revenue to the railroads would be less than the average Mr. Swain showed.

4628 And without the movement of those various commodities it would be a hard proposition to undertake to estimate the decrease in the revenue that would accrue to the railroad by any change in the tariff.

Q. Does the Iron Mountain Railroad keep and furnish its traffic men statistics relating to the movement and the volume of traffic to aid them in making rates?

A. Yes, sir, it furnishes the traffic department and all departments of the railroad with a large number of statements bearing upon this subject.

Q. State what they are.

A. One of the statements that is furnished by the Auditor's office to the traffic department is a statement similar to that filed by Mr. Roth this morning, showing the revenue and the ton miles of a large number of individual commodities.

That statement shows all of the information that is necessary in

order to obtain the length of haul, volume of business, and the average revenue received per unit.

They are being furnished sometimes with weekly reports and sometimes with daily reports showing the car movement and the direction of tariff and the increase and decrease in any particular commodity.

Q. Mr. Wharton filed an exhibit in this case( which is marked Exhibit Z) containing a comparison of transportation cost per train mile for the years, 1907, and 1897; and the same on the St. Louis Southwestern Railway:

4629 I wish you would state how the traffic conditions of those two years compare with other years and if this comparison of two years would afford a fair comparison?

A. Exhibit Z shows that the operating revenue per train mile upon the Iron Mountain during the year ending June 30, 1907, was $2.17; for the year 1897, it was $1.45; showing an increase of 50%.

The operating expenses for the same two years shows an increase of 40%.

The net revenue per train mile shows an increase of 69%.

I do not believe that kind of a comparison of those two particular years is fair.

The statistics shown by that exhibit were taken from the annual report to the Interstate Commerce Commission for the year 1897, and in the opening statement of that report (On page 9) it has this to say:

"A review of statistics of operation since 1890 would disclose the fact that each year ending June 30th, from 1890 to 1893 inclusive, closed with an increase in net and gross earnings as compared with the previous year.

The year 1893-1894, however, proved to be a disastrous one for railways, the gross earnings being less than $147,000,000 and the net earnings $50,000,000, than the corresponding items of the previous year.

The year 1894-1895 showed practically no recovery from the depression of the previous year.

4630 The year 1895-1896 closed with an increase in gross earnings of $74,000,000 and net earnings of $27,000,000. But this movement toward better conditions did not continue during the year covered by the present report, which as compared with 1896 shows again a decrease in gross earnings of $28,000,000 and in net earnings of $7,000,000.

It was not until June, 1897, that is to say, the last month of the twelve covered by this report that the railway earnings showed a healthy revival of commercial conditions. This fact indicates the character of the year covered by the present report and must be held in mind by one who endeavors to interpret the figures about to be presented."

On the other hand, the testimony in this case shows that the year ending June 30, 1907, was one of the best in the history of the railroads.

Q. That is just about the poorest year that could be taken for a comparison of that sort?

A. It does not appear to be a fair comparison.

Right in connection with that, the annual report of the Missouri Pacific Railway for the calendar year ending December 31, 1897, which would cover part of the period covered by this Interstate Commerce Commission's report, has this to say:

"With the advent of 1897, a general improvement in business was predicted; and while this has been realized in some directions it would appear from facts and figures that the improved conditions were not of such a character as to proportionately benefit passenger travel until the latter half of the year.

4631 The most practical explanation of this seems to be that the farming element, which constitutes a large percent of the travel of western roads, being dependent upon their produce did not experience the benefit of the improved conditions until after they had realized upon their crops. And a synopsis of the earnings for the year shows the entire gain to be for the last five months".

Now, that refers to the months of August and December, inclusive, which would not be a part of this comparison.

Q. The years of that comparison end with June of the year mentioned?

A. Yes, sir.

Q. Exhibit F-1, filed by the same witness, I believe, is a comparison of passenger statistics for the same years, is it not?

A. Exhibit F-1 shows a comparison of various traffic statistics for the year 1897, compared with the year 1907.

Q. That is years ending with June 30th, being the fiscal year?

A. Yes, sir.

Q. State if that is a fair comparison for the periods?

A. The same criticism that may be made in connection with Exhibit Z would also apply to this. It compares two periods entirely different in their character; and in addition to that, so far as the passenger service on Exhibit F-1 is concerned, it gives no consideration to the change in revenue brought about by the two cent passenger fare.

Q. Mr. Johnson, those two years represent rather extreme conditions of prosperity and depression, do they not?

A. Yes, sir.

4632 Mr. Wharton filed an Exhibit showing the results of operation on the Iron Mountain Railroad, based on what purports to be Judge Farrington's formula in a decision rendered in the case of the Southern Pacific R. R. vs. Bartine, reported in the 170 Fed. Rep. at page 725:

Now, Mr. Johnson, will you prepare and file a statement showing what would be the result in this case, under Judge Farrington's formula, as we interpret it, and file with it extracts from the opinion of Judge Farrington, upon which our interpretation is based?

A. I have prepared such an Exhibit.

Col. MOORE: I will offer in evidence this statement.

The paper referred to is marked "Complainants' Exhibit 55. Exhibit 55 is in the words and figures following, to-wit:

For Exhibit 55, see Volume 8, page 5724.

4633 A. I would like to say in explanation of this Exhibit 55, that there was nothing in the case decided by Judge Farrington relating to passenger business; it was a freight case.

In Exhibit G-1 the State shows the net earnings from intrastate freight ascertained under this method to be $200,000; and then adds to that the net earnings from intrastate passenger traffic, ascertained under their formulas to have been $134.000, showing the total net intrastate earnings to have been $334.000 for the six months period.

In making this calculation on our Exhibit 55 we find the net earnings from intrastate freight to be $140,000 and have added to that the net earnings from intrastate passenger traffic, ascertained on the formulas outlined by the Railroads in filing their Exhibit 3.

The result is, that so far as the passenger service is concerned, the result will be upon two entirely different formulas. The difference in opinion is confined to the application of Judge Farrington's formula to the freight service.

Q. State what result is shown in the way of net earnings by the formula you have filed?

A. Exhibit 55, net earnings freight, on intrastate business amounts to $157,174.17. This is equal to 3.51% return upon the assessed valuation of the property in 1907; and 2.92% upon the assessed valuation of the property in 1909.

4634 The difference in opinion is confined to the application of Judge Farrington's formula to the freight service.

Q. State what result is shown in the way of net earnings by the formula you have filed?

A. Exhibit 55, net earnings from all intrastate business amounts to $157,174.17.

This is equal to 3.51% return upon the assessed value of the property in 1907; and 2.92% upon the assessed valuation of the property in 1909.

Q. Have you prepared a statement showing what the net earnings of the Iron Mountain Railroad would be on the formulas presented in this case by the state, contained in the exhibits heretofore referred to, with such modifications in certain items of the sub-divisions of those formulas as the testimony introducted on the part of the complainants in this case indicates should be made?

A. Yes, sir.

The paper referred to is marked "Complainant's Exhibit No. 56." Said Exhibit is in the words and figures following, to-wit:

For Exhibit 56, see Volume 8, page 5726.

4635 Have you prepared statements showing what the net earnings of the Iron Mountain would be, on the formulas presented in this case by the State, contained in the Exhibits heretofore referred to, with such modifications in certain items of the sub-divis-

ions of those formulas as the testimony introduced on the part of the Complainants in this case indicates should be made?

A. Yes, sir.

Col. MOORE: I will offer in evidence the statement prepared by the witness.

The paper referred to is marked "Complainants' Exhibit 56.

Exhibit 56 is in the words and figures following, to-wit:

For Exhibit 56, see Volume 8, page 5726.

4636 Q. I will ask you to make such explanation of those as may be necessary to enable the changes made by you in the formula to be clearly understood.

A. Exhibit 56 starts out with the item of "Maintenance of Equipment-Locomotives."

In dividing this expense between yard and local and through trains we have adopted the basis outlined in the state's exhibit.

In dividing the proporton chargeable to yard locomotves, instead of dividing that between local trains and through trains on the basis of the number of cars handled, we have divided it between intrastate and interstate freight on the basis of the number of tons handled and we have included all of the trans-state freight in the interstate.

The next sub-division is "Freight cars repairs (B)".

This item has been divided between "Stopping and Starting" "Terminal Handling" and "Other expenses," upon the percentages suggested in Mr. Rosing's testimony, making a change of about 20% in the charge to stopping and starting and terminal handling as compared with the percentage used by the state.

In dividing the amount chargeable to starting and stopping, between local trains and through trains, we have multiplied the car miles on local trains by eight instead of by four, as was done in the state exhibit K.

4637 The terminal expense and the other expenses under freight car repairs have been divided on the basis outlined by the state.

The next item "c" is "Supervision in General" under "Maintenance of Equipment"; and we have divided this account between the local trains and the through trains, intrastate and interstate traffic, on the basis of the two charges as was done by the state in their Exhibit.

The next item, number two, is "Traffic Expenses":

We have adopted in this case the method used by the state and make this division between intrastate and interstate as they did, by using the gross earnings basis.

The next item is "Transportation expenses."

The first sub-division "a" is, "Station expenses" and we have in this case divided the expense between intrastate and interstate on the basis of the number of tons handled, allowing two handlings for state freight and adding to the interstate tons, 10%.

This is done on the assumption that a certain percentage of the

interstate and trans-state freight may have more than one handling in the state of Arkansas.

In this division we have followed the state's method as shown by their exhibit Y, with the exception of adding this 10%.

Sub-divison "b" s "Yard and terminal expenses":

We have divided this expense between state and interstate traffic on the basis of the number of tons handled using exactly the
4638 same percentages as were used in dividing the repairs to yard locomotives, under "Maintenance of Equipment."

This division results in an equal charge under yard and terminal expense to all interstate and trans-state freight.

We have made no change in the method of dividing sub-division "c" fuel and locomotive expense; sub-division "d" engine house expenses; sub-division "E" road engine men and train men; sub-division "f" other train expenses; and sub-division "g" loss and damage to freight.

In each case we have adopted the state's method in apportioning these expenses between local trains and through trains.

Under sub-division "h", supervision and general, we have again adopted the state's method, using the direct charges ascertained under these various formulas.

The next division is "Maintenance of way and structures", "General expenses." Both of those items have been divided between local trains and through trains and intrastate and interstate, traffic on the basis of the direct charges ascertained under each of the other expense accounts.

This method follows the metod adopted by the state insofar as general expense is concerned and places the cost of maintenance of way and structures on a parity with that item.

The next item is "Total train cost": We have divided the total cost of local trains and the total cost of through trains
4639 between state and interstate on the basis of the number of state and interstate ton miles on the local and through trains as shown by the state exhibit I instead of adjusting that October percentage to the six months figures.

Sub-division 7 which includes miscellaneous revenue, taxes, rentals, hire of equipment, and value of property, have all been divided on the basis outlined by the state, reaching the same result, with the addition of the assessed value of the property under the assessment of 1909.

The next page of this exhibit is a summary of the foregoing figures and agrees in form with state exhibit J.

The next page deals with the passenger service:

The first item under the passenger head is "Maintenance of Equipment-Locomotives."

We have followed the state's method there using the percentages that were obtained from a recheck of their car mile figures, and that showed that the state percentage of coach mileage was 56.77 percent of the total mileage, while in our recheck we found it to be 59.38 percent.

The next item "b" is "Passenger train cars": We have divided

this expense between coach, mail and express on the car mile basis as adopted by the state, with this change: that to the coach mileage we have added 100 percent, to take care of the extra cost of maintaining coaches and chair cars as compared with baggage and express cars, and to the mail car mileage we have added 15% to take care of the excess cost of the mail car.

4640 This was done in accordance with the testimony offered by Mr. Rosing.

Sub-division "c" Supervision in General has been divided on the basis outlined by the state, using the revised amounts.

"Traffic Expenses" has been divided between intrastate and interstate on the basis of the gross earnings of each class of traffic, omitting the earnings from mail, and express, and other miscellaneous passenger revenue.

The next headng is "Transportation expenses":

The first sub-division is "Station expenses". This item has been divided on the basis outlined by the state, and the same result is obtained.

We have made no change in the state's method of sub-dividing sub-division "c" yard and train expenses, sub-division "d" loss and damage to baggage; sub-division "e" Supervision and General, using their basis in each case.

The next sub-division is "Maintenance of way and structures":

We have divided this item between each class of traffic upon the basis of the direct charges under maintenance of equipment and transportation.

This basis is similar to that adopted by the state for general expenses.

Under "General Expenses" we have deducted from the total, \$160.767, the expense of train auditors, which amounted to

4641 \$44,872; and have divided the balance of the general expenses between each class of service, on the basis of the direct expenses, using the same percentages that were used in dividing maintenance of way and structures.

The expense of train auditors, sub-division "*b*" has been divided between intrastate and interstate on the basis of the number of passengers carried.

I do not remember what witness it was who testified to that formula but I believe that basis has been mentioned for this item.

Q. You testified to it yourself, that the train auditors should not be included in and divided upon the same basis as general expenses and you gave as a reason that they deal with passengers and not with the class of service that is covered in the division of general expenses.

I will ask you now, assuming for the present purpose that this segregation scheme adopted by the state for the separation as shown on these exhibits is a proper one, then how should that item of expense "Train auditors" be divided?

A. If it is necessary to divide the individual item of train auditors' expense between state and interstate business, I believe the number of passengers handled is the best unit that could be obtained.

The expense itself is entirely different in its nature from that of train expense; has nothing to do with the movement of the train or the car; nor has it anything to do with the length of haul
4642 of the passenger. And so far as the duties of the train auditors are concerned, I should say that the greater part of his time was devoted to the short haul passenger and the cash fare collection brought about by that short haul passenger.

Q. Proceed.

A. The next division is a division of the cost of the coach and Pullman service between intrastate and interstate business:

The method of getting at the passenger miles in coaches is shown at the bottom of this page in the note. The note itself shows that during the month of October, 1907, there were 12,566,398 passenger miles.

The company records show that in October, 1907, there were 2,188,495 passenger miles carried in Pullman cars.

On the state's assumption that 25% per cent of the Pullman passenger car miles is intrastate, the division of the passenger miles for October, 1907, would be as shown by that last paragraph.

We have used that basis in our sub-division 6 and divided the coach expense upon the percentages based upon the passenger miles in coaches; and the cost of Pullman service has been divided arbitrarily 25% to state and 75% to interstate, as was done in the state's exhibit.

To my mind there is this objection to that method of division: that is, that the 2,188,495 passenger miles in Pullman cars repre-
4643 sents the passengers actually carried in the cars. While the 12,566,398 passenger miles which represents the total for the month of October, is the record as taken from the ticket sales and cash fare collections; and it has that same element of lap-overs that appears in the state Exhibit I and is used by them.

I do not believe the lap-overs in passenger service would be as large as the lap-overs in freight. But that difference is there.

Sub-division 7 "Miscellaneous Revenue and dining car deficit"; and sub-division 8, "Taxes, rentals, hire of equipment and value of property" have been divided on the basis outlined in the state's exhibits with the addition of the assessed valuation of 1909.

The next page of Exhibit 56 is a summary of the passenger expense divided between coach cars, Pullman cars, state and interstate, mail and express business, and corresponds with the state's Exhibit L.

The next page of Exhibit 56 shows the gross revenue, total operating expenses and the net earnings obtained as a result of these various approximations.

It also shows the assessed value of the property in 1907 and the percentage of return or the percentage of net earnings to valuation; and the assessed value of the property under the assessment of 1909 with the percentage of net earnings to valuation upon that basis.

It shows the division of freight, passenger, to total intra-
4644 state and total interstate.

Q. State what those per cents are as shown there?

A. Under this basis the percentage of return under intrastate freight traffic, under the assessment of 1907, would have been 2.76%. It would have been 2.29% on the assessment of 1909.

Interstate freight shows a return of 11.1% per cent upon the 1907 valuation and 9.22% upon the 1909 valuation.

The intrastate passenger shows a deficit or a red ink figure of .14% in 1907 and on the 1909 valuation it is .12%.

The interstate passenger is .30% on the 1907 valuation—that is a red ink or deficit figure. And a deficit of .21% on the 1909 valuation.

The total intrastate shows a return of 1.12% on the 1907 valuation and .93% on the 1909 valuation.

The total interstate business shows a return of 9.72% on the 1907 valuation and 8.08% upon the 1909 valuation.

While the return upon the total business is the same as that shown in the other statements, 7.5% on the 1907 valuation and 6.23% on the 1909 valuation.

Q. That is on the basis of the division adopted by the state, is it, that is with the modifications you have pointed out in your testimony?

A. Yes, sir.

4645 Q. And without any allowance for extra expense as between intrastate and interstate except such as such claims that were made under arbitrary allowances and were found in the various sub-divisions of their exhibits and the modifications made by you.

A. That is right. There is no additional allowance to the state freight or state passenger upon the local train.

Q. My purpose in introducing this exhibit with which you have just been dealing is to show to what extent changes in the bases adopted in the sub-divisions will make in the result:

I want to ask you if this scheme of division adopted by the state is not one that can be, by a few changes adapted by a person making the figures under it to meet almost any end he has in view as to the results to be obtained:

I am not asking that with a view of saying that it has been used in this case for any improper purpose. That is not a question for you to pass upon. But I want to ask you if it is not a scheme easily changed by the person making it to reach any desired result?

A. Any change that might be made in the arbitraries under maintenance of way and maintenance of equipment or under transportation, would bring about a corresponding change in the results shown, and in the percentage of return upon the valuation of the property. A reduction might bring about an increase in the percentage of return; or an addition to these arbitraries would bring about a reduction.

4646 A change in the method of dividing any particular item might have a material effect upon the total.

I can see where under the passenger service in dividing the yard and train expenses, which includes this cleaning and casualty account, upon a revenue basis for instance would make a very sub-

stantial loss in the state passenger business. Any change in the method would change, of course, the results.

Q. Mr. Roth has testified that all cotton at compress points and all grain at milling points is charged in these statistics with two handlings, or, rather, it is charged as two tons, a ton in and a ton out: you heard his testimony, did you not?

A. Yes, sir.

Q. If that is correct I want you to take sub-division "a" of transportation expenses, which deals with station expenses (page 4 Exhibit 56) and state if the interstate tons included in the division there between intrastate and interstate does not double all the cotton and all the grain at milling points in view of the testimony of Mr. Roth. That is to say, does it provide for them, count that double, in other words, state what effect that would have?

A. If cotton into the concentrating points, into the compress, is treated as one ton and then when shipped out is treated as another ton it means that every ton of cotton in the interstate tonnage is shown in this item as two tons. And on the basis of the number of tons handled would be charged with two terminal handlings.

Q. How about grain?

4647 A. The same is true of the grain milled in transit.

Q. I overlooked calling your attention to the contention of the state in regard to the effect of the increased rates on passenger revenue:

Have you prepared an exhibit showing that? I wish you would file it with any explanation you wish to make.

A. I have.

Col. MOORE: I offer in evidence this exhibit.

The exhibit referred to is marked "Complainant's Exhibit 57."

Said exhibit is in the words and figures following to-wit:

For Exhibit 57, see Volume 8 page 5740.

4648 A. I think Mr. Kimbell was asked to compile a statement on the assumption that there would be an increase of 35% in the revenue per passenger mile for intrastate traffic without any increase in the interstate passenger traffic.

This statement is one showing the passenger miles and passenger revenue upon both state and interstate business for the six months ending December 31, 1907; and for the six months ending December 31, 1909.

In 1907, the passenger rates were upon the basis of two cents and in 1909 on the basis of three cents, except in competitive territory where it was necessary to meet the 2½ cent rate.

This statement shows that the average revenue per passenger mile for intrastate business during 1907, was 1.93 cents.

The average revenue per passenger per mile in intrastate business for the six months ending December 31, 1909, was 2.63 cents.

The percentage of increase in 1909 over 1907 is 36.2%.

By applying to the 1909 passenger miles the average rate of 2 cents per mile, which was in force during 1907, the average revenue per passenger per mile would have been 1.981; and the percentage of

increase in 1909 over the two cents basis would have been 32.8%. The average revenue as shown by this statement, on interstate business for the six months ending December 31, 1907, was 1.865.

4649 And the average revenue for the six months ending December 31, 1909 was 2.258.

The percentage of increase in 1909 over 1907 was 21.1%.

This shows that there was an increase in the revenue from interstate business when the state rate was increased to three cents.

4650 Cross-examination of FRANK NAY.

By Judge J. M. HILL:

Q. There seems to be a question brought into this case of the accountant versus the operator, as to who should allocate the expenses:

I see you have expressed some views about it: I do not know really whether there is a difference between you and the other gentlemen on that subject or not:

I believe Mr. Ludlam testified that he did not think the operating man was the proper man to design a system of accounting, or to allocate the expenses; but that the accounting officer should inform himself from the operating man of the actual conditions, and plan the division and proper allocation of expenses:

Does that differ particularly from your views of it?

A. Well, as you have stated it, there is not a very substantial difference. What I attempted to say was, that no man—accountant or other man—can determine the allocation of the expenses, without knowledge of the local conditions.

If the accounting officer, who is usually located at some central point, has not definite knowledge of the local conditions, the local operating man who is on the ground and has that knowledge, can

4651 determine better than anyone without the knowledge, where the expense should go. But the accounting officer by possessing himself of that knowledge is then the one to determine.

Q. I think that is about Mr. Ludlam's views as I remember it.

Of course, no one could contend that the accounting officer would know all about the railroad without informing himself any more than the accounting man could devise a cost system for a manufacturing concern without informing himself.

A. I may be mistaken, but my criticism of Mr. Ludlam's testimony was that in one place he stated he would not consult the operating officials.

Q. I think you will find you are mistaken. I think he did not say that but said it was his duty to consult them and inform himself.

Col. MOORE: What he said was that the operating man was the last man to determine how the expense should be finally allocated.

Judge HILL: Well, there seems to be practically no difference between you as I understand the testimony.

A. I think there is no substantial difference, Judge Hill, in the

way you put your question. But the way you put it was somewhat different from my understanding of Mr. Ludlam's testimony. As you put it, I think there is practically no difference.

Q. Is it not a fact that practically all the expenses of the railroad are now being classified under the rules of the Interstate
4652 Commerce Commission and proceed in accordance to the rules promulgated by them?

A. Among the primary accounts or divisions of expenses, yes.

Q. What do you mean by "primary accounts"?

A. I mean the 116 different accounts prescribed by the Interstate Commerce Commission, which refer to superintendence and to ballast, rails, and so on. Those various accounts.

Those are items, Judge, which may be definitely determined. That is, you can lay down a classification, as the Interstate Commerce Commission has done, which shall prescribe with a large degree of accuracy the very items which go into each account. Now what I understood what was in question on this matter of getting the judgment of the operating official and of the accounting official was those expenses which could not be so definitely determined as those covered by this classification does, for example, the difference between passenger and freight, state and interstate.

The Interstate Commerce Commission has not undertaken to prescribe any classification as between passenger and freight or as between state and interstate.

There is where the matter of judgment comes in; and that class of expenses requires actual knowledge of local conditions, in order to determine that question.

Now in this classification of the Interstate Commerce Commission is rails: it is easy to say the rails shall go to rail; ties to ties; ballast to ballast; track labor to track labor; bridges to bridges, and so on.

But when it comes to the division of those bridges and ties
4653 to freight and passenger, state and interstate, that is the thing which requires the knowledge of the local conditions, because it is a matter of judgment.

Q. When the Interstate Commerce Commission classification began there were many conferences between the accounting officials and the operating officials and the statistician of the Interstate Commerce Commission, weren't there?

A. Yes, sir.

Q. Much objection was raised by the railroad accounting officials and operating officials as to the ability to work out such classifications as had been worked out, wasn't there?

A. I don't think I would say that—and I was on the committee of 25 from the beginning, from 1906, which worked closely with the Interstate Commerce Commission during the entire formation of that classification; attended nearly every meeting and am still on the committee. I would not say there was a feeling that such a classification could not be worked out. There was a feeling that such a classification would not be satisfactory to everybody.

Q. I expect that would express the idea better than what I said. Not satisfactory in what sense, Mr. Nay?

A. In the sense that some of us had certain ideas due to our training and experience, that we were not willing to give up.

As for example, the joint facility account. That I think
4654 was one of the things that caused the greatest amount of discussion, more than anything else.

Some had the idea we should have separate joint facilities account as we have now. Others thought we should have nothing of the kind, and the debits and credits should be mixed in with all the other expenses.

Q. It was not a simple proposition, then, to charge rail to rail account and bridge to bridge account and ties to tie account and so on, was it?

A. There was no trouble over accounts of that character. The trouble came over such things as joint facility accounts, depreciation, insurance, which might be distributed over all five headings or might be put in "General Expenses".

Q. Wasn't there quite a controversy over the switching proposition, too?

A. Do you refer to switching expenses or switching revenue?

Q. Switching expenses, I think it was, but I am not clear. I know I have heard something of that and my recollection is it was switching expenses?

A. There was some controversy but that was not so marked as these others. It was not so marked as to fix itself in my mind like these other things I speak of.

Q. Has the classification of accounts worked out by Professor Adams been satisfactory to the railroads?

A. Fairly so.

4655 Q. I think one of these operating gentlemen here the other day testified it was very unsatisfactory?

A. As I stated, it has not been satisfactory to everybody. When I said "fairly so" I meant to infer there were, of course, exceptions.

Q. Wasn't there quite an issue between capital charges and expense charges?

A. Yes, sir.

Q. Wasn't there much dissatisfaction felt over the ruling of the statistician on that, by the operating men?

A. Only as to certain items and of course the item of abandoned property is one that has caused a great deal of dissatisfaction.

Q. The question of replacements has also, hasn't it?

A. I don't know just what you mean.

Q. I mean using the technical term. Suppose a bridge is burned down and another is built in its place, don't you call that "replacement"? What is your technical term for carrying that expense into your accounts? Or suppose a steel bridge is put in in lieu of a wooden one and so on?

A. That is usually considered under the term of "Renewals."

Q. Probably the word "renewal" is what I should have used instead of "replacement". Of course, I don't know anything about your technique.

A. I am not quibbling over words but I simply want to understand your idea, Judge.

4656 Q. That is the idea I intended to convey.

A. No, sir, I don't know that. There was dissatisfaction on the part of some whose ideas were different from what was finally adopted.

Q. That puts quite a rein on the operating man, doesn't it, as to where his expenses shall go or as to his determination of the expense, as to the money charged for these things.

A. Now, again, without appearing to quibble about words, what did you mean by "the operating man"? Do you mean the President?

Q. What do you mean by "operating man"? You have used that term?

A. Ordinarily the operating man means the subordinate operating official, from general manager down, general superintendent or superintendent.

Q. That is the sense in which I mean it.

A. In these days the president is frequently spoken of as the operating head while the financial head may be another man.

Q. I mean the man directing the operating forces, whether he is called general manager, general superintendent, or superintendent. I mean the man who is directing the operation. That is the man I refer to.

A. I think I can make my answer clear.

I do not think the rules promulgated by the Interstate Commerce Commission have put much of a check on the subordinate operating man. They may have put a check on the operating man who

4657 directs the affairs of the company, the man who ranks as president or vice-president in charge of operation. The man who had authority to give instructions to the accounting department.

But to those who were subordinate to the accounting department, I do not think there is much difference now than formerly.

Q. How about the general manager? Do you class him as subordinate to the accounting department?

A. On most roads. On some roads the General Manager appoints the accounting officer and instructs him as to the duties.

Q. The point is this: Since these rules have been promulgated, it is more difficult to put a given item into capital account which should go into expense account than it was before these rules were promulgated? Is not that a fact?

A. Not unless it is an item which does not properly belong in expenses or in capital account.

Q. I do not quite understand your answer, Mr. Nay?

A. What I mean is this: an item which properly belongs to the capital account or to operating expense account, formerly went there just as truly as it does today, barring cases which occur in every class of business, where there are men who want to manipulate the accounts.

Every railroad man is not a saint. I think they average up about the same as other men. But for such men, who had

4658 such inclination, there is a check on them today which did not exist before.

But as to the ordinary course of railroad affairs, the men who wanted to do what is right and intended to do what is right, there is no check now that did not exist formerly.

Q. That would be an opinion as to what was right. A general manager might think it was entirely proper to run a lot of those charges into capital account and be just as honest as you are who would think they should not go into capital account. It might be just a difference of opinion. That man might be just as honest as you and as sincere as you and yet think that the capital account was the proper place for it.

A. Yes, sir, I do not mean to impute any wrong motive where none existed.

Q. In other words, there was a freer rein then than now; isn't that true?

A. Yes, sir, that is true.

Q. I think it is in the testimony of Mr. Kimbell how the capital account was formerly made up by the railroads before these rules went into effect.

I do not think there was anything wrong about it, but the managers of his road thought that that was proper and wanted it done that way. But now under these rules there is a check upon it?

A. Yes, sir.

4659 Q. These rules are largely the work of Professor Henry C. Adams with the aid and advice of many accounting officials of the various railroads and also of the operating men; isn't that a fact?

A. Yes, sir, and I might say that Professor Adams said when he started these rules, it was his idea to get the best American practice and that phrase was used very frequently.

Q. I think he had 25 of you accounting officers with him?

A. Yes, sir.

Q. And he also had many operating men with him in consultation?

A. Yes, sir.

Q. Professor Adams himself never had any operating experience?

A. Not that I know of.

Q. He was the Professor of economics or some chair of that kind in a college, was he not?

A. Yes, sir.

Q. He was a statistician and accountant?

A. Yes, sir.

Q. I will call your attention to the statement you made when you had read the testimony of the state's accountant and he said they would present actual facts as opposed to theories: I will ask you if it is not a fact he stated he would present the actual facts wherever possible; and when not possible they would use the factor

4660 most nearly approaching the actual facts. Isn't that what was stated most frequently in Mr. Wharton's testimony?

I think possibly there is a little difference in the way you stated and the way he stated it.

In other words, here is the point: Those things that were actually

ascertainable they attempted to get; and those they could not, they attempted (whether successfully or not is another question) to get the factor most nearly approaching the actual facts. Is not that the standpoint he gave?

A. I have not looked at that for a few days but my recollection is just as I have stated it here.

Q. Here is probably a fair statement that occurs many places in the testimony.

Mr. Wharton said in answer to the question:

"Do you mean the plan outlined in these exhibits are not based upon assumptions?

A. Yes, based upon assumptions but each assumption is treated separately and not as a whole.

Q. Are the divisions you have made here based on any knowledge and information you may have had in the actual operation of the railroad?

A. No, sir, I have no knowledge of the actual operations of the railroad.

Q. Is it based upon information you obtained from reading the testimony in this case?

A. Quite largely.

Q. And you have taken that as the foundation for the programme that is outlined or the method of division that is outlined in your exhibits?

A. Quite generally, yes, sir."

4661 And further on he stated he obtained all the information he could from operating men.

Don't you recognize and do not the exhibits show (whether successfully or not we are not discussing) that there was an attempt made to get the actual facts where they could, or to use the factor most nearly approximating the true conditions: is not that the way you understood the exhibits?

A. As I say, Judge Hill, my answer to the question regarding this matter,

"I have read the testimony regarding these exhibits, and as I recall it the opening statement was that they would present actual facts as opposed to theory."

Now that is a matter of recollection, either by Mr. Ludlam or by Mr. Wharton. And as you say the term "actual facts" perhaps has a modification all through. But I refer in my testimony to that opening statement.

Q. Taking it as a whole, you understood what was meant, did you not, that they intended to take the actual facts were obtainable, and get the maintenance of way and maintenance of equipment and take the factor most nearly approaching the actual facts. Was not that the way you understood the state exhibits?

A. I understood it, as I stated, that there were no actual facts presented in the state exhibits.

Q. They had wages and fuel and loss and damage?

A. That is only for one month. Those are not actual facts for six months.

4662 And loss and damage were not actual facts for one month, but only a statement for one month.

Q. That is what you mean by your statement here, that you do not find any actual facts?

A. Yes, sir.

Q. And then this is a criticism of the method?

The point I am making, is that you understood from these exhibits what the effort was. You did not understand they were trying to get actual facts as to maintenance of way?

A. Here is what I understood:

In my direct testimony, in my opening statement I frankly said it was an impossibility to actually divide operating expenses between state and interstate traffic.

And Mr. Ludlam in his opening statement stated that I set up a "snow man" and knocked him down. And then followed that up by stating that he proposed to show actual facts.

Now I understood that the state witnesses as opposed to the frank statement I had made, that the expenses could not be actually divided, but that we were making the best approximation we could, were now attempting to make an actual division based upon actual facts.

That is the way I understood it.

Q. That is the way you understood it?

A. Yes, sir.

4663 Q. Well, the testimony speaks for itself. I just wanted to get your understanding.

In criticising this general plan of dividing between local and through you stated, as I remember it, that after they had got the division between local and through trains as to the proportion of interstate and intrastate freight carried on each of those freight trains, they still had the problem before them as to state and interstate as they had before them when they began:

Is that a correct summary of what you said?

A. Yes, sir, that is substantially what I said.

Q. That is the way I remembered it?

A. Yes, that is correct, substantially.

Q. You know Mr. Doddridge, I presume?

A. Yes, sir.

Q. He was put on as a witness in this case on behalf of the railroads in their case in chief. He testified he had been general manager of both these railroads and had served as advisor to counsel in this case and in the Missouri Rate Case.

He testified at page 59 vol. 2 as follows:

"Q. Is not the only difference in cost of the intrastate and interstate freight carried on the same train, the one of the extra terminals? A. There is no difference in the cost of one kind of freight or another kind of freight, arising from a distinction in the terms "state" or "interstate." If the conditions are the same there would be no difference in the cost.

Q. Take freight carried on the same train? A. Well, I say, if the conditions are the same; that is, the kind of freight and all of

the other elements that enter into it, there would be no difference arising from the terms "state" or "interstate".

4664 But the conditions must be the same to say that there would be no difference in the cost, because there might be a difference in the conditions. The character of the freight, the weight, and other things.

Q. Take it, the same kind of freight and of the same character, carried on the same train, where is the difference except in the terminals? A. There would be no difference in the train cost.

Q. I want to read you your testimony in the Frisco Case. I wish to read this statement made in answer to a question:

"So far as the particular freight is concerned, carried on those particular trains, there would be no greater cost in transportation for interstate freight than state freight, except the terminal charge.

In order to ascertain the results correctly, you would have to take into consideration the amount of state freight that is carried upon that train, as applied to the total state freight carried on the other train.

In other words, what I mean to say is, we have to take into consideration all the trains and find out what relation the state freight bears to the whole".

Then he says that is a correct analysis. Do you agree with Mr. Doddridge in that?

A. Yes, sir, substantially.

He says all the conditions must be the same, in order for the cost to be the same.

The division on the ton mile basis at the end for the local trains puts carload and less than carload all together and assumes it costs the same per ton mile to transport a ton of coal as it does to transport a ton of show cases, for instance.

So the conditions are not the same, as Mr. Doddridge points out, and, therefore, the ton mile basis could not be applied.

4665 Q. You are assuming there would be a difference in the character of the state and interstate traffic carried on local trains or carried on through trains?

A. Yes, sir.

Q. I believe I can safely say, Mr. Nay, that in this case there have been a great many witnesses who have testified that that traffic goes hand in hand and that there is no substantial difference between them. I think Mr. Doddridge is one who testified to that, probably preceding this portion I have read to you from his testimony:

In view of that, is it not true that if that freight is of the same character there is no difference in the cost other than extra terminal, and when you get the proportion that is carried on each class of trains you have worked out your problem?

A. I think it would be remarkable, Judge Hill, if the character of the tonnage was the same on both state and interstate; and if all the conditions surrounding it would be the same.

Q. That is a disagreement with this other testimony to which I have referred.

But assume that to be true, that the traffic does go—as the other

witnesses have expressed it—hand in hand and is relatively about the same thing on each of the trains, then is not the conclusion irresistible if that be true it is just a question of the terminal and the proportion of freight on each class of train?

COL. MOORE: Do you mean to imply in that question that
4666 the traffic is the same and the conditions the same or that the traffic alone is the same?

JUDGE HILL: I speak of traffic alone, in the way I put my question?

A. Well, of course, I agree with Mr. Doddridge that if proper allowance has been made for terminals so you have under the direct train costs, that is, cost of transportation, which would be the wages of the train crews, the fuel used in the locomotives, and the train supplies and expenses; and the character of the interstate freight is just the same as the character of the state freight, certainly the cost of transporting a ton of state freight one mile, under those conditions, as regards this particular expense, would be no more than of the interstate freight.

But those conditions would have to be all the same and we would have to assume a proper allowance had been made for terminals, so what was local in there was strictly train cost.

But, as I have pointed out in here (indicating testimony) the figure left in there is not the train cost. Because maintenance of way and a large number of items, perhaps 90% in my judgment, are items which are not train cost.

Q. This is not speaking just of train cost, but is speaking of the whole cost.

There is not any difference in maintenance of way, whether a ton of freight is being carried as a state ton or as an interstate ton, is there, as to its effect on that expense account?

4667 A. No, sir, the tonnage has little to do with maintenance of way.

Maintenance of way expenses are caused by deterioration and the necessity of renewal from time to time, because they have lived their life—the bridges, ties, rails and so on.

So the tonnage has very little to do with maintenance of way expenses.

And the tonnage does not govern maintenance of equipment expenses.

What I say is that the strictly train expenses, wages of the train crews, fuel and so on, that come under the head of strictly train expenses, excluding maintenance of way and maintenance of equipment and some items of transportation expenses, are the ones where the cost would be the same.

Q. These maintenance of way expenses were all kept up in order to haul this tonnage, of course. They are not kept up for ornamentation or philanthropy or anything of that kind?

A. No, sir, they are kept up as necessities.

Q. You have discussed at a good deal of length the question of lap-overs.

You pointed out the objections to using October as a representative month on account of the lap-overs that would exist, going into the following month and were doubtful whether the lap-overs from the preceding month would be equal to that: I believe that is about the substance of your objection on that score to the use of that
4668 month, is it not?

A. That is a part of the objection.

Q. I say, on that score?

A. Yes, sir, on the score of lap-overs.

Of course, I object, Judge Hill, to taking the largest month as representative, irrespective of lap-overs.

Q. I am going to discuss that with you later. But I am speaking of the lap-overs now.

For that to be an effective objection to it, the lap-overs would have to exist in one class of traffic that did not exist in the other. You would have to assume there would be more lap-overs of intrastate or interstate, for instance, or for lap-overs in the intrastate than in the interstate.

If the two classes of traffic went hand in hand, there would be as much lap-over in the interstate as in the intrastate, wouldn't there?

A. It would be an accident, I think, if there should be.

In fact, Judge Hill, if I were compiling figures where I wanted to present an actual statement, I would investigate the lap-overs at the beginning of the month and at the end of the month; and know what they were, or else I would compute the figures for the entire six months.

But on the lap-over questions it seems to me it is up to the man who originally compiled the figures to satisfy himself that the lap-overs did offset each other and offset each other in the two classes of business, also. Otherwise their figures would be entirely wrong.

4669 Q. I am putting you this proposition: there is much evidence here that these two classes of traffic move along hand in hand, a car of coal in the intrastate and a car of coal in the interstate, in their proper proportions. A car of lumber intrastate and a car of lumber interstate, and so on. And merchandise probably more nearly so than with the others.

With these classes of freight moving hand in hand, they move along together at all times.

Now, if this question of lap-overs should affect it there would have to be a difference in the relative movement of the two, wouldn't there?

A. If I understand your question, it is supposing 15% of the total traffic was intrastate traffic during the month of October; that 15% of the lap-overs from September into October would be intrastate; and at the end of the month 15% of the lap-overs from October into November would be intrastate?

Q. No, that was not my question. But that would illustrate the point, probably.

A. I am trying to see if I understand the question.

Q. The point is this: Suppose the intrastate traffic is 15% and the interstate traffic is 85%: the testimony is that that 15% and that 85% would move along coincidently:

Now say there were 15% of lap-overs from one month into the other, would not that 10% of lap-overs reach equally into the 85% and the 15% representative of the two classes of traffic?

A. It might or it might not.

4670 Q. There would have to be a disturbance of that 15% or of that 85%, for the 10% of lap-overs to affect the proposition, wouldn't there?

Col. MOORE: You are assuming in that question that the 15% state and the 85% interstate would move coincidently:

Do you mean in regard to delays, if one was delayed the other would be delayed; and if one did not get into the auditor's accounts the other did not get into the auditor's accounts?

Judge HILL: That is just one of the details.

Col. MOORE: I disagree with you. There is no evidence on that proposition.

Judge HILL: I am assuming that the state and interstate traffic moved coincidently.

Col. MOORE: You cannot assume that on any evidence here so far as lap-overs are concerned.

Judge HILL: I am simply trying to make clear my understanding of the evidence. There is no use arguing it here.

A. I am not positive now, Judge Hill, because in order for these percentages to be of value, supposing every other condition has been met outside of the lap-overs and that they are correct in every other respect except the lap-overs: In order for them to be of value, considering the lap-overs it would be necessary not only for the state and interstate traffic to move coincidently, as you have said, or be delayed coincidently—if there was a congesteion, but it would

4671 be necessary for them to move coincidently on local and through trains.

That is to say, if the traffic is delayed traffic, that moves on through trains, it must be delayed in the same proportion as the traffic that moves on the local trains, because only the traffic on local trains has been computed and the traffic on through trains has been arrived at by deduction.

Q. If you will let me interrupt you there, Mr. Nay, I think we can clear up one phase of that a little:

I do not understand this lap-over proposition is one of delay, necessarily. That question of delay might enter into it. It is freight that gets onto the train too late to finish its journey in that month, in the performance of their work.

A. I am familiar with the practical conditions since 1883, when I started with the Missouri Pacific System.

Q. We will discuss the detail later: I am giving you only the broad proposition now, but I will give you full opportunity later to discuss the detail.

In the lap-over it is a question of not finishing the movement, no matter how well it may move, as well as a question of delay?

A. A shipment may move forward expeditiously and not be delayed at all and still form a part of the lap-overs. But the delays also cause lap-overs.

Have you understood me that delays alone caused lap-overs?

4672 Q. I rather understood you that the delay proposition was the only one that caused lap-overs and I want to call your attention to the fact that that was not the only feature of these lap-overs.

A. Oh, no, not at all.

I still feel that delays must be more in October than in almost any other month of the year, because the business is heaviest in October.

Q. Is not that lap-over proposition existent in the six months period, also?

A. Yes, sir, but as I explained in my direct examination it is a much smaller proportion compared with a six months' business than with a one month's business.

Suppose you take the six months from July to December, the lap-over from June into July is just the same. Whether you consider that as a six months' period or whether you consider the one month of July.

Suppose 10% of a month's business is lap-over. That is 10% of the business of one month, but now to take it for six months of lap-overs instead of being 10% you have for this one month say 1/6 which would be 1 2/3% of the total.

Q. It changes the divisor and lessens the degree of the lap-over?

A. Yes, sir.

Q. But the lap-over is still there, for any given period?

A. Oh, yes, there is no question about that.

4673 But, as I have said, when this question of lap-overs is applied to six months or one year, the effect is lessened, and if you apply it to one month it may distort the figures very largely.

Q. Suppose you are taking the six months to represent a six year period, would not the same proportion hold good there as if you took one month to represent the six months' period?

In other words, it would be as far from representing the actual facts, with six months representing six years than with one month representing six months, wouldn't it?

A. I suppose that would be true. I never figured an a six years' proposition.

My own personal opinion is, that a year's business should be taken, because there are conditions in each month of the year, and in each portion of the year, that do not exist in other portions of the year.

The six months ending December 31st in the southwest are the most prosperous six months. It is the period of the year when net earnings are greater than in the other six months of the year.

Q. You do not think it would be fair to take the last six months of the year to be representative of the whole twelve months?

A. I think it is not fair to this extent; that the net earnings during the six months will be greater in proportion than they will for the twelve months.

4674 Col. MOORE:

Q. For which six months?

A. For the six months ending December 31, 1907, or any six months ending in December, the net earnings will be greater for the six months ending in June.

So it is unfair to the railroads. The railroad side of the case would make a better showing—and by better showing in this instance I mean a less proportion of net earnings—a better showing for this case—than by using the last six months of the year.

Q. You would not think the six months representative?

A. No, sir, not representative of the year's business.

Q. Would you consider that one year would be sufficiently long a period to wipe out the lap-overs?

A. Well, it is a long enough period to make the amount of lap-overs what we called in the Missouri Case "a negligible quantity".

What I mean to say is, Judge Hill, if the lap-overs are 12 per cent of a month's business they are only one per cent of a year's business: that is the point.

Q. You have objected a good deal in your direct examination to the use of one month as representative of a six months period, or of a years period, as testing state and interstate results:

You do not believe it is fairly representative for that purpose, as I understand you?

A. No, sir, I do not.

Q. I want to read you the testimony the railroads brought
4675 out in this case while Mr. Kimbell was on the stand. Mr. Moore asked these questions and the answers are given by Mr. Kimbell:

"Q. Mr. Kimbell, did the operating officers of the St. Louis Southwestern Railway Company make a test at any time after this litigation was instituted, for the purpose of ascertaining the relative cost of conducting state and interstate transportation? If so, I wish you would state what was done in that respect? A. A test of that kind was made under my direction.

Q. What period did it cover? A. The month of October, 1909. The temporary injunction was granted in St. Paul on September 3, and the month of October was selected for the purpose of making this test, on account of it being the first full month following the injunction. October is rather a heavy month, but for a test of this kind, in my judgment, it fairly represents the general conditions.

Q. Would it represent, fairly, a year's business? A. I should say so. It would represent relatively, the difference between the two classes of traffic."

Do you agree to that?

A. No, sir.

Q. Dr. Nay and Dr. Kimbell do not agree on a proposition of that kind?

A. I understand that Mr. Kimbell took all the trains. He did not take the local trains and deduct from the total.

Q. That is another proposition, Mr. Nay. The proposition now

before you is taking October—that is, taking one month to represent a year's business as fairly representative.

A. I do not like to disagree with my friend Mr. Kimbell, but I will have to in this case.

Q. A little further on he gives reasons and it is only fair that you have before you the reasons he gave.

4676 "Q. Do you think that one month would fairly represent the business of your line for a year? A. I think for the purpose of a test of that kind, determining the relative difference between the two classes of freight, that one month is perhaps as good as another.

Q. Why did you select October? A. As explained it was the first full month after Judge Van Devanter granted the injunction. He granted it in September, September 3rd; we wanted to make this test as soon as possible, so we selected the first full month.

Q. In your judgment, a test of this kind, made for the month of October, would fairly represent the operation for a year, or for a series of years?

A. I should say so.

Q. Well, do you think that would be affected by the fact that this was after the panic, when the normal conditions of affairs was not fairly resumed? A. I don't understand that the month of October was after the panic.

Q. That was when the panic, began? A. Right along in there we began to feel it.

Q. Well, do you think that matters had fairly resumed themselves; so that you could make a fair test of that year? A. I think so. I believe that under almost any conditions, good times or bad, the relative difference between the two classes of freight would travel uniformly. In other words, if we have poor business, it is going to affect both classes of traffic.

Q. And you think that any one month they completely worked up, would fairly represent those conditions? A: I do; yes, sir."

I think that is in full all that Mr. Kimbell has stated on the subject. I wanted to put before you in full all his reasons. Do you agree with him?

A. I do not. I want to say that the doing of this kind of work is a very great burden and, as he stated, Mr. Kimbell used the month of October not because he selected it as a representative month of the year, but because it was the first month after the injunc-

4677 tion was granted.

I want to say further, after I found out what Mr. Kimbell was doing, I attempted the same thing on the Rock Island for the month of November, but we gave it up before we completed it, finding out that so many conditions entered into that sort of a computation that the lgures would be valueless, and we never completed it.

Q. You know Mr. Doddridge?

A. Yes, sir.

Q. He was general manager while you were in the auditing department of the Cotton Belt road?

A. Yes, sir.

Q. He ought to be fairly familiar with the conditions on the Cotton Belt and on the Iron Mountain?

A. Yes, sir.

Q. At page 43 he was asked the following question and made the following answer:

"Q. Do you think that the test of one month's operation would be fairly representative of the entire year?

A. I think in this case that it would be representative as to the relative proportions of the different kinds of business, for the reason that the month of October, 1908, was one of the heaviest months of the year, and considerably above the average 12 months, probably.

The main purpose in making this test was to determine the average relation that one class of business bore to the other and if the business of the road was lighter in a subsequent month the chances would be more than likely in favor that the relative proportions would remain pretty near the same."

Now, what do you say to Mr. Doddridge's opinion on that matter?

4678 A. I say just the same, that personally I do not consider one month as representive of six months or of a year.

Of course, Mr. Kimbell and Mr. Doddridge both are more familiar with the detail conditions on the Cotton Belt than I am.

But, as a general proposition, I feel, after considerable experience of my own, that one month should not be taken to represent a year's business.

Q. Would not Mr. Doddridge be more familiar with the Iron Mountain than you ever were?

A. Yes, sir.

Q. You have served on the Cotton Belt road, as I understand you?

A. Yes, sir. I served 15 years on the Cotton Belt.

Q. But not on the Iron Mountain? You never served on the Iron Mountain?

A. I worked one year for the Iron Mountain, the first railroad work I ever did.

Q. In view of the testimony of these two very distinguished gentlemen, who are so thorough familiar with these two roads, do you think the state is subject to criticism for taking one month's business as representative of six months?

A. That is an embarrassing question, the way you have put it to me, but my judgment is they are.

Q. Notwithstanding Dr. Kimbell and Dr. Doddridge differ with you?

4679 A. You press it so it makes it rather embarrassing to answer.

Q. That is a fact?

A. I think I have stated it before. I would like to agree with everybody but I cannot.

Q. There is another question I think would be fair to ask you, Dr. Nay:

You have spoken a good deal in your testimony of the consistency of our position: What do you think of the consistency of the railroads here, proving by these distinguished witnesses in their case in chief that one month was fairly representative of a year's business; and then proving by an equally distinguished gentleman, who is now on the stand, that in his opinion it is not:

Is not there some degree of inconsistency in that?

A. The testimony shows that the witnesses do not agree in every point. In fact, if witnesses agreed on every point it might look as if they had all been coached and told what to say, in advance.

Q. Certainly. But isn't there an inconsistency in the positions I have stated to you?

A. I don't understand just what you mean. There is a difference of opinion.

Q. The proposition is just this: In making its case in chief the railroads put on these two distinguished gentlemen thoroughly familiar with affairs on those roads and proved by them that
4680 honestly in their judgment one month was representative of six months or of a year's period, or of a series of years, as between state and interstate traffic; and now they put on another distinguished gentleman, honest in his opinion, to prove that is not the case:

Is not that an inconsistency?

A. I think it is a difference of opinion, because I think each man has been consistent throughout.

When I spoke of inconsistency I spoke of the same man using one method in one division of expenses and then switching to a different method for a division of a similar expense.

Now, I do not understand that that is the case in the question you are asking?

Q. I am removing the personal equation and putting it as to the railroads:

Both these gentlemen are entirely consistent and so are you. But here is the railroad proving by one set of gentlemen, who are consistent, who held one view, and then in their rebuttal testimony they are proving by another consistent gentleman another opinion, on the same point in the case.

A. I do not think I should be asked to pass upon the position of the railroad. I think the court can do that.

Q. I think the question rather answers itself, anyway.

Just what are your reasons that using that one month is not fairly representative of an entire year? Why should not one month be representative of an entire year's business?
4681 I am not speaking of any particular month but on the general proposition?

A. One reason is that the lap-overs are not the same one month as compared with another.

As I stated in my testimony, the Rock Island changed its method of computing the operating cost because we found that the lap-overs were so entirely different in one month than what they were in another.

Another reason is that the character of the business is not the same. In the Fall of the year, in the southwest, the cotton traffic moves. That is, when cotton predominates.

Q. I asked you not to take any one month. I asked you just on the general proposition.

A. I said in the Fall of the year. I do not think I mentioned October.

Q. Proceed.

A. In the summer months, April or May, of the spring months, are the two lightest months of the year. The traffic is lighter in those months than in any other.

Then, again, during the summer months, when the traffic is light, it is very frequently the case that that is when the very heaviest maintenance work is done.

At certain seasons of the year the passenger business is heavier than at other seasons.

It is frequently the case and I think is the result of good management, to repair the passenger cars and incur expense of that
4682 character when the passenger traffic is the lightest.

So we have all those combinations, certain seasons when the traffic is heavy and other seasons when it is light. The character of the traffic being different in different seasons.

And I am of the opinion that the only way to get the true result is to take 12 months in succession, which will reflect the various conditions that exist during the year.

Q. Do not all those various things you have mentioned practically affect state and interstate traffic alike?

A. Well, they might. But owing to the difficulty of separating expenses, the impossibility of actually separating the expenses between state and interstate, it is hard to say, whether they affect them alike or not.

For example, in 1907, was when we had the biggest blockade on the Rock Island that we have ever had in my recollection.

The great trouble then was with the grain; grain which was moving from Nebraska and Kansas into Little Rock and through Little Rock and beyond. The great trouble we had was with the grain, at that time. That was the thing that was delayed more than anything else. And that was all interstate business.

Q. That was an abnormal condition you are speaking of now?

A. Yes, sir, I am saying it was the greatest delay we ever had.

4683 Q. That delayed other business?

A. Yes, sir.

Q. It delayed the local business?

A. Oh, yes.

Q. Would it not have a corresponding effect on all business?

A. No, sir, I do not think it would have the same effect on the state business.

The movement of state business is short, as is evidenced by the short average haul. It would not be subject to all the delays that affect interstate business. That would be my judgment.

Q. That is the time when the short haul would be cheaper than the long haul, wouldn't it?

A. I am not sure about that.

The relation between the two would be affected by these conditions.

Q. The cost of the long haul would go up and relatively the cost of the short haul would go down, under such conditions?

A. Relatively, yes.

Q. Did you not recently, in a hearing before the Examiner for the Interstate Commerce Commission, present one month as a fair index of the year's business of your road?

A. No, sir.

Q. Did you not present one month as a fair index, and add to that the revenue for three weeks succeeding that one month?

A. That made seven weeks.

4684 Q. But your total expense and income was for just one month, wasn't it, as shown in that statement?

A. Yes, sir. If you will read my testimony, Judge Hill, you will find I stated there that that was all we had and I gave the last week we had.

That was in the early part of September, before we had even the fourth week of August, and we gave them everything we had.

They asked me then, might not the earnings be a great deal more than those seven weeks would indicate, and I said "yes, they might." I said also "They might be a good deal less." I said "This is all the evidence we have got up to this time."

I have never selected one month or seven weeks, where more time was available, Judge Hill.

Q. Here is the point, isn't it a fact that you selected one month completely worked up, and supplemented that with three weeks revenue and presented that as a fair index of a year's business.

A. No, sir, I presented that as the best idnex we had.

Q. Didn't you say it was a fair index?

Col. MOORE: Have you his evidence there, Judge Hill?

Judge HILL: Yes, I have it here.

Mr. NAY: If you have it there, please read it.

Judge HILL: I will read from your evidence given before the Examiner for the Interstate Commerce Commission at Chicago recently, as shown at page 849: This was in regard to

4685 Exhibit "C":

"Q. Will you please state what is shown by this exhibit?

A. This exhibit is a copy of the report for the month of July to the Interstate Commerce Commission, which was mailed to that body yesterday. It shows the operating revenues and operating expenses and taxes and outside operatings for the month of July, 1910, compared with July 1909. It shows that the freight revenues for July, 1910, decreased $110,620.06 compared with July 1909. It shows that the operating expenses during the same month increased $281,454.03. It shows that the deficit from out-side operations decreased $491.15. It shows that taxes increased $42,959.32 and that the

operating income for July, 1910, compared with July, 1909, decreased 378,901.68.

And to continue the history down to the latest date we have, which is our estimated gross earnings for the three weeks ended August 21st, there is a decrease for those three weeks in freight revenues of $243,272, which makes the total decrease for this fiscal year, for the seven weeks in this fiscal year of which we have any record, as to the freight revenues, of approximately $355,000. It also might be well to point out that the report shows that the principal increase in operating expenses is in transportation expenses, and not in maintenance of way where Mr. Melcher testified he would like to spend the money.

Q. Mr. Nay, using the exhibit last introduced in connection also with your estimate for August, for a certain week in August, using this as a basis, what do you think is the outlook for the fiscal year 1910-1911?"

Then you gave an answer about that which is hardly pertinent to our question in this case, unless you wish to hear all of that read.

You remember there was quite a discussion about your views in there.

Then you were questioned by Mr. Thorne (page 908):

"Mr. THORNE: Your volume of business has been increasing as a general thing from year to year during the past ten years, has it not?

A. No, sir—during the past ten years, yes, sir; but as
4686 stated yesterday in my direct examination, the volume of business decreased for the month of July, and has continued to decrease for the three weeks in August concerning which we have definite information, and based on that,——

Q. What exhibit is that shown on?

A. That was stated on Exhibit 6, and also stated in connection with my direct testimony concerning Exhibit No. 6.

Q. Is it your opinion that is a fair index, that increase for one month is a fair index of the volume of traffic or earnings or expenses for the year as to whether it is greater or less than the prior year?

A. I have no other basis to go on than past experience by which to judge the future.

Q. And you would say that that was a fair index, whether one month is higher or lower than the same month for the prior year, is a fair index as to what the earnings or expenses would be for the entire year?

A. This is more than one month, begging your pardon.

Q. And two weeks, then.

A. One month and three weeks.

Q. All right, one month and three weeks. Do you think that is a fair index for the year as to whether it should be greater or less?

A. As I said before, it is the only index that I have before me.

Q. Did you ever make any effort to find out whether that was a fair index by examination of the same item in prior yeares.

A. I do not understand just what you mean.

Q. Did you ever make any effort to ascertain whether that did

prove to be a good index as to whether the earnings increased or decreased for the year?

A. Yes, sir, providing conditions remain the same. Of course, Mr. Examiner, no one can foretell the conditions."

Then you go into a discussion.

A. Right there is where I made the explanation. You will notice I said there:

4687 I will continue reading:

"Three years ago, in 1907, at this period of the year I would have stated, if I had been asked the question that we would have had a very large increase in revenue for the year ended June 30, 1908, but when the panic times came in 1907 the revenue went to pieces and that would have destroyed my judgment. Now good times may come, or worse times may come. The only information I can give is based on the experience up to the latest available data.

Q. I am going to ask you Mr. Nay, to read into the record at this time the net operating revenue of the Chicago, Rock Island and Pacific Railway Company for the months of July, 1907, to June 1908, inclusive, as shown in the reports you have given to the Commission.

I can say this, I do not want to burden the record with a great mass of statistical reports, but this will help me in my cross examination at this particular point."

Then you take up and read into the record a lot of data which I will omit. Do you remember that?

A. Yes, sir.

Q. Further on the following occurs:

"Q. Now, Mr. Nay, considering the fluctuations you have stated there, do you still think that the net operating revenue, whether it is higher or lower for any given month is any index for the entire year?

A. Yes, sir."

A. You notice that question is "any index" and I said "yes." But I did not say it was a fair index. I qualified every answer, all the way through. There is not a single answer where I say that it was a fair index. I said I had given every bit of information I had, up to the very minute, and I gave them a copy of the report sent to the Interstate Commerce Commission, which had been sent to them just the day before. I gave them a copy of the esti-

4688 mated weekly expense which we get out every week and I gave them the latest information we had.

I qualified that by further saying "Good times may come so the earnings may be more than I now expect, and bad times may come and the earnings may be a great deal less."

I gave them that as the best and latest information we had, up to that minute.

Certainly if six months or twelve months had been available I would have given them the six months or the twelve months.

Q. You put that exhibit in there believing it had value as a fair index, did you?

A. No, sir, not as a fair index.

The last question asked me was "is it any index". And I said "Yes, this is any index".

Q. You put it in as any index but not as representative at all.

A. I gave them the earnings and the operating expenses for thirteen years, beginning with 1888 and ending with June 30, 1910.

These had been compiled during the month of August, and then before the trial came on on September 2nd—in the meantime I had sent forward the report for the month of July on the first day of September—and I supplemented that thirteen years' statement with the very latest information we had; and submitted it for what it was worth, to show the trend of the earnings, at the very latest period.

Q. And gave your opinion, and judgment, in your testimony as to the future based upon that seven weeks' exhibit?

4689 A. Yes, sir, qualified by the statement that better times might come and it would be increased; or worse times might come and the showing would be worse.

Q. Has not the Interstate Commerce Commission in some of its hearings indicated that for a year's business they wanted two months, and indicated those months to be September and March?

Col. MOORE: For what purpose?

Do you mean the volume of business or the profit or what?

Judge HILL: I do not know the detail of that but I think Mr. Kay does.

A. I can explain that. The proposed increase in rates would yield a certain amount of increased revenue; and in order to show an approximation of the increase in the amount of revenue that would be created by these increased rates, the Interstate Commorce Commission designated September, 1909, and March, 1910, as the months that should be taken to compute this one item of increase in freight revenue that would be produced by the proposed rates as compared with the rates that were actually in existence during these two months.

I have talked with one of the representatives—I forget now just who it was, but I think it was Mr. Lutz who is Assistant to Professor Adams—and he picked those out as being perhaps average months; not being the largest months nor the smallest months.

4690 Q. Would there be any difference in principle in taking one month as an index of six months and taking two months as an index of twelve months?

A. No, sir, but understand those two months were taken as an approximation of simply the one item of increased revenue.

The exhibits that were presented there representing the earnings and operating expenses, taxes and so on, were all for a period of years, from five years up to thirteen; and the exhibits that are being compiled by the Interstate Commerce Commission (proofs of which I have seen) in connection with this rate case, covered a period of ten years from 1901 to 1910 inclusive.

Q. And you would not think it would be safe to take one month

as representative of six months; or two months as representative of twelve months, to get at the fair representation of the whole business of a railroad over a series of years?

A. Not for any final determination where accuracy was required. For an approximation where special accuracy was not needed, two months or one month might be taken.

Q. While I have this in mind—it is a little diversion but I believe I will take it up now—

I notice in your testimony there before the Master you stated you had a formula for dividing expenses between freight and passenger which had been in use on your road for some eight or ten years, I believe.

4691 I wish you would state just what that formula is.

A. I could not state that offhand. It comprises several pages.

Q. Give us the substance of it, the principle involved in it.

Col. MOORE: If you are going to try to get anything of that sort in the record you should get it in correctly.

Judge HILL: I think Mr. Nay can give it correctly. I do not know that the detail would be important but I want to get the important details, that he considers important.

Col. MOORE: A man trying to put in a matter that covers several pages might omit some detail that would be very important. I have no objection to it being put in in its entirety.

A. I was going to suggest that we have a formula in print, and I could send a printed copy to Judge Moore to be embodied in the record.

Judge HILL: I shall be glad to have it but in the meantime for the purpose of this examination, I would like to have you explain the general propositions involved in it?

A. I would rather not do that unless you insist, because I have found out that upon the witness stand if a person's recollection of a detailed formula like that, is not accurate and if he omits something, a great deal is made of it.

Q. I want simply the general principle.

4692 If you have been operating under a formula for dividing freight and passenger for a great many years, you are familiar with the general principles involved in that and you have discussed at some length in your direct examination the general principles for dividing those.

I do not care for the details but I wish you would give us the general principles.

A. The general principles are these:

In the first place all items that can be assigned directly to either passenger or freight traffic are so assigned. That is to say, the repairs to passenger cars are assigned to passenger traffic; and repairs to freight cars are assigned to freight traffic.

The expenses of passenger traffic offices, like the general passenger agent and the division passenger agent and the soliciting passenger agents are all assigned to passenger traffic.

Similar employes in connection with freight departments are assigned to freight traffic.

The wages of station men at freight stations are assigned to freight traffic, and those at passenger stations are assigned to passenger traffic.

The wages of crews on passenger trains are assigned to passenger traffic; and those on freight trains are assigned to freight traffic.

Loss and damage to baggage, goes to passenger traffic; and loss and damage to freight goes to freight traffic.

4693 All the way through the items that definitely represent passenger or freight expenses are so assigned.

Then we go back and take up the items that cannot be definitely assigned, and make an approximation of the items of that character on different bases.

In some cases it is on the basis of train mileage; in some cases on the basis of engine mileage; in some cases such as for yard expenses, we get an approximation which is the result of the switch engine mileage, from our operating officials, as to the relative amount of passenger and freight switching.

I think roundhouse expenses are divided on the basis of the engines housed, engines in passenger service and engines in freight service.

But these are the principles: We endeavor to apply to our common expenses (and by common I mean those that cannot be definitely assigned as between freight and passenger) the thing that seems to have the closest relation to the expense.

Q. You take the factor which in your judgment most nearly approximates the actual conditions?

A. Yes, sir.

Q. Take maintenance of way, what factor do you use there to divide between passenger and freight?

A. We have been using—I am speaking now of the formula we use for our operating statistics which we furnish to the Interstate Commerce Commission—we have been using the passenger and freight train mileage.

4694 Q. You think that a fair approximation of maintenance of way expenses as between freight and passenger?

A. Well, it is the fairest we have been able to find, which was available at the time we compiled those figures.

Our operating men say that the greater speed of the passenger trains offsets the greater weight of the freight trains. So that it is fair to assume the passenger train mile may be considered the same as the freight train mile.

Q. For that class of expense, between those two rather radically different kinds of traffic, you consider the train unit?

A. Yes, sir, and I would like to say this: that these statistics are compiled for comparative purposes. They do not purport to cover the actual separation between freight and passenger of these common expenses. But by using the same unit from month to month we are able to make comparisons of one month with another. That

is the same basis of apportionment. And those figures are compiled purely for comparative purposes.

Q. I would infer from that you do not regard it as producing actual results or very close to actual results—I am referring to maintenance of way and so on.

A. We do not claim they produce actual results but we claim they produce the fairest results for the purposes of comparison, that we are able to compile.

Q. Would a division of maintenance of way expense between freight and passenger on a train mileage basis be fairly ac-
4695 curate?

A. From the testimony I have heard from operating men I think it would be as accurate as anything that is available at the time these statements are compiled.

Q. Did you make your statements to the Interstate Commerce Commission in these various exhibits based on that formula.

A. Yes, sir.

Q. Now, right in that connection, I want to ask you: In the numerous exhibits you filed in that case which I believe was a case where you were seeking to get an advance of interstate rates granted by the Interstate Commerce Commission—that was the purpose of that hearing, was it not?

A. Yes, sir.

Q. Did you make any separation of state and interstate business?

A. No, sir.

Q. Your system runs into ten or twelve states, does it not?

A. Fourteen states. That is, the company, the C. R. I. & P. runs only into twelve states. The lines in New Mexico and Texas are under separate corporations.

Q. The one before that hearing operated in twelve states?

A. Yes, sir.

Q. You had no separation of state and interstate, or income and expenses, in those statistics you presented to the Interstate Commerce Commission, showing the necessity for an increase of your rates?

4696 A. No, sir. The reason for that was because it was a human impossibility, Judge Hill. It would have taken a force of say 100 or more men two or three years to have compiled that information for a representative period for the twelve different states—the entire business of the company.

I stated that in my testimony at Chicago, that the compilation for one state was a small matter as compared with the compilation for the twelve states.

We simply gave the best we had. In the length of time we had to prepare the testimony it was impossible to compile state and interstate information for anything like a representative period.

Q. You have separated in some ways your state and interstate business in quite a number of these states, have you not, where you have rate cases pending?

A. We have in Arkansas, Oklahoma and Nebraska.

We have some started in Missouri but they were two or three years old. We did not continue the separation after the case was closed.

Q. Does this railroad run into Minnesota?

A. We were not in the Minnesota case. We abided by the decision as to the others. I prepared no statements for that case.

Q. You prepared no separation of state or interstate in Minnesota?

A. Not in freight.

Q. Did you in passenger?

A. Yes, sir.

4697 Q. As I understand your method of preparing separate statements for state and interstate business, in any given state, under the revenue theory (which you adhere to) you show a great deal increased cost of operation of the state over the interstate business, do you not—per ton per mile, I mean?

A. By separation of state and interstate business you mean state and interstate expenses, I presume?

Q. Yes.

A. Yes, sir, it shows an increased cost per ton mile of state over interstate.

Q. I believe you testified in that case, speaking roundly, that your state business was about 20% of your whole business, isn't that true?

A. That was a guess pure and simple, based on these four states we had prepared statements for.

Q. That was your best judgment?

A. Yes, sir. The word "guess" came up in that case and I looked it up in Webster and found the definition about as follows: it is a tentative conclusion based on experience without detailed information.

Q. And that was your "guess" that the Rock Island interstate traffic in twelve states based on the statement for four states, is 20% of the whole?

A. Yes, sir, and it might prove to be not over 10 or 12 per cent or it might be 30 per cent.

Q. When you presented your total expenses and total revenue for twelve states and ignored the much greater expense of con-
4698 ducting intrastate business than interstate business, and you were presenting these figures to the Interstate Commerce Commission looking toward an increase in interstate rates, do you think you were entirely fair in ignoring this proposition?

Col. MOORE: We are not trying interstate rates in this case.

Judge HILL: No, but we are trying the intrastate.

Col. MOORE: Whether it is fair or unfair in that case is not material in this case.

Judge HILL: I think it a pretty fair test. I think that is a proper question I asked the witness.

Col. MOORE: Of course, I am objecting to all of this testimony as irrelevant.

Previous question read.

A. As I recall it, this proposition was not entirely ignored because the very question you have referred to, and which led me to "guess"

at 20%, was a question concerning the separation of state and interstate traffic and I said candidly on the stand that the reason why it was not done, was because of the amount of work involved prohibited it being done within the length of time we had.

But I do think it is entirely fair to present all the information that we had. And, furthermore, I had the privilege of having seen proofs of certain statements that are being compiled by the Interstate Commerce Commission employés themselves, and they are
4699 making no separation and are attempting to make no separation and have not called for any separation.

But this case was tried, not as to any individual rates, that was determined in advance, the Examiner said that the rates on coal would not be investigated separately or the rates on grain or this, that or the other thing, but this case was tried on the broad principle that the railroads needed more money than they had.

And when I showed that the total operating revenue for the year ending June 30, 1910, the last of a series of thirteen years, after paying operating expenses, taxes and so on, left a return of only 3.77%, on the book value of the property, which was more than one hundred million less than the operating officers said the actual value was, I felt it was fair to ask for an increased revenue on that showing.

That with the small amount of intrastate business, even allowing for the increase expense, the return would not be increased above what might be termed "compensatory"; or, rather, would not be increased to an undue return.

Q. Let us see about that, Mr. Nay:

If your contentions were true, that it costs three to seven times more to do the state freight business than the interstate; and that was true in twelve states, representing 20% of your business: and now if you had charged off say even three times your expense of that 20%, three times greater to the state business—would it not have made a material difference in the general result which you showed to the Interstate Commerce Commission?

4700 A. I don't think so.

Q. Is not that a matter of mathematics.

If you take 20% of all your business and increase the expense of that by three times, thereby relieving the expense of the interstate corresponding, and run that into twelve states: would not that make a great deal of difference?

A. Do you maintain that the cost of intrastate business is three times the cost of interstate, on the revenue basis?

Q. I don't maintain that but a great many of the railroad witnesses have maintained it was three to eight times. Usually they are speaking of it on a ton mile basis but they generally put it at twice or three times on the revenue basis.

A. Three times would be putting it higher than the railroad men do on the revenue basis.

Q. They put it at three to seven?

A. On the revenue basis?

Q. No, sir, on the tonnage. And two to four times on the revenue basis.

That is about the average, isn't it, Col. Moore?

Col. MOORE: About that.

Judge HILL: I take it in that difference they are saying that the state revenue is double that of interstate.

Reflect upon that a moment and see if that would not make a material difference, if you had adopted the position taken by the railroad men, and which you recognize in your testimony as a material factor; although you have not mentioned any particu-
4701 lar figures; but accepting the opinion of the general manager, the vice-president and so on, that it was three to four times on the revenue basis and three to seven times on the ton mile basis?

A. Well, my own judgment is, it would not have made a material difference in our case, because while I do not recall the exact book value of our property, it was a little less than three hundred million—say $295,000,000.

To make one per cent of that would require $2,950,000 difference, and we needed even to go up to six per cent (which I understand is the minimum amount the courts figure on as a fair return) we needed more than two per cent or in round figures six million dollars more money. And I am certain that the difference in figuring—well, I could not determine it without knowing the exact figures—would never have made that difference of six million in the interstate results.

Q. Probably it would not have made that difference but would not it have made a difference?

A. It would have made a difference.

Q. And a very considerable difference, would it not?

A. I do not think it would have made what could be termed a very considerable difference.

Because the interstate revenue is so very much greater than the state revenue.

Take it in Arkansas, for the six months ending December 31, 1909 the statement which I compiled for Mr. Wharton shows that the intrastate was 12.9% of the total state and interstate freight revenue.

4702 Q. But, Mr. Nay, you are taking the revenue basis (of which you are an advocate) you would say you would set aside 20% of your property and assign it to state business?

A. On the theory that 20%—well, no, 20% of the freight proportion of the property. We are talking about freight.

Q. Yes, we are talking about freight.

If this ran into all of it, it would be the whole, but speaking of freight it would be 20% of the property devoted to freight purposes?

A. Yes, sir.

Q. When you set aside 20% of the value of the property and are seeking a return on the other 80%, through the rulings of the Interstate Commerce Commission; and this 20% which is set aside would reduce—take the expenses and multiply them by three on that and

deduct that from your aggregate expenses of the 80%, do you think that would make a considerable difference in the showing?

A. It would make a difference but as to how much difference would have to be determined by actual figures.

Apparently in this case the other side were satisfied with the explanation, because they have never called upon us for any figures or even any approximate figures such as you have asked for recently.

Q. Possibly these gentlemen do not know it costs this extreme amount for doing the state business. They are dealing with
4703 interstate. It seems you did not inform them in this hearing about the cost of this state business. You gave them no information in this hearing as to the extra cost of state business, did you?

A. I don't know that I have ever testified as to the amount of extra cost. The operating officials are the ones who testified as to the amount of extra cost of state over interstate.

Q. You do not take the judgment of the operating officials as to the extra cost of intrastate, when you were preparing those figures?

A. We had no figures to apply it to. There was no necessity for getting extra cost when we had no figures to which to apply the extra cost.

As I say, the obtaining of those figures was prohibited in the time we had. It would take two or three years with a large force of men, to work up representative figures as to the cost of state and interstate traffic for the Rock Island road.

Q. You made some statements about October being a congested month, of a congested period; was not all the last six months of 1907 a congested period, more or less?

A. I think there was more or less congestion until the slump came about the later part of October or about the first of November. I do not think there was much congestion, after that time.

4704 Q. I think some of these operating men have testified that it took quite a while for that panic to affect that freight traffic.

A. Of course, they would know better than I as to that.

Q. Things were pretty well started before that panic came on?

A. How is that?

Q. The movement was pretty well started, contracts made and freight on the way before that panic came on, I mean?

A. I am not posted on that. But all I know is we were running to our capacity and having complaints of delay, until the panic came; and then the complaints ceased. The difficulty then was to get the empty cars home.

Q. Would you consider the last half of 1907 a normal period of railroad operation?

A. As I said a while ago, I would not consider the last half of any year as a representative period.

Q. This is a different question: would it be a normal period? I understand your former answer but I think there is a difference between that proposition and this one.

A. Do you mean by "normal" the ordinary conditions that exist from month to month and year to year?

Q. Say the last half of a series of years: I understand that point made about using the last half of any year but I am testing the last half of that year with a series of year- and I ask you preceding
4705 that if that would be normal?

A. I should hardly say normal because I think, if my recollection serves me aright, it is the half year in which the largest business of the history of the country occurred.

I think notwithstanding the slump that came in the first of November or the latter part of October and continued for some time, that the business hauled during those six months was heavier than during any six months in the previous history of railroading.

For that reason I do not think it would be just normal.

Q. If there is a congested condition of affairs in one month, or in six months, where would you find the expenses that represent that congested condition reflected—in what accounts?

A. I hardly think I would be competent to testify on that.

Q. You handle all the accounts, do you not?

A. Yes, sir. But I have not made any study as to which accounts are affected by congestion.

There is one that occurs to me now, that has been impressed upon us, and that is, loss and damage, freight; that actually occurs during that month. Frequently it is settled later.

Of course, where there is a congestion there is a delay to freight and claims made on account of perishable freight spoiling.

For instance, we had a lot of wheat heat in the cars and
4706 spoilt and a lot of corn did the same thing; during that period on the Rock Island. And the loss and damage account—and I am referring to loss and damage which actually occurred during that period, and which would be settled later, is one of the accounts.

Q. Those would be settled in later months—or probably later years, isn't that true?

A. Well, that would depend, of course, upon the promptness with which freight claims are settled. We are trying to settle ours as promptly as we can.

Q. I am not intending to make any criticism on your road in that respect. I think it is better than some others I know of. But there is a good deal of delay in the settlement of freight claims, isn't there; and a good deal of litigation over them: isn't that true?

A. Yes, sir, that is; and it is not always the fault of the railroad company. Claims are presented for a great deal more than is actually due and the railroads cannot accede to all those things.

Q. It is one of those things you cannot forecast, isn't it?

A. Yes, sir.

Q. You criticised the use of these October figures, I believe, in this particular regard: that these claims that would be paid in October would not be reflective of the damages that occurred in October: isn't that true of any period you would take? Say a six months' period, the same thing would be true, would it not?

4707 A. Yes, sir. It is just like the lap-overs, Judge Hill; the effect of that is minimized the longer the period you take—

or, rather, reduced. This is minimized by taking the longest period and reduced by taking the longer period.

In the six months' period a great many of the claims caused by damages occurring in those six months would be paid during those six months and charged to that account. While I think very few of the damages occurring in any one month are paid for in time to be charged off in the accounts of that month.

Q. But you take a six months' period and take loss and damage paid during that month, it would not represent the result of expense of operation in that account for those six months?

A. No, sir, but would more nearly represent it than in any one month.

Q. That is unquestionably true, and would largely depend upon the promptness with which the claim department investigated and settled claims?

A. Yes, sir.

Q. I do not recall whether you discussed the passenger side of that proposition, but I assume the same principle would apply to that, would it not?

A. Yes, sir, as to claims for personal injuries to passengers. That is what you refer to?

Q. Yes, the claims for personal injuries—the corresponding accounts to this in freight.

A. Yes, sir, they would be subject to exactly the same delay.

4708 Q. It is likely there would be more delay in regard to personal injuries than in regard to freight claims: It is a matter of more litigation, more protracted, is it not?

A. Well, I would not say it was more, Judge Hill.

We have many personal injury cases, and one case might be drawn out and become the subject of a good deal of notoriety; and perhaps that one case might be considered representative; while there are hundreds of cases that are settled promptly, which would be forgotten, and not thought of.

I do not believe personal injuries, are as a rule delayed more than the freight claims.

Q. There is that element of delay in both of them?

A. Yes, sir.

Q. And that would reach through any period and would depend upon the length of the period as to how far it departed from actual conditions: that is correct, is it not?

A. Yes, sir.

Q. That would not be affected either by the method of dividing those expenses, would it?

A. You mean either on a revenue basis or some other basis?

Q. Some other basis.

A. No, sir.

Q. That criticism would be equally applicable to any basis that would be used for dividing those between state and interstate?

4709 A. Yes, sir. If the revenue basis was applied to one month's figures it would be subject to the same criticism as any other basis.

Q. It is practically the same thing about maintenance of way: you discussed that in criticising the division of maintenance of way expenses on the car mile basis and stated, as I recall it, that the car mileage would have no relation to the wear on the rail, because that may have occurred as far back as twenty or thirty years before; and for ties seven years before, and so on.

That same criticism can be applied to any basis of division of maintenance of way expenses between state and interstate, can it not?

A. Oh, yes. That is to say, that criticism would be reduced the longer the period taken.

Q. I am not speaking of the length of the period. I am speaking of that element. As I recall your testimony, you were criticising the division of expenses on a car mile basis and stated that the car mileage during those months had no proper relation to the wear on the rails and ties and so on:

Is not that criticism equally applicable to the revenue theory or the ton mile theory or any other theory for dividing those expenses between state and interstate?

A. I don't think it is equally applicable to the revenue theory.

4710 I did not quite understand your question at first.

I think the expenses are incurred during the period under consideration and must be paid for out of the revenue of that period. It is not paid for out of the revenue that accrued in previous years, because the revenue that was received in previous years is reflected in the accumulated profit and loss account; and the revenue received during the current year is reflected in the current income account, to which these items must be charged as operating expenses. They must be taken out of the revenue for the current year, and, therefore, I do not think the criticism applies with equal force to the revenue theory.

Q. But the revenue that is earned in these six months has nothing to do with the rotting of ties and the wearing out of rails and flood damages, and all those things, has it?

A. Nothing to do with the rotting, but it must be used to renew them.

Q. That is the source of the money to renew them.

But the question is now, does this revenue during this given six months represent the wear on that rail, to use that as an illustration?

A. No, sir, it does not and it is not the reason that the revenue theory is used.

Col. MOORE:

Q. What is the reason?

A. The reason that the revenue theory is applicable to maintenance of way expenses is that the expenses must be met out of this revenue.

4711 That cannot be charged back to profit and loss, where the accumulated revenue is carried.

Q. It is using the revenue of one period to pay for the wear of a previous period, is it not?

A. Yes, sir, and that is required by the Interstate Commerce Commission rules.

Q. I am not discussing the propriety of it, Mr. Nay. I am merely discussing the fact, whether the revenue would represent the injury any more than the car mile would represent that injury.

A. No, sir, it does not. But the expense must be met out of this revenue.

Q. Why, certainly, I understand that.

Speaking of the car miles as the unit for measuring the expense of maintenance of way between local and through trains, isn't that a unit that is used in common practice of railroads where they have joint tracks, to determine the method of apportioning the expense of those joint tracks between the given roads?

A. That is one of the methods that is used.

Q. It is very commonly used, Mr. Nay, isn't it?

A. There are three methods used, Judge Hill:

There is the train mile, the car mile and the wheel mile. And in some cases an arbitrary basis of one-half or one-third and two-thirds; and in other cases the revenue basis is used. All of those units are used.

4712 Q. I understand from the operating men, like Mr. Gray, that the car mile and the wheelage bases are synonymous; that the car mile basis is a term that originated from the old method of counting the wheels but now they call it the car mile basis:

Is that your understanding?

A. Yes, sir, that is done largely to simplify the proposition.

But we are still using wheel miles in many contracts today. And the latest contract made was on the revenue basis.

Q. In one of these states where you have rate litigation?

A. No, sir, in New Mexico where we have never had any rate litigation.

Q. Where you are getting ready for it?

A. No, sir, we have never had any trouble down there or any pleasure of this kind.

Q. I believe these learned doctors who have disagreed upon some other proposition on this Iron Mountain and Cotton Belt Railroads, have agreed upon the car mile basis for paying maintenance of way expenses on the joint track that the Iron Mountain uses with the Cotton Belt:

My point is this: it is a common basis used among railroads in their own affairs, is it not?

A. Yes, sir. But I wanted to make it clear, Judge Hill, that it was not the only basis but that there were these other bases, too.

4713 Q. Didn't you state there was practically no difference so far as freight cars are concerned, between the wheelage basis and the car mile basis?

A. In these contracts there is no difference made.

Q. As a matter of fact, is there any difference of any moment?

A. I do not think there is any great difference, no, sir.

Q. That would be one of these "negligible quantities" we stop at?

A. Yes, sir, because there is really only about 10% of the expense that is at all affected by car miles or wheel mileage.

Q. I believe the doctors have disagreed on that from 75 to 90%.

A. Yes, sir.

Q. While talking about wheels—it is a little digression but I will ask you this question:

Did you ever ascertain about the relative weight of an average locomotive, loaded with coal and water; and the average freight car, loaded with the average load; and find out that the locomotive was about 2½ times the weight of the loaded car?

A. I think I have, offhand. And then, subsequently—I think it was in the Nebraska rate case we made a computation. I intended to bring with me our roster, which shows the weight of the locomotive and cars, but I forgot to bring it. I do not recall what that is. I do not know that I have anything here that would show.

4714 Q. Did you testify in that case it was about 2½ times?

A. No, sir, I ascertained that in preparing some data for cross examination of the state's witnesses. (After examining paper) No, sir, I have not anything here that would give that.

I have the average weight of a Rock Island locomotive on the drivers, 74 tons.

I have not the average tare weight of our freight cars, but I think they will average not to exceed 20 tons.

Of course the average weight on the drivers would not include the tender. I think it would be a much greater disparity in weight if it were looked up.

Q. I just wanted to know and was under the impression you had it?

A. I haven't it here.

Q. You refer to the lighter loading of the cars in the local train, making less difference in the repairs of maintenance of way on that acount; that would be, if an error, an error against the local train in this case, would it not?

A. Yes, sir.

Q. Now, Mr. Nay, I want to call your attention to your testimony at 436 of the record. I wish you would turn to it. I do not understand it. You were asked this question:

"Q. Referring to the allowance of 50% for station switching in this connection, do you think it would be proper to charge as large a proportion of it to interstate business, that is, business com-

4715 ing into and going out of the state from another state, as you would charge to intrastate?

A. No, sir, I would not. That is to say I think a greater portion of that charge if we could ascertain what that is, should go to state business than to interstate."

If you look at that exhibit I think you will find that the station charge is measured between local and through and not between state and interstate: is not a fact?

A. Yes, sir.

Q. I confess I do not understand your answer there at page 436.

Col. MOORE: If you allow me I can explain exactly what it is.
Judge HILL: He made the answer there.

A. The question is:
"Do you think it would be proper to charge as large a proportion of it to interstate business, that is, business coming into and going out of the state from another state as to intrastate business"——
and I said:
"No, sir, it would not."

Col. MOORE: That is the 50% allowed to the cost of local trains?
Judge HILL: You see the 50% is not 50% for state or interstate but 50% allowed to the local train?

A. Yes, sir. But my answer still answers the question asked me.
Q. How does it answer the question?
4716 A. The question was, would it charge as much to interstate business as to intrastate and I said, no.
Q. They are not charging it to interstate or intrastate; they are charging it to local and through; they are charging it to the switching of that local train.
A. Yes, sir.

Col. MOORE: Read back there and see the context.

Judge HILL: I did not so understand it in this record.
A. That is the reason I answered the question as I did. The question asked between state and interstate and not local and through.

Judge HILL:

Q. And the allowance to which you refer applied to local and through and not between state and interstate?
The whole point is this: you have not made your position clear to my mind. If that answer has done it, it is due to my dullness and I would like you to explain just what your view is upon that subject.
A. I think I understand the point of your question now. That is, that this 50% that is added to the local trains adds that much to the state and interstate traffic alike that is carried on the local trains.
Q. Yes.
A. And Judge Moore asked me as follows:
"Referring to the allowance of 50% for station switching in this connection, do you think it would be proper to charge as large a proportion of it to interstate business; that is, business coming into and going out of the state from another state, as you would charge to intrastate business." And I said: "No, sir."
4717 That is to say, I think a greater portion of that charge, if we could ascertain what that is, should go to state business than to interstate business.
While this addition of the 50% to the local adds it to the state and interstate alike.
Q. And you do not think that is correct?
A. No, sir.
Q. If I recall correctly the testimony of the numerous operating

men here it is that freight after it gets on the local train, whether state or interstate, is handled exactly alike.

What would be the difference in the handling of the two classes of trains, in the switching of the interstate, on the local they would be handled alike?

A. I think undoubtedly they refer to the direct labor and expenses that it receives and incurs en route.

Q. The testimony will show it is a good deal broader than that. But that is the point I wish to get from you, whether you disagree with that view, and that is the point to which you were referring?

Col. MOORE: I cannot entirely agree with your assumption as to what the operating men have testified to. I understand they testified that all conditions being the same, there would be no difference in the handling of the two classes of freight on the local trains.

But all of them have testified that the conditions are not
4718 the same and everyone of them have testified that the larger part of the expense of the local trains grew out of the difference in the handling of state and interstate freight, and assumed that the larger part of it should be charged to state freight. On account of the difference in haul and many other matters of that sort.

Judge HILL: My recollection of the testimony of Mr. Whitenton—I am speaking from memory as I have not it before me, was that he said after freight gets on the local trains there is no difference in it.

Take the local train from Fort Smith that has five cars of interstate freight that came in from St. Louis, say, to be distributed upon that road; and they have five cars on there to be loaded on the industrial tracks, or from the Rock Island: the handling of that they say would be the same, after it gets on the local train.

That is the point on which I wish to get your views.

Col. MOORE: The contention is there would be no difference, they say.

Judge HILL: There would be a difference, of course, but my point is to get how Mr. Nay looks at it.

A. My understanding is that this allowance we are speaking of is an allowance for extra switching at local stations, and not the handling en route.

That is why I said a while ago that these operating men who spoke of the expenses being the same, meant the expense en route.

4719 This extra allowance for station expenses by being applied to both state and interstate alike, and then subsequently divided on a ton mile basis, does not in my judgment assign enough to the intrastate business, because each intrastate shipment has two terminals within the state and is handled at two stations; while an interstate shipment has this terminal switching at only one point in the state.

Q. That is taken care of in another movement, the two terminals proposition:

But we are now down to your interstate freight being put on the local train?

A. I do not understand this 50% which it is said is added for local station switching and not for the hauling between terminals.

That station switching is supposed to represent the additional repairs under the head of maintenance of way, that will be caused by the local switching.

The point I make is, that I claim there is more local switching per ton mile to state shipments than there are to interstate shipments.

Q. But not in the same train, is there?

Col. MOORE: You mean maintenance of equipment, don't you? You said maintenance of way.

A. No, sir, I mean under maintenance of way.

Q. That comes under maintenance of equipment doesn't it?

A. No, sir, it is under maintenance of way and structures.

4720 Mr. HILL:

Q. Here is the point where I think you do not quite gather the movement we are now referring to:

Suppose a car of merchandise from St. Louis was brought into Little Rock over the Iron Mountain rails and set out into a local train at Argenta. And a car was brought in over your line from Forrest City or Brinkley, or some point on your line; and they were set into the local train, both going up to Morrillton:

Would not the switching on those, the one being a state and the other an interstate car, if they both found their way up on that local train in the same manner, be the same?

Now, would not the movement on the local train—now I am not referring to the additional terminal at Forrest City, or in St. Louis on the other shipment which would not be in this case—but I am referring to the movement on the local train after those two cars were put into it: would not this item be the same for both?

A. If they were going to the same industry?

Q. Yes.

A. Yes, sir, the local switching at Morrillton.

Now I understand this 50% is added for the local switching that is necessary to be done at Morrillton. He based it on the local engine switching, as there is no switch engine at Morrillton.

Q. That is true.

A. The instance you have cited speaks of an interline shipment and a state shipment.

4721 If you had taken a car from a point on the Iron Mountain beyond Little Rock, say at Camden—they may have a switch engine at Camden—but at some point below Little Rock.

Q. That will do.

A. Suppose they have no switch engine at Camden, and take a car coming from Camden to Morrillton, that car would receive that local switching at Camden.

Q. And that mileage would be on the local train and not on the one going up to Morrillton?

A. You don't treat them as trains, but add 50% to all the mileage of the local trains.

Q. But we get all the local trains?

A. You add 50% to the mileage of all local trains and in the end divide that 50% on a ton mile basis.

Here is a car we will say going from a point say 30 miles south of Little Rock to a point 30 miles north of Little Rock; that would be 60 miles. That receives two terminal handlings. If there are 20 tons in the car the tonnage contained in that car would be 1200 tons one mile.

Now, if you have a car coming from St. Louis to this same point through Little Rock, the car we will suppose will travel 200 miles in Arkansas, and have the same weight that is to say, twenty tons. The ton mileage on that car in Arkansas would be 4,000 ton miles, as against only 1200 miles on the car that received two terminal handlings.

Therefore, the car that received only one terminal hand-
4722 ling in Arkansas would be charged with 3⅓ times as much under this method (indicating exhibit) as the car which received two terminal handlings in Arkansas.

That is why I claim this addition of 50% to both state and interstate is unfair.

Q. Don't you think that is taken care of on the other train—in the illustration you have given—by the allowances that have been made for the terminals and all the switching down there?

This proposition we are now after, is after it gets on to the local train.

You see that movement may represent a half dozen, but each of those is taken care of.

You see that 4,000 ton miles you referred to is not 4,000 ton miles in that local train, but that is found reflected in the other train, and it is properly taken care of.

A. Suppose then, it travels the same distance——

Q. Take my illustration and I believe it brings out the point.

A. Let us take my illustration and reduce it to the basis of the local train.

Suppose this travels the same distance as the car in the local train, it will have the same ton mileage and have the same terminal handling charge to it. And in that case——

4723 Judge HILL:

Q. It would not on that train but it would be on the other train. If you study that out you will see that it is taken care of. I do not really think there is any difference between us, if we understand each other.

A. I think there is 100 percent difference between us. Let us take this while it is fresh in our minds.

Take it in a case where the interstate shipment is hauled exactly

the same distance and in the same train—and I assume that is what you are driving at, is it not?

Q. Yes.

A. If the weight is the same there will be exactly the same ton miles for the state as for the interstate shipment.

A. Yes.

A. (continued). And that will assign exactly the same expense to the intertsate shipment which has only one terminal switching as to the state shipment which has two terminal switchings.

Q. It would not be two on that train?

A. It would be two on the same mileage.

Q. No, Mr. Nay, you are mistaken.

A. My illustration is, they are handled the same distance on the same train.

Here is a shipment which originates at Little Rock, say for example. It is destined sixty miles south of Little Rock and is taken out on a local train running south from Little Rock.

4724 Here is a shipment which originates at St. Louis and comes to Little Rock on a through train and is there put on a local train having the same destination as the local shipment. Each shipment travels (supposing the weight is the same) the same distance on that local train and has the same number of tons one mile; and each one would receive the same charge for this additional terminal service; while one has two terminal switches and the other one only one.

Q. The interstate shipment would have a terminal switching at Little Rock, taking it off the through train and putting it on the local train; would not that be the same switching as if it were taken off your line or picked up off the industry track? There is the point you overlooked.

A. No, sir, I do not think it would be the same, because the industry switching would be more.

Q. There is some evidence on that subject here—a whole mass of it. But for the purposes of this question, this switching, whether for the same degree, in some cases it might be more and in some cases less; but taking it that there is switching service performed in Little Rock to get it off of the through train from St. Louis and put it on the local—say it was going to Malvern—and taking the local car and putting it on that local and taking it to Malvern—that would be the same thing, would it not?

A. That would be similar. But how about a car picked up between Little Rock and Malvern?

Q. State.

4725 A. It would necessarily be state.

Q. There would be no interstate car you could pick up to parallel that.

You are speaking now of the comparative switching of the two?

A. No, but there might be an interstate car come into the train at a junction point.

Q. It would be taken care of just like the other.

Let us stick to our illustration first.

Take the switching done on a car brought from the through train onto the local train, and one picked up from an industry track and put on the local train, and both put out at Malvern:

Is not there the treatment just alike, and properly so?

A. Those two cars I think would be treated alike.

Q. And properly so?

A. I am not so sure about that.

Q. The point of difference is the amount of switching I suppose you have in mind?

A. That would be one point of difference.

Q. There is a good deal of conflict in the evidence on that point. I do not care to go on that. We have a lot of switchmen who have testified on that. I suppose you will acknowledge their superiority to you in that respect?

A. Every time.

4726 Q. I don't care to discuss that matter with you, but the method of taking care of it in the accounts I wanted from you.

A. Any state cars that are taken up on local trains and set out at local stations would have two terminal switchings for each shipment.

Q. There is no doubt about that.

A. While the interstate shipment would have only one.

Q. But you cannot get your interstate shipment on to that train without switching it onto that local train, is what I mean. Don't you see that?

A. It can be set in at the terminal point—say at Little Rock. It can be put into the train.

Q. That is a switching service?

A. Yes, sir, but that is not switching by a local train.

Q. It is not switching by the local train?

A. No, sir. And this 50% is added for switching by local trains.

Q. Would not that be done by the local train?

A. No, sir.

Q. If I remember it correctly, these switchmen testified it was.

A. At Little Rock?

Q. Yes. I am speaking from memory now and I may not be accurate.

A. If the local engines do their own switching at Little Rock, of course that would be true. But that would be an unusual

4727 condition.

Col. MOORE: That is not a fact. A switching engine is maintained there at Little Rock.

A. But here is a case: take this car which goes from St. Louis to Little Rock, and goes 60 miles south of Little Rock to a station; that 60 miles with 20 tons of freight makes 1200 tons one mile and has one terminal expense.

And here is a car which is picked up 30 miles south of Little Rock, by this local train, and hauled 30 miles south of the distance at the south point, it moves sixty miles, weighs twenty tons, and has 1200 tons one mile.

This first interstate shipment has the same number of tons one mile and receives the same amount of this extra charge of 50% as the shipment which moved from this point 30 miles south of Little Rock to a point 90 miles south of Little Rock; while the second shipment unquestionably has two terminal switchings by that local train; and the first shipment had only one terminal switching by that local train; and yet the ton miles in each instance are the same.

Now it is cases of that kind which I was trying to get at, which would work an injustice to the intrastate traffic.

In other words, under the most favorable circumstances there might be an even break; but under circumstances such as I have indicated, the intrastate business is relieved of a large part of the expense with which it should be charged.

4728 Q. I believe we can show you a large part of that has been taken care of,——

Col. MOORE: I would like to call the attention of Mr. Nay to one of the instances you have recited .

Mr. Hill has put a hypothetical case, where state freight would originate at Forrest City, go to Little Rock and then go on to Morrillton; and compared that to an interstate shipment.

In the light of the evidence in this case I understand the state shipment would have the terminal service necessary to properly load it and so on, at Forrest City; then be put in the local train running between Forrest City and Little Rock, and then go on to Morrillton.

A. Yes, sir.

Q. If you call the transferring of a car like that "terminal handling" it would mean that the car would receive three terminal handlings, would it not?

A. Yes, sir.

Q. The car shipped from St. Louis would receive its first terminal handling at Little Rock on the transfer of it to the local train; and the second at Morrillton: if you should treat transferring it from one train to another as a terminal handling, there would be three handlings of that as against the two handlings of the interstate freight.

Judge HILL: That would be two on the Iron Mountain, but there would be another terminal handling on the other road.

A. In his first question he assumed the haul to Little
4729 Rock would be on the Rock Island road.

Judge HILL: I compared it to the St. Louis shipment where the first terminal handling would not be in this case at all. In the other case it would be on the Rock Island road.

4730 Cross-examination of FRANK NAY, continued, as follows:

By Judge HILL:

Q. I believe we were playing switchmen, when we quit, weren't we?

A. We were doing local switching.

Q. Suppose a case like this: State freight hauled on a local train,

which originated at a point where the local began its run, say Little Rock for instance, or which was put on a local train and which was destined to a station at the other end of the local train's run: That is, where the state freight was run from one terminal to the other:

What about the switching on that proposition?

A. There would not be any local switching.

Q. No station switching?

A. No station switching by a local train on that.

Q. That might compensate for some of these possibilities you have conjured up here this morning, might it not?

A. I think when you speak of the possibilities conjured up——

Q. I do not mean that offensively at all, Mr. Nay.

A. I think that is putting it pretty strong.

I think the illustration I gave is one that would happen every day in a local train.

Q. I do not agree with you on that, but that is more of
4731 a switching proposition than a local train one.

But if there should be such as that it would be like the one I have mentioned?

A. Yes, sir, it is my understanding cars like that are more apt to move on through trains, in the ordinary course of business, a car going from one terminal to another.

Q. More ordinary than practical?

A. No, sir, I think every practical railroad man would put that car right on a through train to go straight through to the next terminal; and I think that would be more of a conjured up case than the one I gave.

Q. I don't think so. But the conductor's wheel report would show that.

The Iron Mountain has, and I think the Cotton Belt, but I do not know so much about the Cotton Belt as it is a kind of "second fiddle" in this case—with due deference to Mr. Kimbell—it had switch engines at several points other than the terminal points; and any state freight destined to such point, originating or destined to a division terminal from such points, would have no station switching done for it at all by the local train, would it?

A. No, sir, and I should imagine in those cases the same thing would be true as is true of cars moving between regular terminals, that the through trains would handle the cars, largely.

Q. Do you mean by that that the local division would be the same feature as the through division?

4732 A. No, sir. I mean by that, that the through trains would more than likely stop at those local termini and pick up and set out cars that were destined thereto, and the very fact that they had switch engines there would no doubt make that move. Of course, the operating men could tell better as to that, but in my experience that is usually the case.

Q. The local division points, for instance, between Fort Smith and Little Rock and Russellville, I think at one time it was a through division and at another time it was made a local division.

That frequently occurs, that there will be a local division point that is not a through division point; and there is a great deal of traffic handled at such points; it is not an insignificant matter. Isn't that true?

A. Yes, sir.

Q. And the situation I have stated to you here would occur in such cases as that, would it not?

A. Yes, sir, it would occur. But I think the regular operation of the road from day to day would show that the cars which moved between division points, local and through, would be hauled very largely by the through trains.

Q. That is a matter of detail.

You were just speaking generally of the way it should be done, on the theory that as it should be done that way it was done that way.

A. As I say, that is a matter of good railroad practice.

4733 Q. Because you think it was the usual practice you think the Iron Mountain Company did that?

A. I do not know that their practice is worse than others.

Q. You are assuming they followed good railroad practice?

A. Yes, sir.

Q. You have no knowledge directly as an operator, yourself?

A. No, sir.

Q. I believe you testified in the Chicago case you were a bookkeeper who recorded history and did not make it?

A. Yes, sir,—or words to that effect.

But I also testified I had been on the road considerably and observed operating conditions, and when I speak of these cars being picked up or set out at these local division points, I am sure that is the practice—of course, that is a matter of history, too, because the train reports show that.

Q. Mr. Nay, I find on page 438 of your testimony this question:

"It is an addition of 50% mileage to provide for possible extra maintenance expenses due to yard service. The accountant, Mr. Wharton, who filed this, stated it was an arbitrary assumption; that they had no information or no means of obtaining any information. What do you think about that method of proceeding to make such a division of this class of expense."

And this was your answer:

"Making an arbitrary assumption, without anything to base on, might or might not lead to true results, and is more apt not to, I think."

4734 Col. MOORE: Is that maintenance of way you are speaking of, Judge Hill?

Judge HILL: I think it is, yes, it is maintenance of way.

Q. Now, I want to call your attention to the testimony of Mr. Wharton. I believe you said you had read it.

At page 576 he said:

"Q. I see you added 50% to the engine mileage of local trains, on account of station switching: Where did you get that per cent?

A. That percentage was worked up after consultation with Mr. Hamilton and with others, and was simply an arbitrary percentage added.

Q. That was simply an arbitrary assumption?

A. Yes, sir; an arbitrary assumption.

Q. You had no knowledge or information which qualified you to——

A. Except such as I just stated, discussing the matter with Mr. Hamilton and others.

Q. And you had to adopt some basis—an arbitrary one—just like it has been said in this case that the revenue basis was an arbitrary one? You had to have a basis and you had to take something for that basis?

A. We felt that something should be added to local engine mileage for that purpose.

Q. But you did not know whether 50% or some other figure should be added?

A. No, sir.

Q. Then you added 150% for each engine mile to make it equal a car mile: why did you do that?

A. We added 150% to each engine mile, also after consultation with Mr. Hamilton and with others, as representing the difference in the weight of the engine and cars.

Q. Did you weigh an engine and car for the purpose of ascertaining from actual weight what the difference was?

A. No, sir.

4735 Q. Then what reasons were given in your consultations—if you had consultations you must have developed some reasons—for adopting that per cent? What was the reason, that is, what I want to ascertain, because this is the foundation of your figures?

A. Well, if hearsay testimony is not competent I would not be able to say.

Q. So you are unable to make an explanation?

A. Except upon information I gathered in consultation with men who were qualified to pass on that."

Q. Now, Mr. Nay, in view of that testimony, do you think it is fair to say that an accountant has filed a statement and he had no information or no means of obtaining information upon, when he says here he took that figure not from personal knowledge but from information received from men whom he believed to be qualified to pass upon it?

Col. MOORE: Is not that maintenance of equipment. There is only one 50% added on to maintenance of way.

Judge HILL: It is on page 576 I read from.

Col. MOORE: You refer to his adding an additional 50%.

Judge HILL: You questioned him about both those propositions and he answered them both, that he gathered it after consultation with men he relied upon as competent to pass on it and not from personal knowledge.

A. Well, what I said is this:

"A. Making an arbitrary assumption, without anything to base it on, might or might not lead to true results, and is more apt not to, I should think."

Q. But that answer, taken in connection with the way the question was put to you, would indicate that the accountant had
4736 filed this statement as an arbitrary assumption; that he had no information or any means of obtaining information upon the subject.

Now my question is, do you think you, in answering the question in the way you did, and the question itself, was a fair criticism, in view of this testimony?

A. I think so, yes, sir.

Q. Have you any knowledge yourself, personally, from your own knowledge, of the extra cost of handling state over interstate business?

A. Now, just what do you mean by that? It is switching we are talking about.

Q. No, I mean the broad proposition of extra cost of state over interstate business as has been testified to in these rate cases as being three to seven times: Have you personal knowledge, yourself, of that proposition?

A. I have personal knowledge of the fact that a shorter haul involves a greater expense than a longer haul; and that it costs more to handle less than carload business than carload business, and things of that kind.

Q. Why, certainly.

A. And that the average length of haul for intrastate business is much less than the average length of haul of interstate business. That is a matter of record.

And coupling that with the first statement, that the shorter haul is more expensive than the longer haul, as the average haul for intrastate is less than for interstate, then the intrastate business must be the more expensive.

4737 And as the greater percentage, ordinarily—it is true in the case of the Iron Mountain—of the traffic of the intrastate business, consists of less than carload business, than is the case with interstate traffic, it follows that——

Q. Without going into the details, Mr. Nay, have you an opinion of your own from your own knowledge, as to the extra expense of state over interstate business?

A. As to the entire percentage, no, sir, I have not.

Q. You rely upon the opinions of the operating men in whose judgment you have confidence?

A. Yes, sir. I understood your question, but I have some knowledge on the subject.

Q. I say, as to what this extra cost is.

A. Yes, sir, and my answer gave some of the knowledge I have. But I do not claim to have sufficient knowledge of the details of operating conditions to say that the percentage should be so much.

Q. That is what I had assumed from the stand you had taken?

A. Yes, sir.

Q. You made up statistics in this case—at least they were made up under your directions

A. In which case do you refer to?

Q. In these various rate cases, when your road has been involved in them?

4738 A. Yes, sir.

Q. And you have added 150 and 250 and various other percentages there upon the opinions of operating men, haven't you?

A. Yes, sir.

Q. Of which you had no personal knowledge but which you derived from men in whom you have confidence and who have knowledge of the subject?

A. Not exactly that.

I testified I had some personal knowledge of these conditions but not sufficient to determine the percentage.

But that additional percentage is based upon the testimony of men in whom I have confidence, as having had experience in operating railroads.

Q. But you do not seem to be willing to accord to Mr. Wharton the right to have that same confidence in the men whom he consults, do you, Mr. Nay?

A. Well, I do not know the men whom he has consulted. As I recall it, they were not named in the testimony.

Q. No, but you did not give in the testimony the names of the men you consulted when you made up your statistics. You consulted with men in whom you had confidence and it is fair to assume that he consulted with men in whom he had confidence—because he said so.

A. I stated these were men of long years of operating experience in railroading.

4739 Now, I do not know whether it is the same class of men Mr. Wharton consulted or not. He consulted with Mr. Hamilton and others.

Q. He says "who were qualified to pass on it." He may be mistaken in his judgment, as you may be mistaken in your judgment of the men you consulted; but when you have consulted men you esteemed as qualified to pass upon those questions and took their judgment upon it, don't you think you have acted fairly in doing so?

A. Yes, sir, but I have given candidly the experience of the men on whose judgment I based my figures. And as railroad men who have had operating experience have uniformly testified to this great increase of the expenses of state over interstate, it is hard to believe that men of the same experience and in the same line of business would testify to something entirely different.

Q. What Mr. Wharton testified to here was men who were qualified to pass upon these particular items in question.

I have used the broader question to you as a general proposition.

A. What was the experience of these men?

Q. I don't know. He simply said, men whom he considered

qualified to pass upon this question of the extra switching and so forth.

When he has done that, do you think he is subject to the criticism that this question and answer implies?

A. I think he should give the kind of experience the men
4740 have had in whom he reposed this confidence.

Q. Turn to page 444 of your evidence, Mr. Nay.

"You will find yard locomotive expenses divided on the basis of double the number of cars handled in each class of service.

I don't know, so I am asking you the reason there could be for that difference?

A. I don't know. One is based on the cars handled and the other on the car mile."

Did you look at the Cotton Belt exhibit on that same proposition as the Iron Mountain?

A. I do not know.

Q. That is on the basis of four where the Iron Mountain is two. And it is explained in there, as on account of the difference in the length of the haul. Do you remember that?

A. I think I do recall that.

Q. You seem to have treated that as if it were a question of state and interstate handling instead of a question of length of haul. I supposed you had misunderstood the purport of the exhibit there.

A. I do not believe I understand this.

In each case there seems to be 50% added for extra repairs and 75% added to the local mileage for extra mileage in repairs.

Q. I do not think that is the item?

A. I thought you said locomotive mileage.

(Examining paper.) That question and answer referred to the different bases used for locomotive and cars; the terminal yard switching—or, rather, to the repairs incident to yard work; being
divided on the basis of the cars handled, and the terminal
4741 repairs for freight cars being divided on the basis of car miles.

He asked me if I could see a reason for that difference and I said I could not.

Q. In the record on page 444 you will find this question:

"Q. The state accountants have allowed double handling in ascertaining the expense of terminal handling of the cars, but they made no such allowance in the case of yard locomotives. Is there any reason for that distinction in your opinion?

You will find yard locomotives expense divided on the basis of double the number of cars handled in each class of service. I don't know, so I am asking you what reason there could be for that difference?

A. I don't know. One is based on the cars handled and the other on the car miles."

I want to call your attention to the fact that that doubling is not for the purpose of helping that matter but to correspond to the length of the haul of the two, as shown in the Cotton Belt exhibit where the same proposition is handled on the basis of four, on ac-

count of the difference in the length of haul. Do you catch the point?

A. The length of the haul of the local and through cars?

Q. The average haul of the two trains in the Iron Mountain is practically the same as the division haul; and on the Cotton Belt it is practically double that. That has been explained in the evidence.

A. (After examining exhibits.) That does not give me any
4742 light yet as to why my statement should be questioned; because in the first place there are certain repairs to locomotives that were found to be assignable under that method to yard switching, yard service or terminal service, as it is called; and those repairs to locomotives were divided on the basis of the cars handled at terminal points.

Now, when it came to the question of similar repairs for freight cars, those repairs which they found were due to the terminal handling, instead of dividing them on the basis of the cars handled, they were divided on the basis of the car mileage modified by multiplying by two in the case of the Iron Mountain and I understand you to say multiplied by four in the case of the Cotton Belt.

The point I was making was, that I could not see why, if the basis of cars handled was a correct one in the case of repairs to locomotives, the same basis should not be used with regard to freight cars.

Q. Do you understand that that doubling there was due to the difference in the run, taking charge of it and so on?

A. No, sir, I do not understand why it was doubled.

Q. That is what I supposed from your answer.

A. But the run is not double. The average run shown on these statistics for local train is 63.10 and for through trains 70.8.

Q. I said a while ago it was nearly the same and that was about double?

A. Yes, sir.

4743 Q. Mr. Nay, turn to page 445 of your testimony where you refer to station expenses under the general head of "Transportation Expenses."

A. The paragraph reading "the large item of station labor, what we call platform labor, loading, unloading and checking, is in connection with the carload business"—that should read "in connection with the less than carload business."

Q. That is the point I was getting at. You are referring to the less than carload business there?

A. Yes, sir.

Q. Your statement is that it is not fair to divide the expense on the basis of tons handled, including the less than carload business?

A. Including both less than carload and carload.

Q. Mr. Nay, in order to get the record straight I wish you would restate your proposition right there, will you?

A. My answer should have read like this:

"The tons that are included in the basis for this division, with the trans-state omitted, includes both carload and less than carload

shipments. Practically all carload traffic is loaded and unloaded by the shippers and consignees, so the only item under the head of "Station Expenses" that refers to carload business is office expense, the expense of billing, recording and so on.

The large item of station labor, what we call platform labor, loading, unloading and checking, is in connection with the less than carload business.

Therefore I do not think it is fair to divide the expense on the basis of the tons handled, including the carload business, be-
4744 cause a greater proportion of the state tons handled is less than carload business than in connection with the interstate traffic. That being the case, the basis used does not charge a sufficient proportion of this expense to the state traffic, and charges too much to the interstate traffic."

What I am trying to say there is, that of the total state tons handled, a greater percentage is less than carload than in the case of the interstate business.

That being the case, the basis used does not charge a sufficient proportion of this expense to the state traffic, and charges too much to the interstate traffic.

Q. Now, Mr. Nay, please turn to Exhibit 26 of the Iron Mountain Road; that is for October, 1907, and make a calculation (I think you can do it in a moment; you need not carry it out to its fine points) as to the state and interstate carload and less than carload tons.

A. (After examining exhibit.) It looks as if somebody had figured it out for me in advance.

Q. Better not take any doctor's figuring. We have all sorts of doctors here.

A. It is shown that for the month of October, 1907, the carload tons of interstate freight, not including trans-state, were in round figures 270,000; and the less than carload 20,000, the less than carload being about 7%, as it is figured here (and it is not far from that).

For the intrastate the carload tonnage is in round figures
4745 128,000; and the less than carload 8,000, or in round figures 6%, as it is figured out here.

Q. This difference between state and interstate on that proposition does not work out according to those October figures as you supposed, do they?

A. No, sir, they do not. This October figure shows that the conditions for the month of October, 1907, are slightly the reverse of what I have supposed.

Q. Take the test month on the Cotton Belt, January, 1909?

A. (Examining exhibit.) This shows a similar condition, a difference of about 1%: 13% of the total interstate tonnage being less than carload and 12% of the intrastate being less than carload.

Q. So far as I know those are the only statistics in this case by which you can get a statement as to the comparative percentage of less than carload state and interstate tonnage. And taking the

only data we have in the case, your views here are based upon a mistaken premise on that point, are they not?

A. If these two months are representative of the entire period. I would not recede from my view without having the figures for a representative period.

Q. That is what I stated in my question. So far as I know—like your statement to the Interstate Commerce Commission—we have given you the best we have got, and that seems to be all there is in the case.

4746 A. No, sir, I beg your pardon. It is possible to get a whole year here, 1908 or 1909 or 1910, could have been compiled. But in the case of the Interstate Commerce Commission hearing we gave them the figures for 13 years and then up to the minute, so there is no parallel at all.

Q. The railroads could have compiled it, but in my question I say I am putting before you all the data we had.

A. I presume the state could have compiled it, too.

Q. In the course of time, probably. But the state is not a moving party here, either. You have referred to that proposition several times in your testimony, not only on this proposition but in several others, I believe, as one of your reasons for attacking the correctness of these figures.

Q. If these two months are representative of the business of these two railroads in Arkansas, so much of your testimony as is based upon the other proposition would be erroneous?

A. Yes, if those two months are representative of the entire business. But I would not believe that, though, until I saw the figures for the entire period.

Q. Turn to page 448 of your testimony: You criticise the division of fuel expenses, using the percentage obtained in a test made on the Cotton Belt in October of 1908:

I want to read you the testimony of Mr. Doddridge on that point, reading from page 107 of the record in this case.

4747 "Q. Fuel, I presume, is another one of the chief items as you worked that up in the Cotton Belt case. Would the actual figures you worked up on fuel cost between local and through trains on the Cotton Belt, apply generally on the Iron Mountain?

A. I presume that those proportions would be applicable in a general sense to the Iron Mountain, or it ought to be.

Q. That is, you mean the relation in the cost between the two classes of trains?

A. They ought to be unless there is some difference in conditions on the Iron Mountain that might change the relations.

Q. Do you know any conditions between those two roads (you have been general manager of both) that would change the relation of the fuel cost between them, as to the proportion consumed on the local as against the through, or the through as against the local?

A. I do not know of any conditions that would change those relations on the main line of the Iron Mountain as compared with the Cotton Belt—the Cotton Belt Railroad is mostly main line. The Iron Mountain main line is a very similar road through Arkansas,

as to grades and other things—I guess the Iron Mountain is a little better than the Cotton Belt, some parts of it—and of course, the Iron Mountain has other divisions, like your road from Little Rock to Fort Smith, that used to be very different from the Cotton Belt. I guess it has been improved now.

Q. It has all been improved. You must not indicate that anything going out of Fort Smith has not been improved, or we will have a falling out.

A. In a general way the test on the Cotton Belt ought to reflect the general average conditions."

Now, Mr. Nay, would not Mr. Doddridge, having served as general manager and having been in the operating department of both those roads, be better qualified to pass on that question than you are?

A. Was he general manager during these months?

Q. I think not.

4748 Col. MOORE: Not for years before that.

Judge HILL: I understood he had the test made. Mr. Kimbell directed it. It was done at the instance of Mr. Doddridge and Mr. Doddridge testified that he understood the statistics of those two roads very thoroughly.

A. I would not like to answer that question direct.

But I still adhere to my view that no one month on the same road, and within the same period, can be taken as representative of the entire period. And to take a test made on another road in a month entirely outside of the period might represent far from the actual conditions.

Q. You do not agree with Mr. Doddridge, in other words?

A. No, sir; I do not.

Q. While we are talking about Mr. Doddridge, at page 91 of the record he testified as follows:

He was asked how he would figure out the cost of terminal expenses on passengers (he is now discussing the passenger terminal matter, and a little later I will show he applied it to both passenger and freight) he was given a quotation from some testimony he had given in the Missouri case and was asked if that was correct and he said "no." The answer reads as follows:

"Since I made that statement I, of course, have gone into the subject further, and I don't think that covers all of the elements—that is what I am getting at.

Q. What method have you got that got at that terminal expense, if you cannot take this method?

A. I find among my memorandums a method that we de-

4749 signed for that purpose, or formula. I did not give it in my reasons, because the information necessary, upon which to predicate it, is absent, but I will read the example; it is self-explanatory:

Take the St. Louis Southwestern Railroad for the year ending June 30, 1908; they carried 928,313 state passengers; double this number to compensate for two station handlings. The number then indicates ninety-two percent of the total passengers handled.

The interstate passengers handled were 145,351; allowing one

handling for each passenger, this constituted 8% of the terminal cost.

The intrastate passengers produced 55 percent of the passenger miles and should be charged with 92% of the terminal expense.

Now, if you know the terminal expense in dollars and cents, it is a very easy matter to arrive at the extra cost, on that account, per passenger—either class of passengers."

And further on, at page 96, he testified he would substitute the ton for the passenger, and apply the same principle in freight traffic, and I ask you what you think of that as a fair method for determining terminal expenses?

A. For passengers.

Q. Yes, and then for freight. He applied the same principle in both cases.

A. By "terminal expenses" do you mean station expenses just now? Because I understand you divide station expenses only on the basis of tons.

Q. That is true.

Col. MOORE: You read on page 91?

Judge HILL: I did not read it but just referred to what was said there.

4750 Col. MOORE: Then you should call Mr. Nay's attention to what he said on page 92, as follows:

"Q. You think that is a good, fair basis for ascertaining the extra terminal cost for passenger service?

A. It would be somewhat more than fair to the state, for the reason that there is a certain percentage of these 145,351 passengers that do not make any terminal expense at all in the state.

Q. It is the best method on the subject that you know of, isn't it—better than this Missouri method, or any other?

A. I think so; this is the result of the reflection and consideration, and this shows it figured out to a conclusion, using hypothetical figures, that the state terminal cost upon this road, and, based upon these statistics, amounts to ten to one."

Judge HILL: That is what it amounted to on the Cotton Belt?

A. That does not change my mind any. I still think if you get a less than carload business for a representative period there would be more of it.

Q. I am not asking you about that. I am putting this proposition to you:

On Mr. Doddridge's testimony here, if you agree with his method of dividing the terminal expenses, both passenger and freight, by doubling the station expenses in that terminal handling?

A. I understood we had already gone over the freight expense before, and that is the reason why I stated I have not changed my mind on that.

Q. What do you say on passenger?

A. I say the same as in direct examination, that there are

4751 certain trans-state passengers included in there that involved no station expense at all; and this method does not assign enough to the state.

Q. You do not agree with Mr. Doddridge?

A. I do agree with him. He pointed out the same thing.

Q. He said, taken altogeth r it was the best he knew on the subject?

A. I think his own answer indicated that a better method would be to eliminate the trans-state passengers.

Q. While on that subject let me tell you about some of the evidence in this case:

Memphis is treated as an Arkansas point in this case. The expense is all charged up to Arkansas. Of course, all the travel is interstate and from Memphis to Texas would be called trans-state.

A. From Memphis to Little Rock is interstate.

Q. Yes, and the expenses of Memphis are treated as if incurred in Arkansas.

A. That is by some arrangement between you?

Q. No, sir. I have been kicking against it and am still kicking. It is by "force of arms" that that is in here in that way. But those are the facts, there is no dispute on that point, and that the traffic from that point is interstate traffic.

The same thing is true of Fort Smith, but to a lesser extent. Two passenger trains, run over the bridge which makes it inter-
4752 state. All of the freight traffic is interstate as they do not use the bridge at all for the freight but only for the two passenger trains.

So far as the Cotton Belt is concerned I believe the yards in Texarkana are in Texas: isn't that true Mr. Kimbell?

Mr. KIMBELL: Yes, sir.

Q. You know the travel out of Texarkana on the Cotton Belt and out of Fort Smith and Memphis on the Iron Mountain would be a large volume of traffic.

Col. MOORE: You mean trans-state?

Judge HILL: I am speaking of the traffic. It would be all interstate or trans-state and as to all of it there would be two terminals in Arkansas and on trans-state there would be one, out of each of these points.

Would not those facts modify to some degree at least, your objection to this method?

A. Yes, sir, that would modify it to a degree. But what I had in mind when I spoke of trans-state—I did not have in mind particularly Fort Smith or Memphis or Texarkana, but passengers from St. Louis to Texas points.

Q. I understand that. And that is why I call your attention to the local conditions and ask you if those local conditions would not modify your position?

A. Yes, sir, but there would still be certain trans-state passengers in these 145,000; say passengers from St. Louis to San Antonio or from the southeast going into Oklahoma.

Q. Of course there would be some, but in these there
4753 would be the interstate passengers from Fort Smith and Memphis to Little Rock that would have two handlings under this method of accounting and they are only charged with one.

A. Possibly those might offset each other so the difference would be "negligible".

Q. If anything it would be in favor of the state. There is a pretty heavy travel out of Fort Smith and Memphis and Texarkana, as you know, don't you, Mr. Nay?

A. Especially out of Memphis and Fort Smith.

Q. Did you say that the stuff from the southeast to Oklahoma would be trans-state? That would get a Memphis handling, too, wouldn't it?

A. Yes, sir, say from a point like Nashville, Tennessee, to Oklahoma, that would certainly be trans-state.

Q. It would go through Memphis?

A. Yes, sir.

Q. And would have one terminal handling in Arkansas, so far as this case is concerned?

A. Yes, sir, I see your point—no, there would be no terminal so far as station expense is concerned.

Q. All Memphis station expenses are charged up as if incurred in Arkansas?

A. I know, but the passenger does not incur any station expense in Memphis. He buys his ticket at Nashville, and gets on the sleeper and stays on there until he gets off in Oklahoma.

4754 Q. Do you know of any through trains from Nashville, Tennessee, to Oklahoma through Memphis, in that country?

A. I am not familiar with the situation but I know there are sleepers on the run there, that do not stop at Memphis. There is one that starts from Chicago and goes to Hot Springs.

Col. MOORE:

Q. What terminal service would he get?

A. He does not get any station service.

We are apt to get confused between those termed "terminal expense" and "station expense". Station expenses are the wages of the agent and ticket sellers, and baggage, checkers.

Q. And for the heating and lighting of the station?

A. I don't know whether that is a station expense or not. I do not know whether you have included that in station service or not.

Judge HILL:

Q. Have you, Mr. Johnson.

Mr. JOHNSON: Yes, sir.

Q. And cleaning? You have to clean that station. You have the porters, watchmen, guards and all that sort of thing. This fellow gets some benefit of that delightful Memphis station, does he not?

A. Some, but it would be pretty small, I think.

Q. About the only thing he would not get would be another ticket

and probably rechecking his baggage: isn't that about the only difference?

A. I don't know what he would get under "station serv-
4755 ices" at Memphis. He would get out on the platform, out of one car and into another car.

The train conductor, the brakeman, or the train porter would probably assist him off and show him what train to go on. I do not think he would get any benefit of the station expenses at Memphis.

Q. You testified, I believe at page 474, as follows:

"I heard the testimony of some of these same witnesses in the Missouri Case and it was to the effect that the extra cost of state over interstate business on a ton mile basis would vary from 10% minimum, to 50% maximum.

Now, this compilation presented here, which is complicated and produces a result which shows 86% increase cost, indicates that the state's witnesses realized that they were mistaken in the Missouri Rate Case in putting the extra cost so low. But it is still below what the railroad operating men testified to."

I call your attention to the fact that Mr. Ludlam (and I think he is the only one who testified in both cases) said he had made that estimate in the Missouri Case and that he thought it was still true, that there was a difference in the conditions in Missouri and Arkansas. Isn't that a fact? You said you had read his testimony?

A. I do not recall that, Judge Hill. Of course, the record would show it.

But there is such a mass of testimony in this case that I hope I would be pardoned if I do not remember everything exactly as it was.

Q. It seems to me when you go to quote anybody it would probably be better to quote him exactly.

4756 A. I think I have quoted him exactly in the Missouri Case. 10 to 50 and I think probably he was pretty easy on the 50; he thought that was probably too high.

Q. Isn't it further true that they have not produced this 86% as being the exact increased cost but merely the result of calculating according to this formula in which they say (whether you agree with them or not) that they have used the maximum and if that was true it would indicate that the actual conditions would be less than the 86%, wouldn't it?

A. Yes, sir, if it is a fact that they had used a maximum in every case.

But I think an analysis of their figures would indicate they had not used the maximums in every case.

Q. Yes, I know the doctors have disagreed on that proposition.

Turn to page 479 of your testimony. You say at the bottom of that page:

"Again, the car miles in local trains, which carry no Pullman cars, are treated just the same as those in through trains which do carry Pullman cars;"

Are you familiar with what are local and what are through trains on the Iron Mountain?

A. No, sir, I cannot say I am.

Q. Are you under the impression that the local trains do not carry Pullmans on the Iron Mountain road?

A. I am under the impression that they run many local trains that do not carry Pullmans. I am sure of that, because I have ridden on some of them.

4757 Q. The evidence in this case on behalf of the railroads, put in by Mr. McPherson, is that there are eight through trains on the Iron Mountain and 48 locals:

Isn't that right, Mr. Johnson?

Mr. JOHNSON: I know it is eight through trains.

Q. Eight through and forty-eight locals.

And of those through trains, one of them is the fast mail that carries just a sleeper and no other passenger coaches.

I do not know exactly how many of the locals carried Pullmans in 1907, but approximately it was thirteen. I may be off one or two trains on that because I have not a timecard for that period. I looked at the timecard of a more recent date and it was 15. But I presume that is approximately correct.

So there are really eight through trains carrying sleepers and 13 local trains carrying sleepers:

Would not that modify materially the objections you have made to some of these divisions?

A. It might be that those local trains that carried sleepers are the kind I have in mind as through trains.

Q. This information is given in Mr. McPherson's Exhibit 46?

A. There are trains included in this list of local trains, which I had in mind as through trains.

(Witness refers to Exhibit 46).

4758 Q. That is what I supposed.

A. For instance, "Number 8 from Texarkana to the state line a run of 305 miles": That is the kind of train I had in mind as a through train.

Q. Now, after seeing that exhibit, Mr. Nay, don't you think the state was justified in carrying forward a division between local and through trains?

A. No, sir, I cannot say so, Judge Hill.

They might possibly have adopted a different term—after looking at this statement the short runs which is really what the local train is, it is a short run which serves each station on the run.

Now, if a division had been made of some class of passenger trains, short trains which serve each station on the run.

Q. But you see the division the railroads made of it. The state did not make that division.

A. I understand that. And the railroad did not make any division between local and through expenses.

Q. They gave a great deal of testimony.

A. Did they?

Q. Yes, a great deal as to the difference between the local and through.

A. I have not seen that.

Q. And, so we will have no misunderstanding as to what was local and what was through, we asked Mr. McPherson to file an exhibit of what was local and through, and this exhibit 46 was the result of that request.

4759 That is an entirely different situation from what you thought it was when you gave your testimony, isn't it?

A. It is different in this way: Mr. McPherson's classification of local and through is not the same classification I had in mind.

Q. That is what I supposed.

A. But it would be just as easy to work up the figures on the classification I had in mind as it would on Mr. McPherson's classification.

Q. But unfortunately we did not have your classification and we did have Mr. McPherson's.

This statement I have called your attention to on page 479 would lose its force, wouldn't it?

"Again, the car miles in local trains, which carry no Pullman cars, are treated just the same as those in through trains which do carry Pullman cars; and that works an inaccuracy, because it does not assign a sufficient proportion of the expense to the traffic carried in local trains, although no division has been attempted here between through and local."

A. You will notice I said "local trains that carry no Pullmans": that expression indicated that I understood that some local trains did carry Pullmans.

Q. I did not so understand you.

A. You will find from the expression it is so worded.

Q. I understood you to mean local trains carried no Pullmans and that through trains did carry them.

I might have misunderstood but that is the impression your testimony made on my mind.

A. I think you will find it is not so.

4760 Q. I do not care to discuss it if you say that was your intention.

A. I intended to say the locals that did not carry Pullmans, because I had in mind the fact that some did carry Pullmans.

Q. But the fact that more of the locals did carry Pullmans than you supposed would change your opinion, would it not, on the point in which you criticised the exhibit on the Pullman proposition?

A. No, sir, I don't think so, because I had in mind the fact that some of those locals did carry Pullmans.

Q. Some of those locals did carry even three Pullmans—that Texas train for instance.

Col. MOORE: Where did you get the information that some of the locals carried three Pullmans?

Judge HILL: From the time card. I have already stated I did not have a time card of that period but a recent time card.

Col. MOORE: Do you recall what local carries three Pullmans?

Mr. HAMILTON: It is Number 8.

Mr. JOHNSON: It is the local train from St. Louis to Texas.

Judge HILL: It is the one that is listed as 305 miles through the

state of Arkansas and the time card I examined shows three Pullmans.

4761 Col. MOORE: Isn't that an interstate train?

Judge HILL: Not according to Mr. McPherson. He did not divide between interstate and state. He divided between local and through.

Col. MOORE: If it is from St. Louis to Texas it is not a local Arkansas train, is it?

Judge HILL: None of those Memphis trains are local.

Is not my information about the Texas train correct, Mr. Johnson?

Mr. JOHNSON: I don't know how many Pullmans it carries.

Judge HILL: A recent time card shows it had three. I don't know whether that was true in 1907 or not.

Previous question read to the witness as follows:

Q. Some of those locals did carry even three Pullmans—that Texas train for instance?

A. I don't think so. Because the fact that they carry Pullmans would indicate they were doing interstate business.

The state's witnesses have estimated 25% only of all passengers carried in Pullmans to be state passengers; and another reason is that the trains I had in mind were those local trains that do in my judgment the majority of the state business, and that carry no Pullmans. Those were the ones I had in mind.

If a separation had been made between those trains that carry no Pullmans and do this local business, stopping at every station; and on the other hand including the trains that do the through

4762 business, whether they are classed as local trains in this exhibit or not, the effect of that kind of a separation which in my judgment would be similar to the separation between the two kinds of freight, would have thrown a greater proportion of the expenses into the state traffic than is thrown by the method of consolidating them.

Q. But if you would use the method of division Mr. McPherson has used, of local and through, that would not be the case would it?

A. It would not be the case to such an extent, Judge Hill; but I think even using the division he uses would assign a greater proportion of expense to the state than is assigned by the consolidation plan.

Q. I notice, Mr. Nay, you and Mr. Ludlam have differed very widely as to the application of the revenue theory, and have exchanged compliments on the question of whether a "snow man" has been set up and knocked down. I would not question you doctors of accountancy on a proposition of that kind, but I just want to ask you this:

As I understand your testimony, in the final analysis the revenue theory has to be supplemented by the testimony of operating men as to the cost of intrastate over interstate operation, so what need is there to use the revenue theory at all, if the testimony of these operating men is to determine the final analysis.

A. Well, the revenue theory is needed to make the first sepa-

4763 ration of operating expenses between state and interstate traffic.

Q. If that is going to be determined upon the opinion of the operating man; why need to make that separation?

A. I do not see how you can figure it out without some basis of separation.

Q. But the separation, after it is obtained, as I understand it, is of no value until supplemented by the opinion of operating men: Is not that the substance of it?

A. That is Mr. Ludlam's opinion. It is not mine.

Q. I am asking if that would not be the substance of your opinion, where you say you have supplemented the division on the revenue theory by the testimony of the operating men?

A. Well, I don't understand Judge Hill, just what you refer to. I stated in the very beginning, I guess it must be six months ago, that there could be no actual separation between state and interstate of operating expenses, for the reason that the traffic is carried on the same trains and in the same cars by the same train crews, handled by the same agents and same laborers, over the same track, and all that sort of thing; so it could not be actually separated.

But some traffic costs more than other. Some kinds of traffic—that is some kinds of state traffic; carload traffic costs less than less than carload. Short haul costs more than long haul.

The revenue reflects those different conditions of cost and
4764 therefore, the revenue basis was the better basis or the best basis, because I know of only three, for making the first separation, before adding the extra cost,——

Q. Now, if you will allow me to interrupt you there, my point is this:

If the question of ultimate cost of state over interstate is to be finally determined by these operating men, why not settle it arbitrarily by three times or five times. What is the use of separating it on a factor you are not going to use?

A. You have to have something. You say "five times as much" and you cannot say five times as much without something on which to base that.

Q. You stated in your testimony that they did not base it on the revenue but just said "five times as much" from their standpoint. They are not using the revenue basis, are they?

A. No, sir. As I said, candidly, they are thinking of the tons and ton miles.

The tons cannot be used because that does not take into consideration distance at all. The ton basis takes into consideration only the weight.

The ton miles adds only one more element, and that is distance. The revenue basis combines all the elements of cost for getting the original sub-division. There must be an original sub-division because you cannot say five times as much without saying five
4765 times as much as something.

Q. You say they are not using the revenue basis, and they are saying five times that?

A. Yes, sir.

Q. And as I understood your argument for the revenue theory,

it took, either consciously or unconsciously, the question of cost into consideration?

A. Yes, sir.

Q. If cost is not taken into consideration you have to depend upon the opinion of these operating men; and if cost is already taken into consideration why do you need to do that; isn't that a fact?

A. If the entire difference in cost was taken into consideration in the rates, yes that would be a fact.

Just as I said in my testimony, if in the commercial business a thing costs three times as much as another, it should sell for three times as much.

If the state business costs five times as much as interstate, and the receipts are five times as much, of course, that would end it.

Then the revenue basis would be conclusive, without any additions.

Q. But the point you make is that the cost has been taken into consideration but it has not been sufficiently taken into consideration: is that about the idea?

A. That is the idea. Due very largely——

4766 .Q. This deficiency of the cost is a question that must be supplemented not from any records but from the opinion of operating men?

A. Yes, sir, from the opinion of operating men, and that deficiency of cost is not taken into consideration because the rates have been reduced or fixed—in many cases by statute or Commission, without any refrence to the cost at all.

Q. And by commercial conditions and competitive conditions, without any reference to cost at all?

A. I would not say "without any reference to cost, no, sir.

Redirect examination.

By Mr. MOORE:

Q. Mr. Nay, what was the main object of the classification of railroad accounts prescribed by the Interstate Commerce Commission: was it not to bring about uniformity in railroad accounting, more than anything else?

A. That I think was the prime object, to bring about uniformity.

Q. Counsel for the state questioned you in connection with the lap-overs from month to month, in the freight handled, and the manner in which such accounts are kept of the freight movements in the Auditor's accounts.

He assumed state and interstate freight moved co-incidently, and asked you questions based on that assumption:

4767 I wish you would look at the statement filed by Mr. Roth in this case yesterday of freight traffic on the Missouri Pacific System, as a whole; and the Iron Mountain intrastate in Arkansas, by commodities, showing the tons one mile and the revenue earned and the percentages of the total. That is the heading of it.

State from an examination of that exhibit if it is true that com-

modities moved coincidently in state or interstate traffic, or in the state of Arkansas, intrastate, called "company traffic"?

You will find this column to which I call your attention is the percentage of the different commodities on the system, and over here (indicating) is the percentage of interstate business.

A. No, sir, the percentages are quite different.

As for example, the percentage of total tons one mile for the system of grain is 13.43% of the total of all commodities; while the intrastate tons one mile in Arkansas of grain is only 1.56% of the total of all the intrastate commodities in Arkansas.

All the way through there are similar disparities between the percentages of the tons one mile for each commodity for the system and the percentage of tons one mile in Arkansas.

Q. From a comparison of the percentages that appear upon that sheet, what is your judgment as to the coincident movement of the system and intrastate traffic in Arkansas?

4768 A. I would say they do not move in the same relative proportion.

Q. Mr. Nay in the investigation that has been going on before the Interstate Commerce Commission and in which you testified and prepared some statements to which your attention has been called on cross-examination, the railroads were contending, weren't they, that the expense of handling traffic has been continually increased for a number of years?

A. Yes, sir.

Q. And that it had increased out of proportion to the revenue—that is, more largely?

A. Yes, sir.

Q. That was the matter of contention there?

A. That was the basis of their contention, Judge Moore.

Q. And the statements to which you referred covered several years?

A. The statements I submitted covered 13 years.

Q. As I understand the particular purpose of that was to show that the expenses had been increasing during that period more largely than the revenue had increased?

A. Yes, sir. Those statements showed, briefly, this: That from the beginning of the period up to the year ending June 30, 1907, there had been increases in expenses all along due to increases in wages, increases in prices of material, that were offset very largely by increased train haul and increased carload: that is, increased efficiency, so that up to that point, the railroads were able to over-

4769 come the increases in operating expenses by increasing their train loads and carloads; that is, increasing their efficiency. But that since 1907, during the last three years, the increase in operating expenses have gone on just the same, that is, wages have increased, but the increased efficiency seemed to have reached its maximum in about 1907, and the train load today is not much more than it was three years ago; and the carload is not much more.

On the Rock Island, as I recall, it is slightly less, in each case.

That being the case, the necessity for more revenue was apparent to meet largely the increases in wages.

Q. Had there been a recent increase in wages?

A. Yes, sir. Increases have been granted on the Rock Island within the last year that will aggregate more than $1,000,000 per annum increased pay to the employees.

Q. Would not the period of time you used, seven weeks, I believe, to which your attention was called, for the purpose of showing the relation of expenses to revenue, reflect to an extent that recent increase in wages?

A. Yes, sir. The seven weeks, however, Judge Moore, covered only revenue. We did not have the expenses for the last three weeks. We had the expenses for only one month, but the statement showed an increase of expenses of nearly $300,000 for the month of July, with a decrease in the revenue.

4770 Q. Did that reflect the effect of the recent increases in wages? I mean the effect of that increase in wages upon the revenue of the company?

A. Yes, sir, a part of that increase, but not all of it, was due to increase in wages. Part of it was due to the increase in the price of coal. We had a coal strike on, which was compromised about the first part of September—at any rate the early part of September, which resulted in an increase of wages to the miners that our operating men say will cause a permanent increase in the price of coal of about 15 cents per ton. That was their testimony in that interstate case.

Q. As I understand you, your purpose in introducing these exhibits was to show the relation between the increase in expenses, including the wages, prices of materials, and so forth, and the decrease in revenue of your company?

A. Yes, sir.

Q. It did not require a comparison between periods to do that. Did not the application of increased cost of your traffic, with the showing of the revenue made, demonstrate that or tend to do that?

A. Yes, sir. For instance, if there was an increase in the wages of switchmen, which there was, and which amounted to as I recall it something like 8%, you know without taking any period into consideration that the wages for switchmen after that are going to be 8% more than they were before, with no additional service and no additional revenue derived.

4771 The purpose of that exhibit for one month of July, for operating expenses, revenue, taxes and so on, and for the three weeks, was to offset the statements that were being made that the country was now in such a prosperous condition that our earnings were ample for all our needs.

And I was giving the information up to the very latest available date to show that was not the case with the Rock Island.

Q. Were statements of that kind furnished by all the lines concerned in that investigation?

A. I do not recall. I was not present at all of the hearings.

Q. You do not know about that?

A. No, sir.

Q. You stated on cross examination that the Interstate Commerce Commission had taken the months of March and September for some purpose in connection with revenue:

What was that statement? I do not recall it exactly?

A. That was a statement in connection with this interstate rates case, where we compiled figures showing increase in revenue due to the proposed rates.

You understand the railroads had proposed to increase certain rates on commodities and had filed their tariffs with the Interstate Commerce Commission, showing those increases. Those tariffs were suspended pending this hearing.

The railroads were continuing to charge the old rates.

4772 What we did was to take the business of those two months, September, 1909, and March, 1910, and draw it all off in detail, from and to stations and apply the old rates that were in effect at that time and compute those in one column and then apply the new or proposed increased rates and compute that in another column; and subtract one from the other, to find out what the increased revenue would be, assuming that the shipments would have moved just the same under the increased rates as they actually did under the old rates.

Q. Is there any other way you can get at the increase in revenue?

A. No, sir. No other way by which it can be done, accurately.

Q. You stated on cross examination that the revenue does not represent the expense of maintenance of way, any more than the car miles:

Do you mean by that to say that that expense is not represented by either?

A. Yes, sir, I mean that neither one causes the expense.

Q. That class of expense is shown by the evidence in this case to grow largely out of causes other than operation: The testimony shows that 75 to 90 per cent of it is caused by the elements and other independent causes:

Now, in that view there is no connection or relation between that and car miles to the extent that it is not caused by operations.

That is true, is it not?

4773 A. Yes, sir.

Q. You have already stated that?

A. Yes, sir.

Q. If it is true, it is more or less of an overhead expense rather than direct expense of transportation, is it not?

A. Yes, sir, I should think it might very fairly be treated as an overhead expense.

Q. If you had to divide it on some other basis I believe you stated it is your view it should be divided on the revenue basis?

A. Yes, sir.

Q. But if you had to plan some other basis than the revenue, what basis would you take? How would you treat it?

A. My second choice would be to treat it as an overhead expense and divide it on the basis of the direct expense.

Q. I believe you stated that the last half of the year produces larger returns than the first half?

A. Yes, sir, that is, the last half of the calendar year.

Q. You mean the last six months of the calendar year?

A. Yes, sir.

Q. If you were undertaking to ascertain the results of a year's business, and you had ascertained the business of the last half, would you say the first half of the fiscal year, running from July to December, would you think it proper to ascertain the net
4774 return for the year by doubling the return you counted for the first six months?

A. No, sir.

Q. You think allowance should be made for the difference in the return produced in the two different periods?

A. Yes, sir.

Recross-examination.

By Judge HILL:

Q. Please look at statement 3 (*b*) Exhibit 8, the corresponding one you will see is for the six months ending December 31, 1907, and the other is for the period ending June 30, 1907:

Please state the gross operating revenue and expenses for those two periods?

That is for freight, I understand?

A. This shows operating expenses, maintenance of way and structure and so on.

Q. It is summarized. Give the gross revenue and operating expenses?

A. This shows the gross freight revenue in the state of Arkansas for the Iron Mountain Railroad, for the six months ended December 31, 1907, $4,896,272.91.

Operating expenses, $3,253,034.86.

Net operating revenue, $1,643,238.05.

Q. Now turn to the corresponding figures in the other statement, Number eight.

4775 A. This shows the results for the Iron Mountain in the state of Arkansas for the six months ending June 30, 1907:

Freight revenue, $4,729,412.64.

Operating expenses, $2,795,474.37.

Net operating revenue, $1,933,938.27.

Q. Those figures do not agree with the opinion you expressed a few moments ago, do they?

Col. MOORE: Get the Cotton Belt figure before answering.

Judge HILL: Let us get through with one at a time.

A. What opinion do you refer to?

Q. That the last half was the better half of the year.

Col. MOORE: He would better have the other figure before him.

Judge HILL: He can have both before him.

Col. MOORE: Here are the Cotton Belt figures for the last half of 1907 and the first half of 1908.

Judge HILL: I should like that separately. Take up this one first:

What do you say to that?

A. (After examining figures.) That shows a greater operating revenue during the six months ending December 31, 1907, than during the six months ending June 30, 1907.

But it shows less operating expenses for the six months ending June 30, 1907, than for the six months ending December 31st.

Q. The net result was better on the first six months?

A. Yes, sir, that is true.

4776 But I do not think that would be true from year to year.

Q. Now you may put in the Cotton Belt figures if you wish:

What figures are you putting before him, Mr. Kimbell?

A. The last half of 1907 and the first half of 1908.

Judge HILL: That is the year the panic came on. You are not going to treat that as a normal period, are you? If you have the figures of the Cotton Belt for the first and the last half of 1907 I shall be glad to have you put them in; but I do not think that it is fair to put in the figures of the last half of 1907 and the first half of 1908.

Col. MOORE: If you would rather I did not have it go in now I will wait and ask him that later.

Judge HILL: You may have it in now, but I want to put in that objection.

A. It is the Cotton Belt revenue and expenses for the six months ended December 31, 1907 for the state of Arkansas:

Freight revenue, $1,795,355.49.

Operating expenses, (this includes taxes and rentals) $925,594.20.

The net in round figures $870,000.

For the first six months ended June 30, 1908 the similar figures would be:

Freight revenue, $1,431,374.07.

Operating expenses, $859,680.85.

The net being in round figures $572,000.

4777 For the six months ending June 30, 1908 as compared with the net of $870,000 for the six months ended December 31, 1907.

Q. Would you regard the first half of 1908 as a fair period to compare with?

A. I think about as fair as to take the last half of 1907 and compare it with the first half of the calendar year 1907, because the panic began the latter part of October, 1907.

Q. I understood from these operating men that it did not affect the freight business until along about the last part of December or January of the next year: is not that your information about it?

A. That is not my information on the Rock Island. On the Rock Island the slump showed up in November.

4778 HUBERT ROTH, recalled, testified as follows:

Direct examination.

By Col. MOORE:

Q. What is the mileage of the Missouri Pacific, including the Iron Mountain?

A. I have not the figures right here, Mr. Moore. I cannot say, off hand.

Q. You will put that in?

A. Yes, sir, I will prepare that. It is about seven thousand miles.

Q. It is about seven thousand miles, is it?

A. Yes, sir.

Q. In what states does the system operate?

A. I think it is eight states.

Q. How far westward does that system extend from St. Louis?

A. As far as Pueblo, Colorado.

Q. What is the distance?

A. 903 miles, I think it is.

Q. How far does it extend in Nebraska, to Omaha?

A. To Omaha, but I do not think that is the furthest point. I think Prosser, Nebraska, is the furthest distance from St. Louis.

Q. What distance is that from St. Louis?

Judge HILL: Why do you not file a map, if you want to get in physical characteristics of the Missouri Pacific System?

4779 A. Prosser is 601 miles from St. Louis.

Col. MOORE:

Q. How far does the system extend west from Fort Smith?

A. West from Fort Smith? I have not the exact distance on that.

Q. State it approximately. I do not care whether it is exact or not.

A. From the Arkansas State line west of Van Buren it is 789 miles to Pueblo. That would be the longest distance.

Q. And how far from Fort Smith to Omaha, or the end of the line in Nebraska?

A. To Omaha would be 559 miles and to Prosser, Nebraska, 665 miles.

Q. Was there any mileage added to the Iron Mountain Railway in Arkansas between 1907 and 1909, inclusive, both years?

A. No, sir.

4780 R. E. KIMBELL, recalled, testified as follows:

Direct examination.

By Col. MOORE:

Q. I wish you would state what the mileage of the Cotton Belt System of railroads is?

A. I don't believe I can give you that accurately. About 1558 miles, as I remember it. That includes the Texas line.

Q. Is the Texas line a part of that system?

A. It is a separate corporation and operated separately.

Q. What is the line north of Arkansas?

A. The line north of Texas, you mean?

Q. No, north of Arkansas I want.

A. It is very little.

Q. I want to know what it is?

A. We operate 152 miles in Missouri and under joint trackage rights 138 miles from Thebes Bridge to St. Louis. That comprises all of the line north of Arkansas.

Q. That is your line from St. Louis to the Arkansas line?

A. Yes, sir.

Q. And that is all you have north of the state line of Arkansas?

A. Yes, sir.

Q. Is that a compact system or is it a scattered system?

A. I should call it a small system and somewhat compact.

Q. How does it compare in compactness with the Missouri Pacific System?

4781 A. It is vastly different.

Q. Is the Missouri Pacific System compact or scattered?

A. The Missouri Pacific System, as shown by the map, is a very scattered system.

Q. How many states does the Cotton Belt System operate in?

A. Illinois, Missouri, Arkansas, Louisiana, and Texas; five states.

Q. In Illinois and Missouri is the line from the northern border of Arkansas to St. Louis, Missouri?

A. Yes, sir.

Q. And that part in Illinois is where it crosses the Thebes bridge?

A. Yes, sir.

Q. You have filed an exhibit in this case, showing the earnings and return on the Cotton Belt property in Arkansas for the last half of the year 1907:

How would the return for that part of the year on that line compare with the entire calendar year of 1907, in your judgment?

A. We had no——

Q. You are unable to compare them?

A. No, sir, not without a great deal of labor.

Q. From your knowledge and information in the Auditing Department of that road, what is your judgment as to how it would compare?

A. I am familiar in that respect with the net earnings.

Q. Well, the net earnings?

4782 A. The net earnings for the last six months of the calendar year on our line, approximately, under normal conditions, is 20% greater than the net earnings for the first six months.

I will say approximately, because I have no definite figures on that subject right now.

Q. Has there been any addition made to the mileage of the Cotton Belt line in Arkansas since 1907?

A. No, sir.

Q. Exhibit G filed by you, I think at the request of the state, showed an increase of 96.1% in interstate revenue between January, 1909 and the six months ending December 31, 1907, which was explained by you as due to the shifting in the character of the tonnage handled, and as not brought about by a change in the rates:

Have you prepared a statement showing the revenue under the current rates from November 1, 1908 to January 1, 1909, and the Commission rates?

A. I have.

Q. Will you file that as an exhibit in this case and make any statement you wish in explanation of it?

A. Yes, sir.

Col. MOORE: We offer in evidence the statement prepared by Mr. Kimbell.

The paper referred to is marked "Complainant's Exhibit 58."

Said paper is in the words and figures following to-wit:

4783 For Exhibit 58, see Volume 8, page 5742.

A. I have heretofore given some testimony, and testimony has also been given by others, to show that the increase in the average revenue per ton per mile is not absolute evidence of an increase in rates. That this average could change materially, due to the shifting in the character of the tonnage handled, without any change whatever in the rates.

And that there was a material change in the character of the tonnage handled in January, 1909, as compared with the six months ending December 31, 1907.

The exhibit now filed as Exhibit 58 is a statement showing the revenue from intrastate freight and passenger traffic, under both current and inhibited rates from November 1, 1908 to December 31, 1909.

The temporary injunction in this case was granted September 3, 1908, and this company put in new rates as early as practicable thereafter; the three cent passenger rate going into effect on October 19, 1908 and the freight tariffs on November 1, 1908.

By reference to this exhibit it will be noticed that for the month of January, 1909, which was the month Judge Hill decided on when he requested me to prepare Exhibit "G," the revenue actually received on the intrastate freight traffic handled in that month was 13916.26.

The application of the inhibited rates to the actual traffic movement for that month showed that the revenue would have been, under the inhibited rates 20,863.89;

4784 The increase is 10,052.37 or 48.18%, which it will be noted is about one-half of the percent which Judge Hill directed me to prepare Exhibit "G" on.

The correct way to determine the percentage of increase in revenue for the six months ending December 31, 1907 had the rates in effect in January, 1909, been in effect during those six months, would be to apply the latter rates to the actual movements for the six months'

period; and figure the increase in the revenue so obtained over the actual revenue.

On account of the magnitude of the task this has not been done. However, under order of the Court this company is keeping a record of the amounts collected under the current freight and passenger tariffs, pending a decision in this case, and by applying the inhibited rates to the actual movement for each month we are able to arrive at the actual revenue increase and the percentage of increase, of the results under the "current" over the "inhibited" rates.

It will be noted that for the month of January, 1909, the percentage of increase is 48.18.

Even this percentage is no doubt greater than the percentage would be based on the application of the railroad rates to the actual movement for the six months ended December 31, 1907. I think the percentage Judge Hill should have used was about 48.

4785 Judge HILL:

Q. What I was interested in is something you do not seem to have there, is the relation between state and interstate. Have you anything on that?

A. I do not know that I could induce our management to spend enough money to make up the interstate on two bases.

Col. MOORE:

Q. Mr. Kimbell, you have a statement there which shows the increase for the six months beginning June, 1909, under the court tariff; that is the time that tariff took effect; as compared with current rates and the inhibited or commission rates.

What is the average increase shown by that statement for six months?

A. The average increase from June, 1909 to November, 1909, was 29.61%.

Q. And what was the average increase for six months from November 1, 1908, which covered the first six months after the voluntary railroad tariff went into effect?

A. You will notice that is seven months.

Q. Yes, I see it is.

A. The average increase was 46.83%.

Q. How much is the increase in passenger?

A. The passenger, under the three cent rate from November 1, 1908, to December 31, 1909, a period of 14 months, was 37.20%.

Q. Is there anything else you wish to state in connection with that exhibit?

4786 A. No, sir, I think it is self-explanatory, to a large extent.

Q. Have you prepared a statement of loaded trans-state cars moved through the State of Arkansas, for the first 15 days of October, 1908?

A. I have, yes, sir.

Q. Will you file that as an exhibit in this case?

A. I will.

Col. MOORE: I will offer in evidence the statement referred to which was prepared by the witness.

Said statement is marked "Complainant's Exhibit 59."

Said Exhibit is in the words and figures following to-wit:

For Exhibit 59, see Volume —, page —.

4787 Col. MOORE: Make any statement you wish in regard to Exhibit 59, Mr. Kimbell.

A. Mr. Hamilton for the state, made an investigation of the time consumed in moving trans-state cars through Arkansas on the Iron Mountain road; but made no investigation on the Cotton Belt.

I have, therefore, prepared a statement of loaded trans-state cars moved through the state of Arkansas for 15 days from October 1st to October 15, 1908, October being the month in which the test of train cost was made by this company; showing the actual time consumed within the state of Arkansas as compared with the scheduled time of trains.

This statement shows a total of 934 cars southbound, of which 433 moved from the Missouri border on the north to the Texas border on the south, a distance of 349 miles and an average of 28.2 hours each, or at an average speed, including all stops en route, of 12.04 miles per hour. While the scheduled time is 25.6 hours or 13.6 miles per hour, including all stops.

114 cars moved from the Missouri border to the Louisiana border, a distance of 344 miles in an average of 30.4 hours each, or at an average speed, including all stops en route, of 11.3 miles per hour; the scheduled time being 25 hours, or 13.6 miles per hour including stops.

4788 40 cars moved from the Missouri border to Stamps, Arkansas, for delivery to the Louisiana and Arkansas Railway, a distance of 315 miles, in an average of 26.9 hours each; or at an average speed including all stops en route of 11.7 miles per hour. While the scheduled time is 22.8 hours or 13.4 miles per hour, including all stops.

120 cars moved from Fair Oaks, a junction for our Memphis freight, to the Texas border, a distance of 246 miles in an average of 19.1 hours each; or at an average speed including all stops en route of 12.9 miles per hour, while the scheduled time is 13.8 miles per hour, or 12.9 miles per hour including all stops en route.

The item under southbound, reading "from various" "to various", in Exhibit 59 represents 277 cars coming on and going off this line at various junctions; the average time consumed being somewhat less than for the cars heretofore mentioned, which were handled in a practically continuous movement.

The bulk of this movement is lumber from Louisiana and Arkansas Railway at Stamps, destined to and via Texas points; the movement on this line being but 34 miles. And the delay apparently due to slow local train service.

The northbound movement consists largely of lumber, which is not given a preferential train service according to the southbound trains, much of the latter being of a perishable nature.

This exhibit particularly the southbound movement, in my judgment, corroborates the testimony of Mr. Doddridge, regarding the movement of trans-state freight over the state.

4789 Q. What was that statement?

A. It was, in substance, that it moved without any extra terminal handling in the state, as a general proposition. There are exceptions, of course, to it.

Judge HILL:

Q. You have not a bridge on the Cotton Belt? Is that the idea?

Col. MOORE:

Q. Counsel for the state has called your attention to a statement made in your evidence to the effect that October, 1908, the month in which a test was made on your line, would represent relatively the difference between interstate and intrastate traffic: You recall the reference to this which counsel made? Do you wish to make any statement in connection with that?

A. The testimony I gave in direct and cross-examination concerning the test made on this road in 1908 has been frequently quoted by the state in connection with its action in using the figures for October, 1908, in apportioning expenses for a six months' period.

I do not know whether I have been misunderstood in this matter or not, but I would like to make my position plain.

This test was made for the purpose of determining the cost of the labor and fuel on local and through trains and the relative handling of state and interstate business on each class of train.

As I stated in my direct and also on cross examination it was a very laborious task to make this test, and to cover a period of more than one month would be almost prohibitive, on account of

4790 the labor and expense required to do the work.

I testified in direct examination that so far as this test was concerned it would represent relatively the difference between the two classes of traffic. I also testified on cross examination that I thought for the purpose of a test of that kind, to determine the relative difference between the two classes of freight, one month was perhaps as good as another. And that under almost any conditions, good times or bad times, the relative difference between the two classes of freight would travel uniformly. In other words, if we are going to have poor businss it is going to affect both classes of traffic.

I did not intend to convey the impression, nor do I think the testimony indicates that I did, that the month of October or any other month would fairly represent the character and volume of business for the period of six months or a year.

One month may reasonably be taken as a guide in determining the relative amount of state and interstate freight handled by the two classes of trains. And for that purpose it would seem, perhaps, that one month is as good as another.

The results of this test are embraced in Exhibit- 19 and 20 as illustrating the relative cost per ton per mile, intrastate and interstate, for

wages and fuel, and are not used in any of the other computations included in other exhibits filed by this company.

Q. You ascertained the actual amount of freight carried
4791 on each class of train?

A. Yes, sir.

Q. You did not arrive at the tonnage hauled by the through trains in the manner used in the exhibits prepared by the state?

A. This test was the actual tonnage handled on both classes of trains, local and through, from the first day of the month to the last, irrespective of the dates of the waybills.

Q. Mr. Kimbell, have you prepared any exhibits showing what result would be produced by the application of the theories contained in the state's exhibits "R" to "V" inclusive, with modifications on the basis of the testimony of the operating men introduced by your company in this case?

A. Yes, sir, I have.

Q. Will you file that statement?

A. I will.

Col. MOORE: We will offer in evidence the statement referred to.

The statement referred to is marked "Complainant's Exhibit 60."

Said Exhibit is in the words and figures following to-wit:

For Exhibit 60, see Volume 8, page 5746.

4792 Q. Mr. Kimbell, I have asked Mr. Johnson in detail to explain the changes that were made by him, and I suppose the changes made by you were made in the same way: that is correct, is it not?

A. Yes, substantially so, with one or two minor changes.

Q. And you have sought in the changes you have made to apply the modifications which you think have been shown by the operating men, that should be made in the state's theory?

A. Yes, sir.

Q. I will not ask you to make any detailed explanation of this exhibit, as I understand it will be practically the same as that made by Mr. Johnson in connection with the Iron Mountain exhibits.

By consent the cross-examination of the witnesses R. E. Kimbell, Hubert Roth and F. P. Johnson is deferred until such time as the sur-rebuttal testimony is taken.

[End of Volume II.]

(22,889.)

SUPREME COURT OF THE UNITED STATES.

OCTOBER TERM, 1911.

# No. 813.

# VOLUME III.

No. 813.

ROBERT P. ALLEN et al.
vs.
THE ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY.

4793 WALTER NASH, being first duly sworn and examined, testified as follows:

Direct examination.

By Mr. HILL:

Q. Will you state your name, age, residence and present occupation?

A. Walter Nash, 32 years old, in the real estate department of Mercantile Trust Co.

Q. Residence, Little Rock?

A. Yes, sir.

Q. Have you had any railroad experience?

A. Yes, sir.

Q. I wish you would state what it has been, just give a history of your experience.

A. My first experience was watching the bridge at the Iron Mountain bridge here, letting teams backwards and forwards, and I don't remember just how long I was there; I believe I went from there to firing an engine on the Iron Mountain, and I fired an engine for about nine months, and I went to the Rock Island, and went to braking, and I was promoted to conductor; I broke about three or four months, something like that, possibly longer than that, and then I was promoted to conductor, and given charge of steam shovel and construction work on the Eastern Division.

Q. What road was that?

A. The Rock Island. I was at construction work about 18 months, and then put in the freight service; I think I was
4794 in the freight service three or four years, something like that.

Q. As conductor?

A. Yes, sir. And then I went into the passenger service, and I was in the passenger service about two or three years, I don't remember just what, as conductor.

Q. Is that all of your railroad experience?

A. Yes, sir.

Q. With what roads has that experience been?

A. Been with the Iron Mountain and Rock Island; it was the Choctaw & Oklahoma & Gulf then.

Q. Now the Rock Island.

A. Yes, sir.

Q. Your experience was all in the State of Arkansas?

A. Yes.

Q. How many years of that experience was with the Iron Mountain and how many with the Choctaw, if you can recall approximately?

A. I guess there was about in the neighborhood of six years with the Rock Island, and altogether, the time that I worked for the Iron Mountain, I was off and went back to work for them again—I guess it was about four years; I am not certain about that; that has been a long time ago, and I don't keep track of those things very well.

Q. I just wanted to get an approximation of your years of experience with each road; when did you leave the railroad experience?

A. I think it has been about five or six years ago.

Q. Prior to 1907, was it?

4795 A. Yes, sir; if you want those dates, I think my old train books and other things, I could dig it up.

Q. I don't care about that; I just want to show your experience; you left prior to 1907, did you?

A. Yes, sir.

Q. We have got a question in this case of a division of expenses between local and through freight trains; in making the division, the State in its Exhibit allowed 50% extra mileage for the switching done by local trains, or in other words, if the local ran 100 miles 150 miles was counted, taking 50 miles as consumed in switching.

Mr. Gray, one of the witnesses for the railroad, testified in rebuttal that was not sufficient allowance for switching done by local trains. I wish you would state your opinion based upon your experience as to the proper allowance?

A. I would judge somewhere between 25 and 50%, not over 50%.

Q. I wish you would explain why it is that you have reached that conclusion; explain your process of reasoning in reaching that conclusion; of course, I am asking all these questions based on your experience.

A. Yes. Well, you take, as I understand now,—I am a Rock Island man; I never ran a train on the Iron Mountain, but you take over there, an average freight run will run somewhere between 12 and 16, may be 17 hours a day; we were supposed to work 16 hours before we would tie up; in case we were somewhere near a terminal, or near through with our work, we would not mind putting

4796 in extra time; we would not tie up at any point; we would want to get somewhere where we could get food, and have a place to rest before we tied up.

Take a local train, say on a 100 mile run, you could figure the time in there, it would run something like 50%. In this time you would lay out, you are the most inferior train on the road—you

have got to get out of the way of everything and you lay in the siding, waiting for other trains to go by, and you have got to help other trains out when you are called on to do it.

You take on our run, the biggest part of our switching was at Brinkley. In switching, however, you never go very fast switching, and you take the time allowed for switching, a man walks when he is switching; he doesn't ride many cars; he goes into a terminal where he is going to do switching, and gets his switch list from the agent, and he has got to send his brakeman out to spot the cars where they are on the different side-tracks and different industrial tracks, and that takes considerable time, and the engine is standing still all this time, and then he figures out his scheme of switching and goes to work and does his switching.

I would say that the time that an average crew allows for looking over his switch list and spotting the cars for the amount of switching—that takes about as much time as the engine actually works.

Q. What speed does the engine usually travel in switching?

4797 A. I shouldn't think it would average over 5 miles an hour.

Q. You have stated these causes of delay, and the speed of your switching engine in switching; now I ask you how you apply that in making your estimate of from 25 to 50% of extra switching by local trains,—extra mileage in switching by local trains?

A. Let me figure it here a minute.

Q. Explain it out; we are after the reasons more than the actual facts.

A. When it comes to figuring percentages, I have to figure it over a little bit—take a through train——

Q. Through or local?

A. We are comparing the two?

Q. No, just cut out the through.

A. We will take a 100 mile local run, and we will say it will run 20 miles an hour between stations; that would be 5 hours it would be allowed to get over the division, if it made no stops anywhere; now we take that 16 hours you are on the division, somewhere between 12 and 17, we will say 16—that would leave 11 hours that you would be doing something else besides running on the road.

I would have to study to see about the delays there, but there is 11 hours difference right there; out of the 16 hours, there is 5 hours actual running time on the road; 11 hours' time, that is

4798 either delay, laid out by trains or switching, or taking water or coaling the engine or engine failures. There is 11 hours there. To get at the percentage there, between that and actual switching time, I would judge about somewhere in the neighborhood of half of that 11 hours would be switching, and the other half from laying out by trains and engine failures, and helping other trains out on the road, and such things as that.

I would put in half of the 11 hours say——

Q. And to get the mileage, do you use the speed you have testified to,—five miles an hour?

A. Yes, sir. There would be five hours and a half of actual switching time at 5 miles an hour, would be 27½ miles that I would switch on the 100 miles.

Q. Is that illustration you have given, a fair illustration of an ordinary run of a local freight?

A. Yes, sir, I believe that is fair.

Q. I mean an average; of course, I understand from this case there would be exceptional cases.

A. Yes, sir, averaging up for spring and all the time——

Q. That would be your judgment of a fair average?

A. Yes, sir.

Q. Mr. Gray testified in regard to this, on page 703, that in his judgment that no one could tell what would be a proper amount. and that he had no method of arriving at a proper amount of switching for a local freight. I will ask you what you think of that, as to whether that is correct—or whether in your ex-

4799 perience in handling local freights, there is, you think, a fair average that can be made?

A. I believe a fair average can be made. I think any man that has run a freight train until it becomes a kind of second nature to him—there is lots of things about running a freight train that a man really couldn't think of them all; his orders and his switching and his little bills here, and his shorts and overs yonder, and everywhere; it is kind or drilled into him until he does lots of things automatically; that is the way it seems to me; I believe a man could get this average very well; a man gets it drilled into him until it is a *man* of second nature.

Q. In other words, he knows what he does on a local freight train?

A. Yes, sir.

Q. Now, Mr. Ward puts the same proposition, page 609 of this thing—"No operating man that I know of could determine with accuracy as to whether that division was correct or incorrect"—that is referring to this 50%.

I will ask you, who, in your opinion, would be the best man to determine the matter of this kind, the general manager of a railroad or the man who is running the local freight?

A. I believe the man on the ground would be the best one.

Q. With all due deference to the general manager?

4800 A. Yes, sir, with the highest respect in the world to him; we are taught that too all along the line.

Q. You are taught that?

A. It kinda becomes nature to respect our officials.

Q. These general managers, I will say for the benefit of the record, are most excellent gentlemen; you think that no matter how excellent these gentlemen may be, that the local freight man would know a little more about it?

A. I believe the local freight man and the man on the train, is better familiar with all conditions than anyone else. I think the same is true of either freight or passenger men.

Q. In making up the exhibits in this case, and dividing the ex-

pense between local and through trains, the State allowed a stop every five mile for a local train and every twenty for a through, and made certain statistics based upon that.

The railroads have put in an exhibit which is #56, in which they use the same method of arriving at this cost, but take eight times—that is, that the local train stops eight times to where the through stops once, as against four to one used by the State.

I want to call your attention to this matter of the eight times and ask you, if in your opinion that eight times, stopping of local trains, is a fair estimate. I believe you have testified you have had experience on both local and through?

4801 A. Yes, sir. I figured on two runs I once ran on; I am just figuring on a local run from Madison to Little Rock, and the fast freight train from Madison to Little Rock, and I find that the local run would average about 15 stops between there and Little Rock or Argenta, and the other one would run about eight stops.

Q. How does that run out; just complete your calculation?

A. That will run out—the local would be 8/15ths.

Q. Figure it—8 to 1 or 5 to 1 or 4 to 1.

A. If I would stop the local another time, and make it 16 times, it would be 1 to 2.

Q. You would not agree*d* with this 1 to 8?

A. No, sir.

Q. You say that was on two runs you made?

A. Yes, sir, that I once ran myself.

Q. What is your observation and experience of those two runs, compared with the ordinary run of state and through trains in the ..ate of Arkansas?

A. The locals just about average up; in the winter time, you would make, say four more stops on that run; in the summer time, you would lose four may be, because you understand the business is heavier; that is about the way I figure it up.

Q. You have taken that, averaging it up one season to the other . the local?

A. Yes, sir, and for the through train; that is for one through train only.

4802 That is the best train they had at that time; I believe the first number of the train was 9, and then it was changed to 31, and then to 83; that is their fast train.

Q. You contrasted the local with their fastest train?

A. Yes, sir.

Q. There is a lot of other throughs——

A. If you would rather, I will tell you how I get at this?

Q. I want you to make a full explanation.

A. I started in at Madison with 83; the first thing, we doubled the hill; most always in those days, we doubled the Forrest City hill.

Q. That is 83, your through train?

A. Yes, sir; we got to Forrest City, and we set out from 1 to 4 ars there, for Forrest City. We got to Goodwin and *take* water;

we got to Brinkley and set out from 1 to 4 or 5 cars, along there somewhere; we go to Biscoe and meet #4; it was then going east—taking the siding for the passenger train, and then we would take water at Hazen sometimes; we generally stopped in there somewhere to get by a train; we couldn't meet a train at De Vall's Bluff; we would stop at Biscoe or somewhere in there; then we stopped again, sometimes at Lonoke for orders, but I don't believe I counted Lonoke; I think my next stop on the train would be the crossing out there at the Dixie Mill.

4803 On the local, I started in at Madison, and I stopped at Forrest City, and I stopped at Palestine, and I stopped at Wheatley, and I stopped at Brinkley, and I stopped at Biscoe, and I stopped at De Vall's Bluff, and I stopped at Hazen, and I stopped at Prairie Center or Cuneo, and I stopped at Carlisle or Lonoke, and I stopped at Galloway or Dixie Mill, making 16 stops.

Q. Go back to the question as to whether these runs you have just given, of local and through, would be fairly representative of average conditions in Arkansas, according to your experience?

A. If all the through trains were as good as #83, this high ball train, that would, but that is the very best through freight train they have; they don't ever have a train going east as good as this.

Q. Conceding for the purpose of this question, that all the trains make the time, and there is no more stops than on their best train—put it on that basis?

A. I think this is fair then; I think that is a fair estimate between the two trains.

Q. Do you think those conditions would apply on the Iron Mountain and Cotton Belt?

A. I shouldn't think it would vary much; I have never run a train over there; I don't want to take the responsibility to say what the other fellow does, but I would judge that would be right.

4804 Q. You fired an engine on the Iron Mountain?

A. Yes, sir.

Q. I have assumed in that question, and you have in your answer, that all the through trains would make the same time that that fast train made, and make no more stops than that fast train; is that a true condition?

A. No, sir, as I said, this is the very best train we had in those days, on the Rock Island; the opposite of that, say this is 83; the other train east was 84; it was supposed to be as good a train as this; it had the same rights on the time card; it didn't have as many loads; this was all loads; no empties on this train at all; on the same train going east, it was supposed to be as fast a train, sometimes we would have three-fourths of the train empties, to peddle out at different places.

Q. A great many stops?

A. Yes, sir.

Q. Are you familiar with Train #55—the Texas Red Ball on the Iron Mountain?

A. Not very.

Q. You know what the train is?

A. I know what it is supposed to be.

Q. What is it supposed to be?

A. Supposed to be their fast train; the same thing that 83 would be on the Rock Island; you understand I don't want to mislead anyway here; where I get my ideas about different trains, is just through association with other railroad men; we met in the
4805 same division point, and about the only sense a railroad man has got, is railroading, and that is what we talked about.

Q. I am asking you generally, your knowledge of this train and from your railroad experience, how it would be handled; I understand you to say it would be handled on the Iron Mountain like #83 would be handled on the Rock Island?

A. Yes, sir.

Q. In other words it is the fastest train that either of those roads run?

A. The fastest freight train.

Q. I expect our Iron Mountain friends would claim #55 was better than #83 and our Rock Island friends might claim #83 was better. I am just using those two as types of the best trains they run, not asking you to compare them.

In the testimony of Mr. B. W. Moore, he was yardmaster of the Iron Mountain, he puts in an exhibit in this case, #55, I believe it is, showing how this Red Ball train moved through the terminals; puts that in as type of their through traffic, and based upon his exhibit he testified in substance, as I recall it, that the through trains get very little handling in terminals.

I wish you would give your opinion, first, as to whether the handling that one of these Red Ball trains would get in a terminal is a fair test of what a through train would get in a terminal; all
4806 through trains, I mean?

A. No, sir.

Q. Explain your reason, we want reasons more than the calculations.

A. Take 83 again; that is supposed to be made up in station order all the way through; for instance, when we get to Forrest City, we find a number of cars to set out there; we find them on the head end next to the engine; we had to make a drop of those cars at Forrest City; when we get to Brinkley, we would find cars for Brinkley next to the engine again; that made it convenient to switching.

When we got to Little Rock, we would know by our train book, in making out our switch list, that all the Little Rock cars were next to the caboose; they were made up that way in the yards at Memphis by the switch engine. I believe I would say about 50% somewhere about there—better make it 40% of the cars, of the remainder of the train, would be set out here, and then there would be 60% to go through; that 40% would be placed next to the caboose; they would be placed together in the train, so that one switch would throw these out. In the balance of the train, there would be cars for Howell, Oklahoma City, Shawnee, and different points up there—Haleyville. They would fill that train out with what

cars we would set out at Brinkley, and Forrest City; that would cut the tonnage down about half; well, they didn't pull as
4807 much tonnage on the west end as they did on the east end, they would put in half as many cars as they would set out—just about that; some of those cars would be for Haleyville, some for Howell, some for Shawnee, and some for Oklahoma City, and the switchman would take the switch list, and he would be supposed to be in the train—for instance, he had a Haleyville car in the middle of the train; he could tell that from the switch list I gave him; he would know that on track so and so, he had a car for Haleyville, and that he would have to put them together, and that he had a car for Shawnee on the switch list and two or three other cars over here for Shawnee, and he would get them together.

That train would not be a fair train then, because you take most of our other through trains over there, sometimes they are made up in toto right here in the terminals.

Q. You would not think that these fast Red Ball trains would be a correct type and their performance would not be a fair representation of the terminal handling that cars get?

A. No, sir.

Q. From your observation and general information as a railroad man, would you say that the explanation you have given of that Red Ball on the Rock Island, would be true in more or less degree of this Red Ball on the Iron Mountain or any other railroad operated in Arkansas?

4808 A. I should think it would be somewhere in the neighborhood of correct.

Q. Did you ever have switching service—I don't remember what you stated in your evidence?

A. I learned how to brake switching,—I didn't draw no pay for it; I was what they call a cub in those days.

Q. You know something about switching cars?

A. Yes, sir.

4809 Cross-examination of Mr. NASH.

By Mr. MOORE:

Q. When did you say you quit the railroad service?

A. I think it was between five and six years ago.

Q. That would be in 1904 or '5?

A. Yes, sir.

Q. Do you remember when you first went onto the Choctaw which is now the Rock Island?

A. It was first the Choctaw and Memphis and then the Choctaw, Oklahoma and Gulf, and then the Rock Island.

Q. You began braking on that line?

A. Yes.

Q. When was that?

A. I am unable to give you that. I began working on the old mud line, just after the old Choctaw bought it.

Q. That was 1898?

A. They hadn't connected up their line with the west; I had been on there about eight months when they connected up.

Q. What character of work did you begin with? Braking?

A. Yes, sir.

Q. I believe you said you were engaged in that two or three months?

A. Yes, sir.

Q. Then you were put on the steam shovel?

4810 A. Yes, sir.

Q. How long were you engaged in steam shovel work?

A. About 18 months, I believe, something like that; I dug up about 76 acres of ground about 20 feet deep, and put it out on the track.

Q. That was during the construction of the line west and re-construction of the Memphis line?

A. Yes, sir, I was on the re-construction.

Q. Then what was your next service on that line?

A. The next service was in freight service, running a freight train.

Q. Had the lines gotten connected up when you began running a freight train?

A. Yes, sir, they were connected up long before then.

Q. That must have been about 1899 or 1900.

A. I know I was still down in the mud when the new passenger cars came over, and I had the same awful bad track down there.

Q. How long did you work with freight trains as a conductor?

A. I don't remember; if you had asked me just after I quit railroading, I wouldn't have known; I could dig it up for you.

Q. At any rate, it was along in the early days of the Choctaw Oklahoma & Gulf?

A. Yes, sir, I ran a passenger train over there about two years,—must have been in the freight service about three——

4811 Q. And that would bring it somewhere to about—you quit in 1904 or '5?

A. Yes, sir.

Q. And you ran a passenger about three years?

A. Yes, sir.

Q. That would take it back to 1901 or '2, that your freight service continued?

A. Yes, sir.

Q. Had they gotten that Memphis & Little Rock Railroad repaired and completed at the time you quit the freight service?

A. Yes, sir.

Q. Just about that time wasn't it?

A. I was about the last man to finish up down there; when I finished up with my steam shovel, the road was in good shape then, and then I ran a freight train after that.

Q. How long did you run a freight train after the through traffic commenced over the connected lines of the Choctaw?

A. All my time in freight service was way after they connected up.

Q. That at that time, was practically a new road?

A. I believe it was then—six months after I took charge of the steam shovel construction over there, they had the trains running through; then there is another year I still continued in the steam shovel service at different points along there, and then I

4812 went in freight service, and I must have run a freight about three or four years.

Q. That line was opened up then, about the time or a little before you began freight service?

A. Yes, sir, about a year before.

Q. It was then prior to that time or had been just a short line from Memphis to Little Rock?

A. Yes, sir.

Q. And did very little business while it was in the hands of the receiver?

A. I don't know what it did; it was the Choctaw & Memphis when I went over there.

Q. The traffic on that road had not been fully developed while you were on it?

A. Our traffic was pretty heavy when I went over there, because we had a lot of material coming over it——

Q. I mean the revenue traffic?

A. I didn't know anything about that until I got in the freight service.

Q. How many revenue freight trains did you run—local trains—did you run each way, while you were running freight trains?

A. On the time card, we had a local each way a day, and two through freights a day, and that was all that was on the time card, and then most of the other was done by extras.

Q. How many passenger trains—just one each way, wasn't there?

4813 A. No, sir, I know we had two passenger trains each way, and I am satisfied we had three.

Q. Did you have a through train at that time, when you were in the freight service?

A. Yes, sir, through passenger service, we had two passenger trains each day from the west—Booneville and out there, and we ran a Hot Springs each way and then we had a local each way.

Q. That was three trains each way?

A. Yes, sir; I was still in the freight service then.

Q. The traffic on that line at the time you were there, was nothing like as heavy as it would be on the Iron Mountain?

A. I shouldn't think so.

Q. You never ran a train on the Iron Mountain?

A. No, sir.

Q. You stated and I will read your testimony—you stated on your run the biggest part of your switching was at Brinkley?

A. Yes, sir.

Q. There wasn't a great deal of switching done at those little side stations besides Brinkley?

A. Let me see; at Lonoke, we had considerable switching; we

had an oil mill and house track and gin; we had some private tracks that we switched quite a lot on, and De Valls' Bluff, we had lots of switching; we had an car factory and then other industries around there.

4814 Q. Besides those three places, there was very little switching?

A. I will call off the places that most of the switching was at; there was Lonoke and De Vall's Bluff, and Hazen came in there—sometimes we had a right smart of work to do in there; we will leave that out because that wouldn't be classed as heavy switching. Lonoke, De Vall's Bluff, Forrest City, Brinkley and Madison.

Q. How were the house track, side-track, passing track and industrial spurs arranged at those stations, take Lonoke for instance, just to illustrate it or Brinkley either one, I don't care which.

A. The house track and stock track were all the same at Lonoke, laid right by the side of the freight depot; I don't know whether I am getting at what you want or not,—and the oil mill—I don't know whether it was an oil mill or gin we had to work, and that laid up about two or three telegraph poles; and at Hazen, we had all straight tracks to work on there, and at De Vall's Bluff, that was a bad place to switch, most of the spur tracks we said nearly all of them ended in the river.

Q. Was there a house track at De Vall's Bluff?

A. Yes, sir.

Q. How many spur tracks did you have connected with the house track?

A. I believe there were four.

4815 Q. Were there any spur tracks connecting with the passing track there?

A. There was none then; there is now.

Q. A side-track and four spur tracks connecting with it?

A. Yes, sir, four or five.

Q. That complicated the switching proposition somewhat?

A. Made it very bad.

Q. How was it at Brinkley?

A. At Brinkley, the switching was all good—the tracks were nicely arranged.

Q. Have any spur tracks?

A. Yes, sir.

Q. Had a house track there?

A. Yes, sir.

Q. How many spur tracks did you have?

A. I don't believe I can tell; you see there was a White & Black River line that came in there, and the Cotton Belt,—I don't believe there was but about five spur tracks.

Q. How was it at Forrest City?

A. That was mostly all spur tracks there on the hillside.

Q. Was there a house track there?

A. Yes, sir, it was a spur too.

Q. Was there also a passing track?

A. It was not considered a passing track right there; it was a

house track connected at both ends, but the passing track was in the cut.

Q. How many spur tracks did you have connected with
4816 that side-track?

A. That side-track, I don't think there was but one spur.

Q. Side or passing?

A. I believe there were five besides the house track, that was connected at both ends; in the olden times, we hadn't passing tracks, before they had long trains.

Q. How was it at Madison?

A. There was lots of spur tracks there.

Q. You had a side-track in Madison also?

A. No, sir, it was all a big spur with other spurs running off to it.

Q. The spur track and then spurs running into that?

A. Yes, sir.

Q. How many spurs were there that ran into the main spur track there?

A. I think two was all, but there were two spurs—one goes to the box factory, and one to the saw-mill—one on one side of the main line and one on the other; one was a straight spur and the other had other spurs on it.

4817 Q. Do you remember how many there were?

A. I think two was all that came in there. I think that is it.

Q. Where there were a number of spur tracks running out from the House Track or Main Track—main spur, it complicates the switching by having to move them all?

A. Sometimes it does, at Forrest City it didn't—I don't remember whether one spur track lead off from the house track or not, at Lonoke it did not, but at Duvall's Bluff it did, because the main lead ran off from the depot and in working all the industrials below there, you had to move all the house cars—move them to some spur while you did your switching, and then pick them up and spot them back again.

Q. Now you say that part of that mine—the time you were laid out on that local train, you were laid out by other trains and by engine failures and by meeting other trains out on the road?

A. Yes, sir.

Q. Now what do you mean by meeting other trains out on the road?

A. Sometimes we would possibly change engines—someone would come along with a better train than we had and just take our engine and we would have to take the sorry engine.

Q. Speaking about engine failures, what are they?

A. They are usually for steam failures and sometimes a break down.

Q. Just the usual incidents?

4818 A. Yes, sir.

Q. Then by laying out of trains—you mean the meeting of trains?

A. Yes, sir.

Q. A good many more trains ran on the Iron Mountain road than there was on that line at that time?

A. I should think there would be, but I was not especially familiar——

Q. You have a general idea of the traffic of the Iron Mountain?

A. I imagine they ran more trains.

Q. A great many more trains considering the volume of other traffic, wouldn't you think so?

Mr. HILL: What part of the Iron Mountain are you referring to?

Mr. MOORE: I mean the Iron Mountain main line, the Fort Smith lines, and those old lines that have been used a long time?

A. I should think they would be running more trains on the main line, but I would think we do more business than they would on the Fort Smith or Valley Divisions.

Q. How about the Knoble Branch?

A. I am not acquainted with the Knoble Branch or the Helena Branch, I don't think they had but a freight train each way.

Q. How was it on the Bald Knob Branch?

A. I think they had a pretty good business over there, but I don't think they done the business over there we did, that is as a
4819 whole. You see we crossed the Helena Branch at Forrest City and the Bald Knob Branch at Bridge Junction.

Q. Your estimate of the division of time which you made was just general estimate based upon your recollection I suppose?

A. Yes, sir.

Q. You would not undertake to be definite about it would you?

A. It is just according to which way you would mean definite, I thought over it after I got out of here the other day, got to figuring and trying to figure out the trains and the other things, and I was pretty well satisfied.

Q. I refer to the 11 hours that you divided between switching and meeting other trains on the road and engine failures?

A. Yes, sir.

Q. I suppose that is like these other matters—your memory is not very good about them?

A. There is little details that you cannot remember so well, but there are certain general things that you can remember tolerably well.

Q. The conditions and character of the labor to be done in switching is continually varying from day to day, depending on the traffic isn't it?

A. State that again.

Q. The switching you have to do at different stations varies?

4820 A. Yes, sir.

Q. And it wouldn't be the same on different lines of road?

A. No, sir, I should think every station would be different.

Q. Whose orders does the conductor of a freight train act under in switching?

A. He acts under the agent's orders at the station.

Q. The agent transmits the orders to him?

A. Yes, sir, he gives him the switch list.
Q. Who do they come from?
A. Usually from the despatcher.
Q. Who does the despatcher work under?
A. You are getting in too deep water for me.
Q. The superintendent of the division is the general head of that sort of operation?
A. Yes, sir.
Q. And it really originates and eminates from him—the orders in regard to switching?
A. Yes, sir—wait just a minute about those orders eminating from him, you understand he is over everything on that division, but there is certain shipments laid out he wouldn't know where you were, where you were switching or on what track you were, the despatcher looks after that, he keeps after cars so that he knows these things, the conductor renders him a report from blind sidings.
Q. In describing some of the services that you rendered in switching, you spoke of setting the cars out—four or five cars at cer-
4821 tain places, you also picked up cars didn't you?
A. Not on that run, rarely ever, the only cars we picked up that run, the only thing I ever remember picking up, and I don't believe I picked up that, was picking up a car of stock that went west—I know that has been done.
Q. Wouldn't there be cars to take out?
A. No, sir, I was speaking about our No. 9, 31 or 83.
Q. What was the particular run you were testifying about?
A. This is one train, our No. 9, 31 or 83, those were our High Ball trains, and we set these cars out but we didn't pick any up.
Q. Who picked them up?
A. That was their destination.
Q. These cars would be picked up and taken away from there some time?
A. Yes, sir, the empties would be picked up and taken away.
Q. Who picked these empties up?
A. Sometimes they would be picked up by the local and sometimes set on the siding and loaded.
Q. The locals had to get them out of there?
A. Sometimes—last night I was down to the depot and there came an engine and caboose by there going out, and they will pick up loads all the way from here,—that is a through train, that is an extra, it is not a local.
4822 Q. The other trains picks them up at Terminal Stations but doesn't at local stations?
A. Yes, sir.
Q. Then it isn't a through train if it is doing that kind of service?
A. It is not on the time card as a local.
Q. Isn't it one of the distinctions, and so far as its operation is concerned, a very important distinction between locals and through trains, that the through trains do not do that kind of work—pick-up work and the cars are taken away from it at the terminal station, and the local does the work at stations?

A. That is generally the way.
Q. It wasn't worked that way when you were running?
A. It was generally worked that way.
Q. You would leave a car to be unloaded and then it would have to be hauled out of there empty, or if there was another load put in there, they would have to be hauled out on your local?
A. Generally so they did, for instance, Brinkley is a pretty good point, and we have a branch off the White and Black River——
Q. You would call that a kind of a terminal? Terminal station?
A. If you want to consider it that way.
Q. That is not the kind of work that through trains do at way stations?
A. Not considered so.
4823 Q. Was the practice different on that road from what it generally is in that respect as between picking up by through trains at way stations?
A. I don't know about that, most every official has his own way.
Q. You couldn't tell by your experience on that road what the practice would be on another?
A. No, sir, not positively.
Q. Do you know about how it would compare with the Iron Mountain?
A. No, sir.

Redirect examination.

By Mr. HILL:

Q. In referring to orders about switching, would the train despatcher give the orders for switching at a station or would the station agent?
A. The orders that we usually had was just a switch list.
Q. That was given to you by the agent?
A. That would be handed to us by the agent.
Q. Do you know whether the train despatcher would direct the agent to make up this switch list?
A. I know if we refused to do the agent's switching then he would get orders from the Train Master for us to do it.
Q. You would get orders as to the switching from the
4824 station agent?
A. I believe our book of rules had something of that kind in it, it has been a good long time since I looked at it, I think there was a rule in the book of rules that we would apply to the agent for the switch list.
Q. That was the practice?
A. Yes, sir.
Q. He would tell you where to put in the cars and where to take them out?
A. Yes, sir.

Recross-examination.

By Mr. MOORE:

Q. And he would get his orders from the Train Master I suppose—or the train despatcher?

A. I should think that is where he would get his orders, the despatcher kept track of the cars.

Witness excused.

4825 D. L. MCNEW, being first duly sworn and examined testified as follows:

Direct examination.

By Mr. HILL:

Q. Mr. McNew, please state your name, age, residence and present occupation?

A. D. L. McNew, age 48, I live in Little Rock, and am in the Real Estate business.

Q. Have you ever had any experience in the Railroad service Mr. McNew?

A. Yes, sir.

Q. Wish you would give a little history of your railroad experience, beginning first—at the first of it, give the various capacities in which you have served, how long, and with what roads?

A. I began—I don't remember dates very well, I may make some mistakes of several months.

Q. I am not caring about that, I want you to give us approximately the history of your service.

A. I began in 1882 as messenger boy for the Monan at Mitchell, Ind. I worked at that station about a year in different capacities for about a year for two different railroads,—the Monan and the Ohio & Mississippi; I worked for several months in the Road Master's office as clerk; in 1883 and the beginning of '84, I worked for the Vandalia,—clerk at Greenville, Ill. During the summer of 1884 I worked for the Frisco Railroad out of St. Louis, and for the Southern Kansas Railroad in Kansas as brakeman, that was my
4826 first experience as a brakeman when I first started—I worked a while for each one of them. I came here in the fall of 1884 and went to work for the Little Rock & Fort Smith as brakeman. From that time until about March 1889, I worked on the Little Rock & Fort Smith and Iron Mountain railroads most of the time as brakeman. From March 1889, for three years and seven months, I was night Yard Master for the Old Memphis——

Q. That is the present Rock Island?

A. Yes, sir. I had charge of the switching at nights, and part of the time in the day time—probably a month of so at a time. I was then out of Railroad service probably about six months, when I went to work for the Iron Mountain as conductor.

Q. As Freight conductor?

A. Yes, sir, freight conductor on the Valley Division, I think I

worked for them two years down there; and from there I went to the Cotton Belt at Pine Bluff, worked four years as freight brakeman and conductor,—most of the work I did was between Pine Bluff and Texarkana and Shreveport.

I was then out of the service of the Company probably six months, and then I went to work for the Illinois Central at Central City, Ky., as Yard Master, and I held that position about ten months, then I transfer-ed to the Evansville District as freight conductor, and I worked there about four or five months.

4827 While working there I was appointed Night Yard Master for the Old Choctaw Company here at Little Rock, came here on the 10th of January, 1900, and I was in the service of the Company until March 1906 as Yard Master and conductor.

Q. Freight or passenger conductor?

A. Freight most of the time, passenger conductor part of the time.

Q. Did you ever run on local and through freights?

A. Yes, sir.

Q. You had experience with both of them?

A. Yes, sir.

Q. You quit the service I believe you say in March 1906?

A. Either the latter part of February or the first of March, about that time.

Q. You haven't been in railroad service since?

A. No, sir.

Q. We are trying this case, Mr. McNew, as for 1907, you were then out of the service at least then a year before our questions come up.

Did you have service as brakeman in the days when the link and pin were used and hand brakes?

A. Yes, sir, that is nearly all the braking that was done by me except on the Cotton Belt, we had a few air cars—well we had a good many patent couplers, they come a little earlier than the airs did,—I probably had four years with the link and pin couplers as brakeman.

4828 Q. You had observation and experience in the use of the automatic coupling and air brake in the yards and also on the road?

A. Yes, sir.

Q. Mr. McNew, in make- a division of expenses between local and through trains in this case, the State has filed exhibits in which they have made an allowance for damage to equipment from starting and stopping and from switching—they base their exhibits upon a table prepared by Wellington, an authority upon railroad matters, in which he puts these two cases of injury to equipment at 35 per cent of all the injury to equipment. Now I will not ask you to pass upon that percentage,—I understand in this case it is not disputed that was the correct percentage in the days of the link and pin and hand brakes, but several witnesses have testified, owing to the change of equipment from link and pin to automatic couplers, and from hand brakes to air brakes, that this percentage should be changed—that

it should be greater, assuming that 35 per cent was the per cent in the old days—that it should be greater, I wish you would give us the result of your opinion, based upon your experience as to that?

A. Of course I know nothing about the percentage——

Q. I say, assume that was the correct percentage, I want you to give the comparison of the damage to equipment in the days of the old equipment as compared with the damage to the equipment—the cars, under modern equipment—that is the point I want your
4829 opinion on. Assume that the percentage is correct, or any other percent—or just an average comparison of the injury to the cars under that system as compared with the injury to the cars at the present.

A. Well there is no question about where the equipment would be part of the old and part of the new mixed, there probably would be more damage, on account of the strength of the engines—the strength of part new equipment, there might be more damage than there would be under the old, but take all new equipment, I don't think the percentage would be raised any—The cars are not handled as carefully by the men as they used to be, because they don't deem it necessary, for they are so much stronger and can stand more rough usage, but my observation is, the percent of damage would really not be as great,—I don't think it would—as it would under the old equipment.

Q. Take starting and stopping, separate those two things—these have been considered together, starting and stopping on the road and in switching,—let us consider them separately. Take starting and stopping on the road about what damage would there be under the present equipment as compared with the damage under the hand brakes and link and pin?

4830 A. I don't think the present would be as great, from the fact the old equipment had a great deal more slack, and in starting trains forward on heavy trains especially, the old engines would start and invariably back the train up and then start, and that would take the slack out, and in going over the roads, going over the rough places, they would be pulling out drawheads, and I don't think they would have so much of that probably under the new equipment—they can't get any slack much with the new equipment, and I don't think the percent of damage would be near as great under the new equipment as it was on the old on that account.

Q. Now Mr. McNew, we have another problem here for switchmen and trainmen. The State in its exhibits has allowed fifty per cent for switching done by local freight on the road. That is considered on mileage basis—in other words, if there is a run of 100 miles, they have counted it 150 miles, allowing 50 miles for switching done by that train. Several of the witnesses for the railroads have testified that this is not sufficient allowance, and that it is not feasible or practicable to ascertain how much switching is done by a local on the road. Now I would like for you to give your experience on that as to whether you can make an approximately accurate esti-

mate of that, based upon experience and upon the general average conditions?

4831 A. Well, I would like to say that every run I ever run on would be different from every other one, I don't think I ever was on a local run that there would be fifty per cent additional mileage made in switching.

Q. How do you get at that, you have an idea it wouldn't be that much, I want your reasons, I want to know how you get at that proposition?

A. Well that is pretty hard for me to do, except just from my experience and knowing the distance we have to travel and set out our cars and doing the switching at different stations—like this, you might ask me how many men in this house, I know there is not fifty, but I don't know how many there is without counting them.

Q. Can you illustrate that by taking some run with which you are familiar, and consider the number of stops that are made and the amount of switching that is done and the speed that you make in switching?

A. Well, I might figure like Mr. Nash did, I never have done that, of course that would put a limit to the number of miles and the time consumed.

Q. You heard Mr. Nash's testimony and his estimates based upon his experience?

A. Yes, sir.

Q. How do they compare with your experience?

A. I believe Mr. Nash's speed is too high, I don't believe he can average five miles an hour—it wouldn't average five miles an hour.

Q. I believe he took five miles an hour speed actually

4832 made while engaged in switching?

A. Yes, sir.

Q. I don't know whether he stated the maximum or not.

A. You might take a state where you have no freight to unload and nothing to do but switching, and nine times out of ten you would switch an hour, and you wouldn't travel five miles in doing that much work, taking every thing into consideration, looking up the cars, coupling them up, and there is always more or less delays you can't explain, you couldn't explain it to the train master.

Q. The engine wouldn't run up and down the track all the time?

A. No, sir.

Q. Here is the point I want your opinion upon. Can you take various local runs on any other railroad, take men familiar with the business and the usual way business is run, can you,—taking all these features into consideration—arrive at any fairly accurate estimate of how much switching is done by a local freight?

A. You mean the amount of miles run by the engine?

Q. Yes, sir.

A. Yes, it would be figured out accurately, I could make a trip and tell you without keeping cases of every little move I would make.

Q. You think it is something that can be worked out accurately?

A. Yes, sir.

4833 Q. Did you hear the quotations I read from Mr. Gray's testimony and Mr. Ward's testimony?

A. No.

Q. I believe I have stated in my previous examination, that they didn't think that was a matter that could be worked out. These two excellent gentlemen who testified that fact were General Managers, if you were going to work out that problem, who would you go to—the General Manager, or, what men would you go to to get that information?

A. Taking that from a General Manager's standpoint, his answer is correct, but taking that from being on the ground and from experience, his answer is not correct.

Q. Who would know most about it the General Manager, or the brakemen or men running the train?

A. I don't think—I don't see how any body could know that except the people right on the ground.

Q. Mr. McNew, in an exhibit filed by the Railroads, No. 56, they have made certain calculations on the expense of the local and through freights and have counted the *the* local train stops eight times to one stop of the through freight—I am speaking of freight trains, I will ask you what is your opinion upon that?

A. Well, that is like the other question, it is different on different divisions, you take the division I run on, I run on the local between Hopefield and here, Hopefield is near Memphis.

4834 Q. On the Iron Mountain?

A. No on the Rock Island.—I don't know that I ever made every stop, it is a hard day that you make every stop, there are about forty stops on there for a local, and on the through freight—it makes, I would judge about eight—that would be about five to one, if the local would make every stop, they ever make and the through freight would make their ordinary stops that they always make, the local would stop about five times to the through freight's one.

Q. Now is that anything like the usual conditions that the local would make every stop?

A. No.

4835 Q. Out of the possible 40 stops, how many, under general average conditions, would you make?

A. Probably 30.

Q. How many did you say for the through?

A. 8 stops, I think; that is for water, crossings, and not taking into consideration any stops for passenger trains?

Q. That would be the maximum stops of the through?

A. Yes, sir, I think they would make eight, if there were no other trains on the road besides that.

Q. Speaking of the through, are you speaking of the fastest through or the general average of through trains?

A. I was speaking of what we call our Red Ball freight train.

Q. That makes the best time and fewer stops than any others?

A. Yes, sir, it is in a class to itself.

Q. You say the average local would stop 30 times out of a possible

40; take the average through, not considering the Red Ball, but all other; how many times would they stop on an average—I am trying to get a natural average condition.

A. They would probably stop half as many times as the local or there would be trips when they would not stop any more.

Q. What I am trying to get at is an average condition, year in and year out, season in and season out; have you had ex-
4836 perience on other runs besides that of the Rock Island to Memphis?

A. Yes, sir.

Q. Have you had experience on the Iron Mountain?

A. Yes, sir, but that has been several years ago; I never did much local work on the Iron Mountain; I was nearly always on through freights.

Q. Are these figures you have given, on the run from Hopefield to Little Rock, on the Rock Island, would they fairly represent the general conditions; of course, I understand that one division will differ from another; what I am trying to get at is the general condition, would that be fairly representative of general conditions in the State of Arkansas?

A. Yes, sir. I think there is probably part of this road between here and Memphis, on the Rock Island, where there is as much local work as anywhere.

Q. Taking it large and small, you think that would be fairly representative of general conditions?

A. Yes, sir.

Q. Speaking of that fast train, are you familiar with #55, Red Ball on the Iron Mountain?

A. No, sir.

Q. You know all the roads run one fast train at least.

A. Yes, I understand that nearly all the roads have that fast freight train; it is classed maybe one or two runs higher; it is classed higher than the other through freights.

4837 Q. Assuming for the purpose of the question, you say you haven't personal knowledge of it, that this fast train of the Iron Mountain,—St. Louis to Texas, on its main line, you would know from your general railroad experience how that would be handled, I presume?

A. Yes, sir, they would have the necessary stops to make at all railroad crossings, and water tanks.

Q. I wasn't going into that; I am just assuming that you know general conditions about the fast train on the road; I want to ask you this question:

Would that fast train receive the same terminal handlings, or rather the cars in it, receive the same terminal handlings at division points, that other through trains on the same road would receive; in other words, would the fast train be fairly representative of the amount of handling that would be accorded the through train in division terminals?

A. No, sir, I would think not.

Q. Explain the differences between the fast freight that is run,

between other through trains that run, so far as division handling is concerned?

A. Those fast trains, every preparation is made to save delay to them; where there is any pick-ups, they are always fixed, placed first out, or in a place where they can be picked up with the least delay, even in big yards. Very often a man's position depends on whether he does delay that train or not; while the other trains, ordinary dead freight, it don't seem to have any particular

4838 thing to do with the handling of those trains,—not so much at least,—probably it will be composed of lumber or cotton, or something that is picked up by locals or through freights on the road, brought into the terminals, and used to fill out the engine's tonnage with, on either those fast trains or some other through trains.

Q. And they would all be switched in the terminals?

A. Yes, sir, probably stored; some may stay around for several days.

Q. You have had experience as yardmaster and know how those are handled?

A. Yes, sir.

4839 D. L. McNew, being recalled for cross-examination, testified as follows:

By Mr. Moore:

Q. Your service as Night Yard Master on the Old Memphis & Little Rock was here at Little Rock?

A. Yes, sir.

Q. This was the terminus of that road wasn't it?

A. Yes, sir, of the Old Memphis & Little Rock,—my service with the Choctaw Company was when they first organized their forces—when they first commenced runinng through.

Q. This became a terminal station?

A. Yes, sir,—always has been I suppose for through trains. I would like to say in that connection though, that during my service as conductor, I have often been detailed to different yards, and I didn't keep any record of that, because it was just detail work for a conductor—I have been Yard Master at three or four different points on the Iron Mountain at small stations like Pine Bluff, Monroe, Alexandria and Wilmot, and also on the Rock Island at Hot Springs, I went over there two or three different times—especially during the rush business—during the races, I was over there two or three different times when I was running a local train on the White & Black River—I was sent over to Hot Springs and handled the yards during the races, and all that time I was classed as conductor, but simply on detail service.

4840 Q. You were asked whether you had service in the days When the link and pin and hand brakes were used, and you testified, "Yes, sir, that is nearly all the braking that was done by me except on the Cotton Belt, we had a few air cars." Now when

was that, what was the date of your service in which you state was the time when they had a few air cars?

A. I believe I went to work for the Cotton Belt in 1894—we had a great many—we had mixed couplings, I expect a majority of them were automatic at that time, but not many air cars.

Q. Most of your experience was with the hand brakes?

A. As a brakeman, yes, sir, but I was a pretty good brakeman when I was a conductor most of the time.

Q. Are you familiar with the automatic equipment?

A. You mean the coupler?

Q. Yes, sir.

A. Yes, I think so.

Q. What amount of space is there between the head of the draw-bar and the dead-wood in that coupler?

A. Well, I don't know what the standard is,—of course the coupler—the springs may become weaker——

Q. I just mean—I don't mean in exceptional matters—there is a spring in both that gives play in back of the draw bar?

A. Yes, sir.

Q. Now there is about the same play in connection with
4841 that spring in the two kinds of bars—that is what I want to call your attention to?

A. Well no, there is more play in the old bars.

Q. How much more do you think there would be—now we will consider they were all in good first class order?

A. There would probably be—I will say this, we will take two cars, put automatic coupler between them, all in first class order, and we will put the old couplers between them with the ordinary link and pin, and there will be a difference of from one to two feet—anyhow one foot—I will approximate it as one foot, the difference in the amount of slack in the old couplers, there would be that much more.

Q. Mr. McNew, what is the space when it is at tension between the ends of the two—old style draw bars?

A. I couldn't answer that.

Q. It is no more than 2½ inches between the ends of the draw bars—I am talking about between the drawheads.

A. The Draw heads?

Q. Yes, outside the pin,—you know the link is held in by the pin in the opening in the draw-bar, and the draw-bar still projects beyond that. Now I want to know how much space is there between the draw heads?

A. Oh, at times, there would be—owing to the length and of course the size of the pin hole, and all these things, and in the time we had these old draw heads, there was hardly ever any two of them alike—every road had its different patterns, one road
4842 would have five or six different patterns maybe, and there would be probably a space between the draw-heads of about two or three inches.

Q. Then the additional play was given by the back springs of the draw bars?

A. Yes, sir.

4843 MORD ROBERTS, being first duly sworn and examined, testified as follows:

Direct examination.

By Mr. HILL:

Q. I wish you would state your name, age, residence and present occupation?

A. Mord Roberts, 57 years of age, residence in Argenta, Pulaski County, Arkansas. I am in the sand business; I have a dredge in the Arkansas River, producing sand for commercial purposes.

Q. You have had long and varied railroad experience, I understand; I wish you would give, as briefly as you can, to develope the experience you have had, a little biography of your railroad experience, commencing at your first work, and with what railroads, and approximately the length of time you worked for the different railroads, and the capacity in which you worked?

A. I am a machinist by trade, learned my trade in the City of Philadelphia, in the Baltimore Locomotive Works, transferred to the Pennsylvania Railroad Co. 1873, as machinist, and after a year and a half's service as machinist, went on the road, firing a locomotive ten months; promoted to the position of locomotive engineer,
4844 ran a locomotive there until July 12, 1876. Dismissed for collision Centennial Yards in West Philadelphia; reached St. Louis July 16th, 1876, and took service with the St. Louis, Iron Mountain & Southern Ry. as machinist, July 17, 1876. Continuously in the employ of the St. Louis Iron Mountain & Southern Railway from that date until May, 1899, as machinist, locomotive fireman, locomotive engineer, travelling engineer, general foreman of shops, De Soto, Missouri, Master Mechanic at Little Rock; for last six months service, general master mechanic, Iron Mountain Railroad, with offices at De Soto, Missouri; two years as General Master Mechanic, Louisville & Nashville Railroad, headquarters Louisville, Kentucky; three years Superintendent of Machinery, Kansas City Southern Ry., part of the time with headquarters at Kansas City and the remainder of the time headquarters, Pittsburg, Kansas; leaving the railroad service entirely, August, 1904.

Q. That was your last railroad service?

A. Yes, sir.

Q. The state has made an effort in this case to divide the expense between State and interstate traffic, and in doing so, in dividing the expenses of freight traffic, they have started with the expense of the local and the through trains, in order to arrive at a proper division between state and interstate.

It is in evidence here that the local train stops ofterner than the through train. There is a conflict in the testimony on that
4845 point, but it is undisputed that it stops oftener.

The State's accountants have made up exhibits in which they have put that at four times to one. It is, I believe, an established fact, that stopping and starting of freight trains is a contributing cause and probably a large one to the injuries of freight

cars, and it is also in evidence that switching is a contributing cause and probably a large one to the injury of freight cars.

In order to take care of that item of expense that was heavier on the local train than the through, the State adopted percentages laid down by Wellington in his work on Railway Location of Expense, in which he gives a table of the distribution of the cost of freight car repairs to its various contributing causes.

He attributes to starting and stopping 21½% and to switching 13½%, making a total of 35% on these two items; these percentages were used by the State.

The railroad, in rebuttal testimony, introduced considerable testimony to the effect that while Wellington was a standard authority and recognized as such, that this table to which I have referred was prepared many years ago; it was based on experiments and tests made on the Pennsylvania Railroad, and was probably made in the early stages; at any rate, it was made while hand brakes
4846 and link and pin couplers and equipment were used.

Railroad witnesses have testified that owing to the difference in change of equipment from hand brakes to air brakes, from link and pin to automatic coupler, and various other improvements in mechanical devices and safety devices, that this table is now unreliable, and that instead of being the percentages given therein, that the percentages for these causes, stopping and starting and switching, should be much greater than they were under the old order of equipment.

I wish you would express your opinion, based upon your experience, as to the effect of the latter day equipment, to which I have referred, as contrasted with the link and pin equipment and the hand brakes, insofar as it affects injuries to freight cars?

A. Does that refer to the item of stopping and starting?

Q. I have included in my question both of them; probably you had better answer them separately, stopping and starting is one item, which Wellington gives at 21½, and switching, which he gives at 13½; they are grouped together in this exhibit as 35; I expect it would be better to treat them separately.

A. It was my experience, while connected with the railroad, that the application of the vertical plane coupler, with the improved draft gear, and also the completion and application of power brakes, to the train, had eliminated largely the damage accruing
4847 from stopping and starting in the train, local or through, and I believe I am familiar with Mr. Wellington's table, and as you stated, we all looked upon that as authority in its day, but that would not apply now to the changed conditions.

Draft gear and car underframing, has been designed and reenforced with a view to eliminating that damage; I remember very distinctly, when at almost any freight yard or at any intermediate terminal along the Iron Mountain Railroad, during the days of the link and pin coupler, that at nighttime, you would need a lamp to get through it and keep from falling over drawbars, and draft timbers, pulled out in the ordinary handling of trains.

The item of caboose chains or car chains in cabooses—we used

to have to re-enforce springs in our cabooses and to carry chains to chain up cars that would be damaged on the road by pulling out of draw bars; that was largely due to the braking of trains, all from the hind end of the train. They used to have a very severe brake in the caboose, and they would set that up, with the immense amount of slack that there was in the link and pin coupler, and if the train was of any length, it would very often pull out a draw-bar, and the contributary damages, as a result of that—of the drawbar dropping down on the ties—perhaps would not come out of
4848 the socket entirely—I have known of many very severe and expensive freight wrecks, as a result of that, which is almost, or was when I left the service, an unheard of thing, and we have knowledge of those things and I believe it is fair to presume that Mr. Wellington's figures today would be 50% too high for the item of expense due to stopping and starting of trains.

Q. Assuming that his table was correct, as near as such tables could be in the day it was written, of 21½ per cent to that cause, you would now ascribe what percent?

A. Not to exceed 12½, and I think 10 would be nearer the figure.

Q. What do you say on the other proposition—assuming that 13½% would be correct for switching, under the old order of things, what would be the difference now?

A. It is very evident that cars are handled very rough, as a result of switchmen not being compelled to go between the cars to couple them, which applies also to cars broken on the road, but as I stated in the other case, owing to the design of the draft timbers and rigging generally, which was all taken into consideration when the changes were made, the yard damage is not near so great as it used to be; that is due to the fact that the cars are built very much stronger—to take the cars that we used to operate, fifteen years ago, and handle them the way they handle them now, why you wouldn't need anybody only the switchmen, to break them up; they
4849 wouldn't stand it at all, but the expense to build those cars, to fit them for the purpose of resisting the rough usage, has been very much greater, but with a view, of course, to reducing the cost of maintenance.

Q. That additional expense would be reflected in the capital account, not in the repair account?

A. No, sir, that would not be taken into the repair account, and my judgment is that Mr. Wellington's figures are 25 to 40% too high, as applicable in these days.

Q. To be precise about it, our inquiry is as to the year 1907, as to the condition of affairs then?

A. 1907, the conditions had no doubt improved some in the way of more modern equipment, a larger percentage being in use than it was when I left the service.

Q. And I have used throughout in my questions, the present tense; I am really in error in doing that, because the exhibits in this case are made up on the repair accounts of 1907; I want to call your attention to that and ask you if your answers would be correct, applying your answers to the repair accounts of 1907?

A. My statements, I will state, are based on my experience, in the last years of my service.

Q. I presumed that, but I wanted to be accurate in the testimony; I should have stated that earlier.

Now, has your work been such as would particularly call
4850 your attention to these matters, of which you have just testified?

A. Yes, sir, I had charge and was responsible to the management for that work being properly done, and economically done.

Q. Necessarily you learned the contributing causes and their effect?

A. Yes, sir.

Q. You would not have held your job if you hadn't?

A. They discharged me then—the Iron Mountain did.

Q. There has been introduced in evidence, a table made up of contributing causes of damages, prepared by Mr. Berry, at one time chief engineer of the Union Pacific; now, I believe, chief engineer of the Rock Island. It was an address delivered before the Maintenance of Way Association, in which he based upon several years' investigation of the affairs of the Union Pacific, following the Wellington table, brought it down to that date, which was 1904, about the time you quit the service; I believe he reduced the stopping and starting somewhat and increased the switching a small percentage, making a total on these items of about 1% above what Wellington did; the point I want to direct your attention to, is this: If Berry's table were correct in 1904, which as I understand was somewhat of a transition period from the old equipment to the new, what would be the effect in 1907 of his percentages?

4851 Objected to by Mr. Moore because Mr. Roberts' service and opportunities of observation had ceased before 1907?

Mr. HILL:

Q. Since you left the railroad service, have you given attention to your old work?

A. No, sir, I have tried to forget it.

Q. You have not kept up with the changes?

A. No, sir.

Q. You do know, as I have presumed, that 1904 was rather a transition period in changing of equipment?

A. Yes, sir.

Q. I want to ask you this further question, in regard to Mr. Berry's table: How would stopping and starting and switching on the Union Pacific compare with those elements on the Iron Mountain?

A. I am not sufficiently familiar with the contour of the road or the nature of the business on the Union Pacific road to answer that question.

Q. You have been out on it?

A. I have been over it.

Q. Mr. Gray, one of the witnesses for the railroad testified in rebuttal, stated in substance this, as I recall his testimony, that if

it be conceded that the local stops four times, and the through train once, yet the element of damage for starting and stopping, multiplied by four, would not represent the real injury by that cause, because he stated there was a material difference in the dam-
4852 age to starting and stopping of local and through trains; to be accurate about that, I expect I had better read you Mr. Gray's testimony on that; page 712:

After this proposition was explained to him, he was asked to state if he thinks a sufficient allowance has been made there for starting and stopping of cars in local service, and this is his answer:

"There is as wide a variance as it is possible to conceive, between two similar things, between the stop of a local train and the stop of a through train in everyday practice.

"The stop of a through train is most frequently for transportation or operating reasons; that is, it is to stop to take a siding for or to meet and holding the main line for the opposing train. It is usually unaccompanied by any more work than taking of the sidetrack or holding the main line while the other train takes the sidetrack. The local freight train performs the greatest amount of functions in connection with a stop of that kind; it may be hours' duration or it may be short; it is all dependent upon the work required at that local station, as differentiated from a through train which has no work whatever to do.

4853 "I would say that an allowance of four times which is predicated solely upon the fact that the stops are four times as frequent, is wholly unfair. I am not prepared to say what it should be, but it should be several times that."

Q. I will ask you your opinion of those statements, based on your experience?

A. It occurs to me, if I might suggest there, that Mr. Gray has got two items mixed; it is the switching that he has reference to, that adds to the expense that the local would have.

Q. I am inclined to think you are right, but I don't know; I am just giving you in his own language, his entire statement on the subject.

A. The damage in stopping the train with the air brake, is to each individual vehicle in the train, which includes the wear on the wheels, brake shoes, and the brasses, and the local trains, as a rule, are light tonnage trains, and not near as many vehicles in the local trains as there is in the through train, and the damage to stopping a local train could not possibly be any greater than it would to a through train, and with the damage based upon each individual vehicle, if the local train had more cars than through trains, the damage would be greater, and if it had less cars, the damage would be less.

Q. For your information, I will state, that the statistics
4854 show that the average local train is 16 cars, and the average through train is 32, and on one road, 33. We are referring, of course, not to the expense per train, but the expense per car.

A. The expense per car should not be any greater.

Q. From this cause to any one train over the other?

A. The cost of stopping and starting, the greater expense would be to the train that had the greater number of vehicles in it,—the greater tonnage, simply because the strains and stress would be that much more severe on the cars nearest the engine; that is my way of looking at it, and that has been my experience; I don't think, in the damage to starting and stopping, we can consider the damage or cost of station switching.

Q. In the maintenance of way expense, the State has counted the locomotive as 2½ times the engine miles of the car, or to put it in another way, they have counted that a locomotive running 40 miles, there is as much injury to the way as a car running a hundred; that would be the practical effect of the division. In discussing that, Mr. Gray says at page 703:

"It takes into account no distinction between classes of lading, weights of lading, between the car where the tare is a large proportion of the loading on the rail and where it is a light proportion.

4855 It assumes that the cost is equally proportioned for a car handled five miles as it is for *for* a car handled three hundred or five hundred miles. The further inclusion of caboose mileage only accentuates this difference.

Above all that, however, is the fact that two and one-half times a car mile is not sufficient for a locomotive mile as it affects maintenance of way expense. The locomotive, with its shorter wheel base, with its greater axle load, with its connected drivers, with its constantly present problem of counter balancing, with its constantly chan-ing load, on the tank, due to the taking on and using up of coal and water, the known tendency of the engine tank to derail, out of proportion to all other carriages, the damage that a locomotive frequently does to the track itself, while it is on the track, and the greater proportion of damage it does if derailed, none of these facts are taken into consideration."

Those are his reasons for objecting to this allowance of forty miles of the locomotive as against one hundred miles of the freight car, including the caboose; I wish you would give us your opinion as to the reasoning of Mr. Gray there?

A. Owing to not ever having any experience in that line, I never took that matter up, never made any investigations in that direction; I don't believe I am competent to express an opinion.

Q. Do you know Mr. Gray's experience?

4856 A. Well, I am somewhat familiar with it; it is a question that even great minds might differ on; my judgment is, a properly constructed and designed locomotive, operated at a proper speed, is the easiest vehicle that goes over it.

Q. Give us your reason for that, that is what I want to get at, not percentages, but your reasons for contrasting these cars——

A. What I would say would be just merely from a mechanical and practical standpoint, not having made any investigation in that direction, never gave it any thought, but I have operated a locomotive and always considered the locomotive the safest vehicle in the train on any track, and I have run a locomotive over the Iron Mountain Railroad, parts of it and you could look back over the

train and actually you would be frightened; them cars looked like sheep going over a fence; the locomotive would be going along pretty fair.

A locomotive is derailed, excepting the tender less than any vehicle in the train, and owing to a locomotive being counterbalanced, the weight equalized so that it can transfer from one wheel to the other, to take care of the irregularity of the track, which is not the case with a freight car,—we take a one hundred thousand capacity freight car, load it with one hundred and ten thousand pounds of lading, weighing about one hundred and forty thousand pounds of itself, only eight pounds contact on the rail, distributed from center to center—perhaps about 25 feet,

4857 and the very fact of being familiar with the construction of different vehicles, my judgment is, a proper designed locomotive, operated at a proper speed, will not damage the track or right-of-way to the extent that a heavy loaded freight car will.

Q. Take it on a system of general averages, which we have to get at or should get at in this investigation, not taking the best locomotive or worst car, but taking the general average conditions of locomotive and car, I wish you would express your opinion, based upon your experience in the line of work you have done, as to the comparative injury to the way?

A. I don't believe that I am competent to do so.

Q. You just prefer expressing your opinion generally as to the situation?

A. Yes, sir.

Q. Now, there is another point testified to by Mr. Gray and several other witnesses here, as to the comparative cost of repairs, per engine mile, of a local and through engine; that is, an engine pulling a local and through train; I wish you would make a comparison between those two, based upon your experience in repairing locomotives; I am still referring to freight.

Mr. MOORE: I object to that on the ground that it is not proper rebuttal.

4858 A. My experience is that nearly all local freight trains are handled by locomotives that owing to defects or their weight, they are unfit for service in through freight and they are put—even after the flues get leaking, and anything that would cause detention to through freight, the engine is put in local freight service—was in my time, and for the reason that the tonnage was not heavy and the engine could be operated there very satisfactorily.

The expense for keeping the engine in service should be no greater than to keep a through freight engine in service.

Q. These calculations are made on the engine mile basis?

A. Yes, sir, well that engine mile basis, where the engine is not given any credit for the mileage made, and switching at stations, the ordinary care that the engine would receive at the roundhouse, would perhaps increase her cost per mile, actual miles run.

Q. The engine house service comes under another division.

A. This is shop repairs and maintenance that you have reference to.

Q. Yes, sir, and the road service under that head.

A. The engine has practically been 75% worn out in through freight service, as a general rule, and it is put in local freight service to be utilized there before going into the shop, to get all out of the engine that could be gotten out of it.

4859 Now, when the engine goes in the shop, if the expense of the repairs made to that engine is not distributed over the total mileage she has made since in the shop before, but charged direct to the last service she was in, yes, it would look as though she cost an enormous amount, but the actual figures would not show necessarily that the engines cost any more per mile for repairs than an engine in through freight service; I cannot conceive of any reason for it.

Q. Right on the same line, there is testimony here about the expense of maintenance of yard locomotives, as compared with a locomotive on the road; what is your opinion about that?

A. The yard engine, their repairs, owning to the low mileage allowed per car, which used to be with us only six miles per hour,—repairs show very high per mile, or show very high per mile.

Q. Could you estimate how much more they would be than a locomotive on the road?

A. They would be perhaps three times as much as locomotives on the road, on a mileage basis, simply because an engine working 12 hours, would only get 72 miles.

Q. That six miles, I believe, is the usual allowance that is made in the accounts, is it not?

A. Yes, sir; different roads have different methods; some allow six, that I have been on, and some allow as high as eight and a half.

4860 Q. Regardless of the allowance of six miles, taking the actual mileage, what would you say of the comparative injuries to them, or cost of maintenance of them?

A. The cost of maintenance, I would think, would be at least two and a half per cent greater.

Q. On the actual mileage?

A. I don't mean two and a half per cent, I mean two and a half times.

Q. Taking the arbitraries, you would put it at 3 times?

A. Yes, sir.

Q. There would be a difference of course, in the different types of locomotives that are in the yards, as compared with the road; what is the general class of the yard locomotives?

A. It is the general practice, that there is an engine specially designed for that service.

Q. In this case, Mr. Doddridge caused a test to be made on the Cotton Belt Railroad, for the month of October, 1908, of all the expense in the freight traffic—the fuel consumed by the locomotive in the through and in the local service was carefully obtained

from actual figures showing the consumption of each; the result showed that the fuel consumed by the through locomotives was 3½% more than that of the local, on the locomotive mileage basis.

The accountants for the State in this case, used those same percentages on the Iron Mountain. Mr. Gray, in rebuttal testi-
4861 mony, criticises that; he said at page 717:

"It is the application of a six months' operation on the Iron Mountain, with its varying conditions, branches and main lines, with a test on another railroad, without any comparison being given for the benefit of the witnesses, as to the engines used on the Cotton Belt as distinguished from the engines used in the several classes of service on the Iron Mountain, and no information as to the relative number of cars handled on the two railroads, the length of the local, and such as the amount of work done by the two, and my conclusion is that it is not a fair basis upon which to divide the expense of the Iron Mountain road."

Now, it is also in evidence here, from the exhibits in the case, that the trains, local and through, on the Cotton Belt, are practically the same number of cars as on the Iron Mountain, during our test period.

From your general knowledge of this question of fuel consumed on the Iron Mountain and Cotton Belt system, I would ask you what is your opinion as to the fairness of using percentages obtained on one road, and applying them on the other?

A. If the tonnage handled or cars handled, were the same, I consider the conditions and contour of the country very similar; I would be willing to accept the test made on the Cotton Belt as a fair
4862 representation of what could be done on the Iron Mountain or vice versa.

Q. In regard to the engine house service, the State has assumed that the local freight locomotive gets no more round house service per trip to the round house, than the through freight engine, and that assumption has been criticised in rebuttal. I wish you would express your opinion on that.

A. Do I understand the question right—the local engine receives greater attention and more repairs at the round house than through freight?

Q. The State assumed that the local freight engine gets no more round house service per trip to the round house, than the through freight engine,—cleaning, knocking fires, etc.,—whatever round house service would embrace, and that position has been criticised; I want to know your views on the subject?

A. Unless conditions have been changed very materially, since I was in the service, the poor local does not receive the same attention as the through does.

Q. In your opinion, there would be no more service rendered to the through traffic?

A. No, sir, on the other hand, the through traffic would be getting the best of it; the cost of caring for the local engine is no more than the through freight, but less.

Q. Turning to the question of passenger equipment, the problem

in this case is to separate the mail and express service from
4863 this passenger service, mail and express being carried on passenger trains, the state having no jurisdiction over that matter, and that not being one of the elements of controversy in this case.

It has been deemed necessary to apportion the expenses incurred by the mail and express service and then divide the passenger expense between state and interstate traffic, and in doing so, the car mile basis has been used, which, of course, would put the expense of the mail and express carried, on an equality with the expense of coach and baggage car per mile run; that is, set the coach and baggage car on the one side, and the mail and the express on the other side.

Now, that division has been much criticised as being unfair. I wish you would give us—I would like for you to give it fully—your opinion on the comparative cost of maintaining these various kinds of cars, mail, express and baggage and coach, per mile run, leaving out the Pullman, as that is taken care of;—it is in another account—by the Pullman Company.

A. The cost of maintaining a vehicle in a passenger train varies considerably owing to the size or dimensions of the vehicle; that is, if it was a passenger coach or baggage car or express car; the express cars, baggage cars and mail cars are usually closest to the engine;
the greatest amount of damage and expense to maintaining
4864 the draft gear, underframing and trucks, is usually applicable to the cars that are handled closest the engine, for reasons that is obvious, I guess to you; in the first place, those cars have to take all the shock and stress, due to starting of trains, and the damage to roofs and exterior finish, as a result of cinders and gasses from the locomotives; but other than those damages, the coach has a damage that does not enter into the baggage car or express car, and that is the damage to interior finish, lamps, and sash locks, and upholstering damaged sometimes by passengers, and as I said before, they pro rate this cost between the cars; it doesn't take as much labor or varnish to cover a 50 ft. car as it does a 70 foot car, and where the dimensions were practically the same, I would not make much difference between the kind of vehicles in the train, for I believe the damage to the cars nearest to the engine, as a result of the items I have just mentioned, is compensated for by the interior damage done to the passenger coach by the travelling public.

Q. Taking it by large and by small, you think one would about equalize the other

A. I believe they about equalize each other.

Q. There has been a question raised in here, as to the cleaning of coaches; it is a rather negligible quantity, but still it is a quantity
and should be considered: I wish you would explain the sys-
4865 tem of coach cleaning and train cleaning and by whom that delectable service is performed, and how it is managed?

A. To divide the differences in cost of cleaning the different kinds of vehicles?

Q. Not so much a question of division; I want you to explain the system, and what these men do, and how it is generally handled on the Iron Mountain road?

A. In my time, it was generally handled on the Iron Mountain Railroad at our terminals, where we had an organization like our union station here. There is a certain number of men carried as oilers and cleaners, and then some men as laborers that handle the ice, and those men's duties were many; they were to do anything that was necessary to be done in that passenger yard.

Q. Just enumerate, if you can think of them, their various duties?

A. Well, they sometimes take out defective wheels and apply replacement wheels and brasses, wipe the trucks, re-ice the trains, and give them water, clean the lamps, fill them, and sweep out the coaches, dust them, and oh, numerous things.

Q. I presume that there would be no doubt that they spend more time cleaning a passenger coach than they would a mail or express car?

A. Yes, sir.

Q. But could you tell by these various duties that this force would be employed in, how much it would really cost the
4866 company to clean a coach?

A. No, sir.

Q. Were any time slips ever made in which they would say, so much on cleaning, so much on icing, putting on new wheels, oiling and various things?

A. No, sir, that was just bunched and distributed through the number of cars that were handled through the station during the month.

Q. Now, I used to have a friend out on the Greenwood Branch, that had various duties to perform, among others a very perfunctory sweeping out of the coaches, how is a thing like that handled in a place like Greenwood?

A. During my time with the Iron Mountain, we had several points similar to that, and in the summer time, we had an engine watchman there who swept the coaches out, and did whatever was necessary to do to the coaches; we used to run into Van Buren in daylight, and there it was inspected by the regular car inspection force, and brake shoes were applied, if required, and we never kept any car force there excepting in the winter time; in freezing weather, we would give our engine watchman help to keep the fires going in the coaches and keep the coaches warm.

Q. About how much would you pay that friend of mine up there for his multifarious duties?

A. When I left here, we were paying him $45. a month; he was a good man.

Q. Yes he was; how would you divide that up on the
4867 time—the $45. a month, the time he spent in cleaning that coach?

A. I am free to confess I don't know; he was carried as engine watchman.

Q. Didn't you have clerks that were carried as car cleaners or to perform various numerous duties, among others, cleaning cars?

A. Yes, sir.

Q. I have used this Greenwood matter as an actual illustration,

but was that unusual in such a station as I have called your attention to there?

A. No, sir, not under the conditions that existed on the Iron Mountain at that time, it was not; we had several branch trains handled the same way; we had our trains at Wynne, Ark., used to be handled the same way, and up here at Bald Knob,—the Memphis trains at that time, some of them didn't run through to Little Rock; they cut out at Bald Knob; the same was true at Knobel, and the division between the car department and locomotive department was made in the office by the chief clerk and I don't recall how it was done.

Q. These car cleaners are like a pooh bah.

A. When you have nothing else, you can charge the expense to that, or employ a man to work in the office, you just hire a fellow and call him a car inspector or car cleaner and put him in the office to help out.

4868 Q. I would like to know what these fellows do that go in *in* the trains and sweep over us every time we go in there; they come in and sweep the dust over the passengers—is that part of the car force?

A. That is part of the car department there.

Q. Do they do anything else?

A. I think they find something for them to do around the freight yard there.

Q. I have been anxious to dispense with those fellows if they have no other duties; that is just one of their numerous duties?

A. Yes, sir, to sweep the papers and snuff cans and one thing and another out of the second class coaches.

4869 Mr. ROBERTS, being recalled for cross-examination, testified as follows:

By Mr. MOORE:

Q. I believe you stated that you quit the railroad service in 1904?

A. Yes, sir.

Q. I think you state also that you had give- no attention to railroad matters since that time?

A. No, sir.

Q. Your testimony then is based on conditions as they existed in 1904?

A. Yes, sir.

Q. Now, the link and pin coupler, consisted of—just state what the coupler was when in use, when you went into the railroad service?

A. In freight service, they universally used an open mouth coupler, admitting the link, made of about 1¼ iron, the mouthing permitting the entrance of the link, about 4¾ or 5 inches wide, and we used a pin an inch and a quarter by an inch and a half—was about the section; an inch thick and a- inch and a half the other way.

Q. And that pin dropped in it?

A. Dropped through the coupler; there was a pin hole in the coupler.

4870 Q. A pin hole above and pin hole below?

A. Yes, sir, it was continuous.

Q. What was the length of the link?

A. Usually about from 10½ to 13 inches—different lengths by different roads.

Q. What was the space between the ends of the draw bar and the cars when at tension, straightened out?

A. Between the draw bars when the tension was on them?

Q. Yes?

A. Probably from two and a half to four inches, depending upon the length of the link.

Q. The links then were not of uniform length?

A. No, sir, neither was the distance from pin hole to face of the coupler; that distance was not uniform either.

Q. What do you mean by face of the coupler?

A. Where the two come together.

Q. The two ends of the draw bar came together?

A. Yes, sir, where the ends of the two draw bars went on each car.

Q. From the pin hole to end of the draw bar?

A. Yes, sir.

Q. How much play did the draw bar have? Wasn't there a horn or some shoulder of some sort on the draw bar that would strike against the dead wood?

A. In some cases, but not universally used.

Q. Did they go in universal service?

A. No, sir, they never were.

4871 Q. What is the dead wood?

A. Dead wood or dead block, is a timber across between the draft timbers, just over the draw bar.

Q. What is the purpose of it?

A. The purpose is to be used in connection with the coupler as a dead stop and the horn or off-set——

Q. There was the horn that would go back and strike that dead wood?

A. Yes, sir.

Q. The entire coupling apparatus consisted of two draw bars, one in the end of each car, and when the cars approached, there would be a draw bar in the end of each approaching car?

A. Yes, sir.

Q. Describe that draw bar will you?

A. Which type do you want me to describe?

A. I mean that used in connection with the link and pin?

A. There was as many of those as there is letters in the alphabet.

Q. Take the ones in use then, take the ones in use on the Iron Mountain Railroad, during the time of your service there?

A. The link and pin coupler——

Q. I call it the draw bar.

A. Do you want me to describe it?

Q. Yes.

A. Well, it was made of cast iron, over all approximately 32 inches from the face to the rear end of the shank, looking
4872 at the end of the shank, at a round hole in it about an inch and a half in diameter. and at a later date, the pattern was changed so it had a key through the shank.

Q. Is the shank that end of the draw bar that is under the car?

A. Yes, sir, and connects with the draft rigging.

Q. Go ahead.

A. The hole in the center, a key way was to make it applicable with different types of draft rigging; we had in freight car equipment, about as many different types of draft rigging as there was types of couplers or draw bars; used very extensively on the Iron Mountain was what was known as the American Continuous Rod; those were rods—that is what this key way was in the shank of the coupler for; that key way was made to take a key about 7/8ths of an inch by 4½, just put in flat, and on the American continuous rod was a loop that slapped over the key, and that connected the two couplers together, supposed to take the shock of the car.

Q. Let me see if I understand—what is the length of the draw bar, of the solid casting?

A. They run from about 28 to 32 inches.

Q. At the rear end of that, speaking with reference to the front end of the car, and I mean the end that was under the car, was there a spring that it connected with?

4873 A. There was, as I have explained, there is many types of draft rigging that the bar connected to.

Q. Was there usually a spring there?

A. Yes, sir, in all cases.

Q. Was it attached to that spring or was there a plate separated it from the spring?

A. In one type, there was a follower going on the rear end of the draw bar, what we call a follower.

Q. What is that?

A. It was a plate, a given distance from the end of the draw bar, for the spring to go in there.

Q. Then there was a spring ?

A. Yes.

Q. That spring was what gave the draw bar play back and forth?

A. No.

Q. Wouldn't the draw bar, when it was driven in under the car, strike the plate between it and the spring and compress the spring, and in that way, make the play?

A. The spring was there to take the shock from the car.

Q. What was the working of the spring; what was the purpose of that spring?

A. The purpose of that spring was to take the shock and stress from the car proper.

Q. In what way did that spring operate in that manner?

A. Simply because the spring was between the draw bar
4874 proper and the draft attachment.

Q. The word spring implies there was a give in there, which would play back and forth?

A. Yes, sir, it was a cushion.

Q. The effect of that was to give play back and forth?

A. No, sir, the effect of that was to take the rigid shock——

Q. When the draw bar came back, if the draw bar had been against a stationary object, that was solid and immovable, there would have been no cushion and no play there?

A. No, sir.

Q. When it struck that spring, that spring gave way and the draw bar went back farther in the car than it would if the spring had not been there?

A. It went back farther than if the spring had not been there, unless the draw bar had butted up against part of the framing there.

Q. So, unless the draw bar butted up against deadwood or the frame that it works in connection with, there would be a play there, caused by the compression of that spring, when it would strike the spring, the spring would give?

A. There would be a compression of the spring, yes, sir.

Q. That would give play to the draw bar, and have the effect of absorbing the shock?

A. Yes, sir.

Q. Was there a yoke of some sort attached to the rear end of the draw bar, inside of which that spring worked?

4875 A. Certain types, yes, sir.

Q. Was there a plate at the front and rear end of the spring, what you called a follower a moment ago?

A. Yes, sir.

Q. The spring and the follower or plate, at each end of it, worked inside of the yoke?

A. Yes, sir.

Q. That yoke was bolted on the insides of the draw bar, at the back end of the draw bar?

A. Yes, sir.

Q. And when the draw bar was shoved with sufficient force back under the car, it would go against the plate and the plate would go against the spring, and the spring would give, and in that way, it would break the shock, absorb the shock?

A. Yes, sir.

Q. How was the draw bar,—in what way was the draw bar attached to the car?

A. By draft timbers.

Q. Explain those draft timbers; what were the draft timbers?

A. Well, with the link and pin couplers, all we had——

Q. First, what were they attached to?

A. They were attached to what we called the center sills.

Q. Now, if I understand you, the center sills mean this; there are sills that run longitudinally the length of the car?

4876 A. Yes, sir.
Q. And the center sills are the inner sills?
A. Yes, sir.
Q. How far are they apart?
A. In different construction, they differ, from 12 to probably 18 inches.
Q. And these draft sills to which the draw heads were attached, were strapped onto them?
A. Yes.
Q. Did they rest under them or along side of them?
A. Along side of them; sometimes under them, depending on the construction of the car?
Q. It was usual to place them underneath?
A. Usual to put them between them.
Q. They were bolted to what you call the center sill?
A. Yes, sir.
Q. That is the way in which the draw sill——
A. The draw timber.
Q. Were attached to the car?
A. Yes, sir.
Q. How was the drawhead attached to the draw sill, you had to attach it to the draw sill in order to fasten it to the car?
A. Yes, sir, the draw head was attached to the draft timbers.
Q. In what way?
A. By carriers and bolts.
4877 Q. I wish you would use plain words that people who are not familiar with mechanics will understand; I don't know what you mean by carriers.
A. A carrier would be the plate underneath the draw bar, bolted across between the two draft timbers and separating——
Q. Let me see if I understand that; the draw timber is bolted to the center sill?
A. Yes, sir.
Q. The draw head is bolted to that?
A. Yes, sir.
Q. Now, those draft sills are on the sides of the draw head, are they not?
A. Yes, sir, they are on the sides.
Q. So the draw head is bolted through the side of the draft timber, isn't it?
A. Where a yoke coupler is used, where the American Continuous draft rigging is used, it is a different attachment.
Q. What is that?
A. Which one do you want me to explain?
A. I refer to the American.
A. The American Continuous?
A. Yes.
A. The American continuous draft timbers, this key that I had reference to——
Q. Wait a moment; what is that key you spoke of?

A. The key going through the shank of a coupler passes
4878 also through the timbers.

Q. Do you mean a bolt when you say key?

A. No, sir, I just mean a flat piece of iron, about 7/8ths of an inch thick, and 4½ inches wide, by about 24 inches long; that passed latterally through the draw bar, and passing through these draft sills——

Q. Do you mean it passes at the side of the draw bar?

A. Right through the center, centrally through the bar, taking the bar longitudinally.

Q. Do you mean now that the key was inserted in the bar, or was it ar attachment at the side of the bar—I don't understand what you mean?

A. It was an attachment that went through the bar.

Q. Was there an opening through the center part that that attachment worked in?

A. Yes, sir.

Q. How was that key fastened to the draw bar?

A. It wasn't fastened to the draw bar.

Q. How would it retain its connection with it, if it wasn't fastened?

A. Simply because the key passes through the draft timbers and carried with it the bar at its proper heighth, and these keys were tied together at each end of the car, by continuous rods.

Q. What did those rods pass through?

A. They didn't pass through anything; they just tied the two couplers together.

4879 Q. I understand you then, that the one you are describing now, the American, the draw head at each end of the car, at each end of the same car, are connected by this rod you spoke of?

A. By the two rods.

Q. Are those rods connected with the solid casting of the draw bar, or with the yoke in which the spring works, in other words, I want to know if it is yoked in any way with the spring of which you spoke awhile ago?

A. No, sir, those rods are just connected to the key that passes through the shank of the draw bar.

Q. Those rods connect the two drawheads of a car and run longitudinally from one end of the car to the other.

A. Yes, sir, that is from one draw bar to the other.

Q. How are they fastened to the car, those rods you speak of?

A. They are not fastened to the car.

Q. They are under the car?

A. Yes, sir, they are carried by being attached to these keys, pass through what we call needle beams.

Q. Will you explain how this spring or cushion works in connection with those rods you speak of, in that type—how this cushion or spring works in the type of drawhead you have been describing?

A. I just don't catch the question.

Q. You stated awhile ago, that connected with the draw-
4880 head, and back of them, as I understand, was a cushion, that would absorb the shock?

A. Yes, sir.

Q. Now, in what way, did they operate in connection with the type of drawhead you have been describing?

A. The yoke running at the rear end of the draw bar, the end that is under the car, had two springs, coil springs with a follower in the center—that is, between the two—that follower——

Q. You mean by that, a plate?

A. Yes, sir. That check went down between two check plates that was bolted to the draft rigging, and there was a recess in those cheek plates that the follower slipped down in, and when the spring transmitted the shock to these cheek plates and the cheek plates to the draft timbers, and from the draft timbers to the center of the car——

Q. What was the purpose of those rods connecting the two draw heads?

A. I never believed that they served the purpose that the inventor of them believed that they would. It was his intention and it was expected by a great many mechanical men in the early days, that the type of draft rigging—that there would be a continuous tension from the forward end of the train to the rear end, without any strain on the structure; that is, the structure of the car, like as though it was one chain from one end to the other, but
4881 it didn't work out that way.

Q. Those rods, as I understand you, connected the drawheads at each end of the car?

A. Yes, sir.

Q. What effect did they have in the stability of the drawhead, preventing it from pulling out?

A. If you broke a key in one end, your other end was just as bad off.

Q. But before you could pull a draw head out of that type, the rods and key would have to break?

A. Or a rod break.

Q. Or the rod you speak of?

A. Yes, sir, and it would leave the entire pull on the small bolts that bolted the cheek plate to the draft timber.

Q. In other words, as long as the rods remained intact, in order to pull the drawhead out, at one end, you would have to disturb it at the other end of the car?

A. Yes, sir.

Q. There is another type of drawhead, wasn't there, which was attached to a draw sill that was at the side, and that was bolted there,—a wooden draw sill at the side of it?

A. Yes, sir.

Q. Is there any name for that?

A. Well, there was several types of those; I don't know just which one you have reference to.

Q. Take the one that was in use on the Iron Mountain
4882 road and describe that?

A. There was several in use at that time.

Q. Describe one that would represent them in a general way?

A. The Butler draft rigging, and the Minor draft rigging, they were all used in connection with the link and pin coupler.

Q. They were attached to a draft sill, which was strapped or bolted underneath the center sill on either side of the draw bar?

A. Yes, sir.

Q. And the draw bar was bolted, fastened by a bolt, attached by a bolt to that draft sill?

A. Running down through the center sills, and the draft sills, where they were bolted underneath the center sills.

Q. Now, there was on the inner side of the draft sill, a casting between that and the drawheads?

A. In some cases.

Q. And the draw head was bolted on that through the wood and the casting?

A. Yes, sir.

Q. Then the drawhead itself would work back against this plate or follower and then the plate would come in contact with this spring you speak of, and at the opposite end there was also a plate or follower?

A. Yes, sir.

Q. And the yoke which includes the spring, was bolted
4883 onto the casting or solid part of the draw bar?

A. Yes, sir, the shank of the draw bar.

Q. All those types, you say were used on the Iron Mountain while you were there?

A. Yes, sir.

Q. When did the automatic coupler or what you call the vertical plane coupler come into use, when did it began to come into use?

A. There was types of them introduced as far back as about—as near as I can recall, about 1888, but they were not perfected, so that they were interchangeable, and could not be applied indiscriminately on all roads until about 1894 or 1895—I am not positive about those dates for the reason that the automatic or vertical plane coupler could not be used on all heights of cars; that is, where the center height*h* of the draw bar was not the same from the rail or practically the same,—like you could with the link and pin.

Q. That would prevent it being used interchangeably.

A. Yes, sir, and they would become uncoupled in movement; I might ask Mr. Rosing to refresh my memory—what year did the Master Mechanics and Master Car Builders Association adopt a maximum and minimum heighth for center draw bars,—and explaining that, it was necessary to do that before the Interstate Commerce Commission could enforce the application of them with safety.

Q. I see the point you make; not being the same height
4884 they could not be worked together?

A. They would slip by each other.

Mr. Hill: My recollection of that act provided that this Safety Appliance Act provided that these appliances should be put in according to the regulations of this Car Builders Association.

Mr. ROSING: There was always a standard height*h* of draw bar for link and pin coupler, back as far as I can recall,—33½ inches was the old standard for freight cars, for the last 45 years, and then when the Master Car Builders' coupler came into use, which was to interchange with all classes of equipment, of all railroads of the United States and Canada,—that came into effect in 1893, giving a certain length of time to make the change; the standard height*h* was laid at 34½ minimum empty and 31½ maximum loaded; there was a variation then and there is a variation allowed today; I think that was about the time the Safety Appliance Act was passed or the application of automatic couplers was made.

Mr. ROBERTS: I think perhaps it was adopted at the convention at Saratoga.

Mr. MOORE:

Q. What was the object of requiring that uniformity of height*h*?

4885 A. The object of requiring uniformity of heighth was to obviate the difficulty of cars becoming uncoupled in transit, through the irregularity of the track, one car raising up a little and one going down, they would slip.

Q. After this regulation had been complied with, did it become so you could use the two interchangeably, the vertical and the link and pin?

A. No, sir, they were never interchangeable.

Q. Go ahead now.

A. I have got away off.

Q. I will bring your attention to it then; the question I asked you was when they came into use, and that is what you are attempting to describe?

A. They didn't come into general use—they were not perfected unttil about 1891 or 2.

Q. You spoke in your statement awhile ago, about their being used interchangeably, what do you mean by that?

A. If I did, it must have been in error; they could not be used interchangeably with link and pin couplers.

Q. I understood the link and pin coupler—what do you mean by that reference—that was your language?

A. I don't know.

Q. I suppose what you meant was that the draw heads were used interchangeably with the old draw heads; that is, you would take one of the automatics, a draw head with an automatic on it

4886 and substitute that for a link and pin draw head, but you would have to do that on both cars?

A. When the first vertical plane coupler was made, so it could be used in connection with link and pin couplers, it had a link slot in it, and with the pin hole.

Q. What was the purpose of that?

A. That was so they could use them in connection with the link and pin coupler, simply because it was an almost impossible thing to do, to change out all the link and pin couplers.

Q. Do you mean by that, so they could connect a coupler,—link and pin coupler, with one of the automatic couplers?

A. Yes, sir.

Q. That is perhaps what you meant when you spoke about using them interchangeably in connection and together that way?

A. I don't remember having that thought in view.

Q. That was a fact at any rate?

A. Yes, sir, I guess about 1897——

Q. Was it practicable to work them together that way?

A. Yes, sir, of course, it didn't fully comply with the Safety Appliance Law.

Q. I am speaking of practical railroad operation, what time did you say they began to come into general use?

4887 A. About 1893 or 4.

Q. Were any other changes made in draw bars besides that at the end of it?

A. In some cases,—not necessarily; the shanks were made to replace the M. C. B.—Master Carbuilder's—interchangeable coupler.

Q. Was it practical to convert the link and pin coupler into an automatic?

A. Yes, sir.

Q. Where did the difference occur between the old draw-bar link and pin and the draw bar that had the automatic coupler?

A. The difference was largely—practically all the difference excepting re-enforcing and improving of the draft rigging, is in the head of the coupler.

Q. To convert it from link and pin into the device that would work automatically?

A. Yes, sir.

Q. Was there any difference in the shank of the draw bar?

A. Not necessarily.

Q. Did the automatic type have the cushion behind it also?

A. Yes.

Q. And have the spring and yoke just as you have described it in the other type?

A. Many of them did, and many of them had what they called the twin or tandem spring; thus, for your information I

4888 would state,—this safety device, especially the vertical plane coupler, brought about wonderful changes in our draft gear.

Q. How were the draw bars attached to the draw sills—I mean in connection with the automatic coupler.

A. We didn't change the draft sills if they were in good condition; if all other draft attachments were in good condition, our draw bars were made to suit our equipment.

Q. And you bolted them through as you did the others?

A. Yes, sir.

Q. Were the connecting roads used with the draw bars that had the automatic couplers as with the link and pin?

A. I don't think they were with the Iron Mountain, but I did find them on the Kansas City Southern; the American Continuous Rod used in connection with the automatic coupler.

Q. The draw bar of the automatic coupler then consisted as I understand you, of the devices in the front, which constituted the coupler, then it ran back,—a casting at the shank—it was attached to a yoke, inside of which was a spring together with the front and rear plates, as you described it awhile ago, that is what the draw bar consisted of, wasn't it?

A. The only part of the draw bar that is in the automatic, it is either malleable iron or steel.

Q. It is a solid piece from the front where the link and
4889 pin or device for automatic coupling is, to and including the end you call the shank?

A. Yes, sir, excepting the hook, the knuckle that is attached with a pin, that is what makes the automatic connection, instead of the link and pin, that hook goes around.

Q. What I asked you is, if the part was the same as it was with the link and pin, except the changes made in the front end of it?

A. The shank is made the same as the link and pin, the master car builder's coupler.

Q. Then you say it was attached, in the Iron Mountain equipment here, attached to the draw sill or to the same timbers?

A. Yes, sir, attached very similar.

Q. Is that a complete description of both types of draw head?

A. I hardly — how *how* to answer that question; I think it is a very crude description; I could describe it better if you would let me take a pencil and a piece of paper, simply because if Mr. Rosing will put the questions, I will describe it because he is a mechanic and will describe how to put them; I would make a very poor job examining Judge Moore on the law.

Q. Any crudeness there is in it is owing to my ignorance of the subject.

A. I am trying to explain so you will understand it.

Q. What are the contributing causes to that part of the
4890 expense of car maintenance, which is chargeable to starting and stopping?

A. Is it your idea to separate the two; what is the causes of damage from stopping, and the causes of damage in starting—they are different.

Q. State them separately, if they are?

A. The greatest difference caused by stopping the train to the vehicle, with our power brake, is the brake shoes, wheels and brake attachments, such as levers, and pins, and the car brasses.

In starting a train, all those parts are at rest practically; there will be your draft rigging in starting,—all draft attachments, and the body bolsters, their center pin connections, the truck, etc.

Those are the principal parts damaged in those two operations, but they are not similar; the parts affected in stopping are not the parts affected in starting.

Q. You spoke of center pins, what do you refer to?

A. That is where the car body bolster—there is two body bolsters in the car and two truck bolsters; the center of the body bolser sets down on the truck bolsters; there is where they get their greatest

thrust, unless they get off the track—is in starting, simply because there is where the car body has to move the truck.

4891 Q. Which contributes more largely to the cost of maintenance,—starting or stopping?

A. Maintenance of equipment?

Q. Yes?

A. Starting.

Q. Why is that so?

A. Simply because it throws the stress or tension on the entire draft rigging, and parts connected to it, which in the stopping is absolutely released.

Q. To what extent is that strain that you speak of affected by the weight of the loads, the cars?

A. That is increased very materially. I had made or joined in making some tests of that nature, Col. Moore, but the data escapes me now.

Q. Just state in a general way?

A. To make it intelligible, I would not undertake to express an opinion of what ratio of increase of expense would be attached to the increased tonnage.

Q. Is it negligible or considerable?

A. Where the variance in increase of tonnage of train is concerned, it is considerable, between the minimum and maximum,—very considerable; as I stated in my examination yesterday, each individual vehicle in the train has to take their proportion of the damages that applies to stopping; in starting, it is not the case.

Q. In the damage in starting, the damage grows fundamentally out of the strain produced by the great weight that is necessary to be moved.

4892 A. Yes, sir.

Q. And I take it from what you said just now, as that weight is increased the strain would increase proportionately?

A. Yes, sir.

Q. Take a train of ten cars, each car weighing 20 tons and put it opposite a train of the same number of cars, each car weighing sixty tons—that may be extreme but it illustrates what I want; I suppose that the strain and the injury from starting, liable to accrue in the two cases, would be very much larger in the train that was made of cars weighing 60 tons than the cars weighing 20 tons?

A. That would depend largely on the construction of the car; if the 20 ton car—if that was its mazimum capacity.

Q. I am just talking about the car itself; leaving out all loading; I don't give that as the correct weights of the cars; I give it to illustrate.

Mr. HILL: Go ahead and complete your answer.

A. Ten cars of 20 tons each.

Q. And 10 cars of 60 tons each; I mean the cars themselves weighing that.

A. I don't think there would be very much damage in either case in starting those.

4893 Q. Whether it is much or little, I want to get whether it would be relatively to the weight?

A. To what,—to the cars?

Q. Yes?

A. It would not be any greater damage to start a sixty ton car than a twenty ton car.

Q. Wouldn't it require a greater force in motive power, in the power that starts it, to start a train weighing a thousand tons than it would require to start a train weighing one hundred tons?

A. But where you are speaking of the car and the car weighing sixty ton, that is built in proportion, and it won't suffer from being started, any more than the car that only weighs 20 ton.

Q. You don't understand the point of my question; the question I asked you is this; what is the effect of increasing the weight of the car or car's contents—of increasing the weight of the car, upon the strain involved in starting it?

A. It requires greater effort.

Q. And doesn't that greater effort produce a greater strain on the car?

A. It produces a greater strain on the car, but where there is that difference between the weight of cars, and if the car is built to stand that increased strain, and simply because a twenty ton and sixty ton car are stopped, there is a factor of safety in each case,—a

4894 sixty ton car won't be damaged any more in starting than a twenty ton car.

Q. What is the initial—the original cause of strain that is put upon the several cars embraced in the train,—what causes or brings about the strain put upon cars in starting?

A. The effort required to start the load.

Q. What represents that effort?

A. The locomotive.

Q. That is the visible representation of the effort?

A. Yes, sir.

Q. What effect would the differences in the power necessary to be exerted between moving a light and a heavy load, have upon the strain that is put upon the cars?

A. Well, there would be a difference, but what the ratio would be, I couldn't tell you off-hand.

Q. In point of fact, it is true, isn't it, that the strain and resulting damage, if you confine it to damage—to cars from starting, depends in its ultimate analysis upon the amount of force that is employed in moving it?

A. Not entirely, no, sir.

Q. I didn't say entirely; that is one of the elemental properties that enters into it?

A. Yes, sir.

Q. Isn't it the largest element?

A. No sir.

4895 Q. What is it that is more important?

A. The abuses it is subjected to.

Q. What do you mean by abuses?

A. I mean by abuses, rough handling, and irregularity in the track.

Q. Assume that it is handled properly, and the track is properly constructed, isn't the initial force exerted in moving an object, any standing object, the primary cause of the strain, and the largest element of strain that is put upon it?

A. Yes, sir.

Q. What I mean is that; if you have a train of cars—say 20 cars, loaded to their capacity, and in front of those cars you have an engine with a given tractive power,—you have another train made up precisely in the same way, the same cars, and same weight, and upon a track exactly similar, with in front of it another engine, with double the tractive power of the one I first mentioned, which would make the greatest strain in moving that train, the engine with the lighter or greater tractive power.

A. Same train, same weight?

Q. Yes?

A. I cannot see that there should be any difference.

Q. Why not?

A. Simply because it is not necessary for the engine because it has the power, to exert it.

4896 Q. Suppose the power is exerted?

A. I cannot see that.

Q. It may seem not reasonable to you?

A. It is impracticable.

Q. You have one train that requires a given tractive power to move it?

A. Yes, sir.

Q. And you have another train with precisely the same conditions, as far as track is concerned, which requires three times the tractive power to move it, and therefore, an engine to exert three times the tractive power of the one I mentioned, which one will put the more strain on the cars to move it?

A. The one that has three times the tractive power, that requires three times the tractive power to move it.

Q. What is the ratio of difference between them?

A. I don't know what the ratio is.

Q. Take the two cases I cited to illustrate; one train that can be moved with a tractive power which we will call one and another train that will require tractive power which we will call three; what I ask you is, which will put the greater strain upon the cars in the train #1 or 3?

A. Number 3.

Q. Why.

A. Because it requires it to move it.

4897 Q. And that additional exertion of force will necessarily put a larger or greater strain upon every part of the object which is resisting the movement?

A. Every part that is brought into use, as a part of the draft rigging and attachments, yes, sir.

Q. Of course, there is the necessity for the power; that is exerted

in moving any standing body, which is the resistance that that body itself affords; the greater the resistance, the greater the power necessary to be exerted in order to overcome it?

A. Yes, sir.

Q. And the strain increases correspondingly upon those parts that make or exert the resistance?

A. Yes, sir.

Q. And the strain or its effect will be proportionate to the increased tractive power necessary?

A. The strain will, yes, sir.

Q. Now, we'll take up the next element—you have spoken of starting, now the next element is stopping; express your views on that question; I asked you how the damage is produced and you have taken up starting and you referred to that, giving how the damage is produced on that.

A. The parts generally that receive wear and tear and damage in stopping—I do not call that damage but cost to maintain, as a result of stops.

Q. I am speaking of cost of maintenance as a result of stopping.

4897½ A. Brake shoes and wheels and brasses and brake rigging, levers and pins.

Q. Take those up in detail and explain how the damage is sustained on each one, say the brakes?

A. I don't know what you want me to say.

Q. I want you to tell me how the brasses are affected by the stopping of the train of cars.

A. The brakes being applied on the outside of the wheels, or on the inside, whichever the case may be, when the pressure comes against the wheels, it changes the position of the journal in the bearing entirely, simply because if you have an inside brake, you will press both wheels out, just like driving a wedge in between them, and if it is an outside brake, you are pulling the wheels together, which is not their normal condition when the car is either standing or moving, without the brake set.

Q. Is that increased or diminished by the momentum or weight of the object to be stopped?

A. Yes, sir, to some extent; I would give it as my opinion that it was increased.

Q. By both?

A. By the greater weight of the car, and the greater speed.

Q. The brakes now, how are they affected?

A. The contact of the brake shoe and the wheels, the wheel
4898 and the brake shoes both wear, as a result of the brake shoe being in contact with the wheel in stopping the train; that is what wears the brake shoes out, and of course, the pressure being transmitted to the wheel, through the brake shoe, from the brake lever, and from the brake beam, naturally throws the shearing strain on the parts.

Q. Do you mean that that is a factor in that way?

A. In the stopping, yes, sir.

Q. Does that effect increase or diminish by the momentum and weight of the body to be stopped?

A. Yes, sir, the wear is increased by the high velocity which the train is moving, and the greater weight when the brakes is applied.

Q. What effect does the slack, what you call slack in the train, have upon the force necessary to be exerted in starting a train?

A. Well, it has a helpful effect to the head end, but a very damaging effect to the hind end.

Q. Explain that now.

A. If there was no slack in a train of 40 cars containing 1200 tons, with a locomotive attached to it, it would be almost impossible to get a locomotive of sufficient power to start those 1200 tons without some slack.

Q. That is what I want you to explain to me, how the slack helps it?

A. The slack assists the locomotive in starting the train, and a small amount of slack, I don't think is a damage to the train,
4899 but excessive slack, that was the result of the link and pin coupler, contributed very largely to the damage and wrecks.

Q. Explain to me how it did, in what way it contributed to it?

A. You take a cord and lap it between your fingers and you haven't enough strength between your two arms to break it—you take a cord that has a maximum strength to resist all the power you have in your two arms—but you take it and give it a quick jerk, and it will break; that is my illustration.

Q. I thought you said the slack paid out gradually and avoided that jerk?

A. No, if I did—I say the slack helps the locomotive.

Q. Isn't it this; isn't the greater injury which you say accrues, to the more remote cars from the engine, the result of increase of force that bears on it by reason of the momentum and velocity of the cars before it, in connection with the power of the engine?

A. I don't understand that question.

Q. What I mean is this: You exert the power necessary in your engine to start the cars next to it; those cars gain a velocity; then directly they gain a little more momentum, and that power is added to the power of the engine, and as you go back, there is a larger power produced upon the rear cars than the front, isn't that what produces it?

A. No, sir.

4900 Q. What is it?

A. If you have slack and slack extends all the way to the rear of your train, your locomotive perhaps has not power—the slack between the locomotive and the first car is not sufficient to pull the locomotive away from that car, but as she starts four or five, the slack increases, and as you go back a number of cars from the engine, you have the weight of the locomotive and all those cars on the others behind that slack, that has already increased, and that is just what I illustrated by the piece of string.

Q. That is just exactly what I submitted to you a minute ago; that is precisely the illustration I gave you.

A. But you have no slack with the vertical pin coupler.

Q. I am not talking about that; I am talking about slack; what kind of force would be required to move a train of 50 cars, that had no slack—50 loaded freight cars, that had no slack?

A. On level track?

Q. Just the ordinary track.

A. That is a mathematical question that is unfair to ask, unless you will give me time.

Q. I don't mean for you to answer it in figures; I mean, a greater or medium or low?

A. I don't know; I have pulled 110 cars with a locomotive 19x24, ten wheel engine, only carrying 160 pounds of steam, stop-
4901 ping and starting.

Q. The point I want to get at is this, whether a smaller tractive power would move a train where there is slack and where it pays out gradually from one car to another, than would be required if it was all made up with cars without slack?

A. It is possible to move more cars with the same engine or a greater tonnage, made up of a number of cars that has slack, than it is if the tension is tight up between them.

Q. I understood you to say awhile ago, if I misunderstood you, you can correct me, that assuming you wanted to move a train of 1200 tons on tension, without any slack you could hardly imagine the power that would be required in an engine to do it?

A. Yes, sir.

Q. Did I understand you correctly?

A. No, sir, I asked you, could you imagine it?

Q. What do you mean by that; didn't you mean it would be a difficult thing to do?

A. No, sir, because it is done every day, I expect, because the heavy tonnage trains with large tractive force in the engines, the question of slack is one that assists the engineer, but it is very injurious to the railroad company sometimes.

Q. In order to clear up any misunderstanding there is between us, would it require more power to move a given number of
4902 of cars in a train where there is no or very small amount of slack, than if it would with a larger quantity of slack?

A. To start them, yes, sir.

Q. Would it be practicable for you to give me an idea as to your view as to what the ratio of power would be, in such a case?

A. I couldn't do that; wouldn't attempt to do it, without a thorough test to get the draw bar pull.

Q. Are there any tables to cover that?

A. No, sir, but it could be ascertained by the use of the dynamometer car; those draw bar pulls, under different conditions are worked out accurately by an instrument made for that purpose.

Q. There is no fastening or attachment between the draw bars where you use the automatic couplers, such as there was with the link and pin?

A. Not to my knowledge, only as the connection is made between the center sill or draft sills.

Q. At the point where they couple together, at the point where the draw heads couple together, there is no connection——

A. No, sir, only the friction.

Q. If a draw bar is pulled out, one of the draw bars pulls out, it necessarily invariably falls on the track in the automatic draw bar?

A. They might if the yoke broke; there is a yoke or

4903 carrier that runs underneath the draw bar, just behind the coupler head proper, that carries the weight; if the shank broke off, it could slip over that yoke, but if the spring yoke was on the end of the shank, it could not.

Q. What I want to bring to your attention is this; when a draw bar pulls out, with the automatic coupler, it is more liable to pull out and fall on the track than the link and pin coupler?

A. No indeed.

Q. Isn't the link and pin coupler attached together; even if one of the ends should draw out, does not the link with pins hold them together?

A. They do sometimes, but they break.

Q. They do sometimes; it cannot possibly ever occur that way with the automatic coupler?

A. No hardly; I wouldn't think it could.

Q. What I mean is this; if a part that is entirely detached from another part breaks off, it cannot be held up by the other part?

A. No, sir.

Q. That is exactly the condition when one of the ends of a draw bar in the automatic coupler breaks?

A. I never recall of seeing an automatic draw bar pull out, but I have seen them broken off; the head broken off in the neck and fall down on the track.

Q. Hasn't there been very many devices patented to pre-

4904 vent vertical coupler devices falling down on the track when they break?

A. Not to my knowledge.

Q. You don't know that is a fact?

A. No, sir.

Q. You spoke yesterday about the increase in size of the cars, what has been the average increase in size of cars, what had it been up to within ten years, during the ten years before you quit railroading in 1904?

A. Their carrying capacity had been doubled, I will say, judge. Ten years before I quit railroading, a sixty thousand capacity car was considered practically the maximum—when I quit railroading, it was no uncommon thing,—in fact, I guess the greatest bulk of new freight equipment that orders was placed for, were specified a hundred thousand; probably in box car construction, eighty thousand.

Q. Forty to fifty tons?

A. Yes, sir, one hundred thousand gives a miximum loading of one hundred and ten thousand.

Q. The maximum loading ten years before that, would have been about sixty thousand or thirty tons?

A. When?
Q. I understand you to say ten years before?
A. Yes.
Q. There was an increase from six to ten?
A. Yes, sir.
4905 Q. That would be 3/5ths, I believe, in capacity?
A. Yes, sir.
Q. What increase in weight of the car was represented by that?
A. As a rule, in as great a ratio as the increase of the car capacity. The efforts of the designers of the Mechanical department was to design a car that required as little dead load as possible; the ratio of deed load as compared with the revenue tonnage was reduced, to the lowest possible limit; a sixty thousand capacity car, built about 1894, of course the type of cars, the weights would vary differently; that is, a gondola car,—coal car—would be very different from a box car that is the same capacity; a sixty thousand capacity box car would weigh about from 26,000 to 31,000.
Q. 26 to 31, you say?
A. They would run from 26 to 31. Metal construction has entered into that a great deal; a hundred thousand capacity car, of course, the dimensions would affect the weight considerably, 40 foot long, would weigh about from 38,000 to 42,000.
Q. That was an increase then of from 26 to 38 and 31 to what?
A. From 37,500 to 42,000. However, I think my friend Rosing will be able to give you more specific data in that direction
4906 than I can.
Q. What changes have been made in the construction and tractive power of engines, to enable them to pull those largely increased weights that are carried in cars having a capacity of 50 tons.
A. The tractive power of locomotives of general design, high steam pressure, has necessitated that, the weight be economized as far as possible, to save the structures; the tractive power of locomotives has been increased in about the same ratio or perhaps even greater ratio. While I wouldn't assume to be exact on that, simply because I have been away from those things for six years——
Q. I am speaking about the time you went out of the service?
A. Yes, but I have not been thinking about those things.
Q. I want to get at your idea about how the ratio of increase in tractive power of engines, compares with the ratio of increase in capacity of car?
A. Well, giving the people in charge of the mechanical departments on different railroads in the country—I would give them credit for exercising the proper judgment and increasing the tractive power to take care of the increased tonnage they were expected to handle.
Q. If the increased capacity of cars exceeded, as you said
4907 awhile ago, and was in larger ratio than the increase——
A. Not the increase of weight of the car proper.
Q. It would require—a larger ratio of increase in the engine than there would be required in the weight of the car, wouldn't it; I

mean, in the tractive power of the engine than in the weight of the car?

A. No, sir, I don't see any connection between the two.

Q. The engine has got to pull a given load, the load has nothing to do with the weight of the car, except as it adds to the total weight of the car and its contents?

A. Yes, sir.

Q. If you increase the weight of the car, we will say, 5%, and thereby increase its capacity 10%, you will have increased the weight of the car and its contents in a greater ratio than you have of the weight of the car alone; the engine has to pull them both, and what I want to ask you is, if it wouldn't require a larger ratable increase.

A. I cannot see where that applies, if you would call it all car load and all, what would be the difference.

Q. The difference that occurs to me is this; you might have a load that one horse can pull; you might have a load too large for one horse and it takes two—when you get a load that is too large
4908 for one, you *you* add another,—as you increase your load, you have got to increase your power to move it, as you increase the load of your cars?

A. The load of the train, but the load of the individual car you are speaking of, is two different propositions.

Q. I speak now of a train composed of cars?

A. The weight of the equipment is taken in consideration when they are loading the locomotive.

Q. Take two trains, one of which weighs 1200 tons, and the other one weighs 600 tons, which will require the largest tractive power to move it?

A. The one weighing 1200 tons will require the greatest amount of power exerted.

Q. If you increase the capacity of the cars, and don't increase their weight in proportion, you have got to increase the tractive power of the engine to cover both increases, haven't you?

A. No, sir, you don't have to increase the tractive power of your engine; you just cut a car off. I cannot understand where the connection comes between the car—it is my ignorance perhaps—where the connection comes between the individual car and the locomotive or the construction of either.

Q. I imagine that locomotives are constructed and changes in the construction of locomotives, are for the purpose of increasing their capacity; that is for the same reason as in cars—that is
4909 to pull the largest amount of cars that can be pulled by an engine?

A. The largest amount of paying tonnage.

Q. That is why you increase the capacity of the car; the question I asked you—you stated awhile ago, that where the capacity of the car is increased from 60 to 100 tons, the proportion is not preserved in connection with the weight of the car?

A. Yes, sir, the carrying capacity.

Q. I say you built an engine to carry just the number of loads

of that kind that is practical to operate an engine in front of, in order to do that, you have got to adjust the tractive power of your engine to the loads it hauls; if the tonnage is increased in a larger ratio than the weight of the car, isn't the power of the engine increased in a larger ratio than the weight of the car—of the several cars that make up the train?

A. I cannot see the connection.

Q. I will put the question another way; if the capacity of a car is increased and the weight of the car is not increased in proportion to its capacity, wouldn't it be necessary to increase the power of the engine in greater proportion than the increase in weight of the car?

A. I didn't mean to say that the capacity of the cars were increased in greater proportion than the weight of the
4910 car.

Q. That is what you said?

A. Well, yes, sir, I said it, but I want you to understand, and then I will answer your question—I won't attempt that now.

Mr. HILL: Go ahead and make your explanation.

A. My friend Rosing is trying to get Col. Moore to trip me; Mr. Rosing knows that he has staid up nights figuring on how to construct a car to increase her carrying capacity without increasing the dead weight of that car at the same ratio as he did the carrying capacity; that is what railroads sometimes keep people to do.

Now, in answer to Judge Moore's question here, it is necessary to increase the tractive power of a locomotive, just because they have increased the carrying capacity of a freight car,—I yet cannot see any connection whatever.

Mr. HILL: Let me ask one question there; are you speaking of that from a maintenance standpoint or from the operating standpoint?

A. From the standpoint of the best interests of the railroad company in every particular, both in first cost of maintenance and earning capacity. That aint the way they done on the Illinois Central though.

4911 Mr. MOORE:

Q. Were the 12 wheel engines in use on the Iron Mountain when you quit service?

A. Yes, sir, nearly all our freight engines were 12 wheels in two types,—ten wheel engines with six drivers——

Q. How did the power of those engines compare with the power of the engines used in 1890?

A. On this division, in 1890, when I came here as master mechanic, they had no—did you ask me 12 wheel locomotives or ten?

Q. 12 wheels?

A. I am in error, we had no 12 wheel locomotives.

Q. At what date do you speak of?

A. At no time during my connection——

Q. Were the 12 wheel locomotives in use at the time you quit?
A. No, sir.
Q. Were you acquainted with the 12 wheel locomotive?
A. No, sir, not in a practical way.
Q. You don't know their capacity?
A. No, sir.
Q. Did they have ten wheel locomotives?
A. Yes, sir, ten wheel consolidation type, eight driving wheels and one pair of pony trucks, and another type with six drivers and four wheel trucks.

4912 Q. When did you begin railroading?
A. In 1873.

Q. How did the engines you mentioned in your last answer, compare in power and capacity with those in use when you begin railroading?
A. They were about 30 years ahead of the west; in 1874, I was messenger on two locomotives that went to Renova, Penn., that were the same type of locomotives they are buying—I see new engines come in on the Iron Mountain now,—except they are larger now; they were the consolidation type, four driving wheels, and one pair of pony trucks.
Q. Is the air brake which you referred to awhile ago, applied on one or both trucks of a car?
A. Good practice is to apply it to all wheels.
Q. How was it with the old hand brake?
A. The old hand brakes, some had single and some double brakes; sometimes one applied to one truck, and sometimes,—depending largely on whose road the cars belonged on.
Q. How was it with the Iron Mountain?
A. The Iron Mountain cars—their owned cars, were nearly all equipped with what we called the double brake, the brake connected with both trucks.
Q. I believe all freight trains now are equipped with air brakes, that is the universal practice on large roads?

4913 A. Yes, sir, I believe so.
Q. This brake attachment, these brakes are attached to each car in the train, are they not?
A. Yes, sir.
Q. Will you state how many parts of machinery, the air brake on each car consists of?
A. Two air brakes, hose and couplings, consisting of 16 parts; two angle cocks, consisting of 16 parts; one train pipe, consisting of two parts; one strainer, consisting of five parts; one cut out cock, consisting of five parts; one triple valve, consisting of 34 parts; one air reservoir and brake cylinder, consisting of 16 parts. One retaining valve, consisting of 7 parts; one release valve on reservoir, consisting of 6 parts; one branch pipe, consisting of two parts; 4 clamps to secure train pipe, consisting of 8 parts; one pipe from triple release to retainer, 2 parts; one release pipe union, consisting of 3 parts; total 122 parts.

Q. Does the sheet I hand you contain a cut of the triple valve?
A. Yes, sir.

4914 (Here follows cut marked p. 4914, omitted in printing.)

Mr MOORE: It is agreed that copies of cut referred to in the last question and answer, will be furnished the clerk to be used
4915 in making up the transcript, if it should be necessary to prepare a record for appeal in this case, and that the duplicate copies may be used in the record.

Q. This brake is for the purpose of conducting and applying compressed air, is it not?
A. Yes, sir.
Q. Do the parts necessarily have to be made and maintained air tight?
A. Yes, sir.
Q. And all those parts you have mentioned are attached to a car—that is every freight car?
A. Yes, sir.
Q. All those parts perform a service every time the brakes are set to make a stop, do they not?
A. Yes, sir.
Q. This air brake has all been added to the cars since the day that Mr. Wellington wrote his book in 1877?
A. The automatic.
Q. I speak of this device I have called your attention to?
A. Straight air was used before, but it was not applied to freight equipment.
Q. These appliances I have called your attention to, have been added to freight cars since that time?

A. Yes, sir, all air equipment,—has been added within
4916 the last twenty years I guess.

Q. Have you ever read Mr. Wellington's book, are you familiar with it?
A. Yes, sir, but it has been several years since I read it, not having any occasion to.
Q. You spoke of contributory damage, on account of drawing out of drawbars, and that you had known severe and expensive freight wrecks as a result; you are referring to freight wreck damage?
A. Yes, sir.
Q. What is the wheel base of the large freight cars now?
A. Do you mean the total wheel base, or the wheel base of the truck?
Q. The total wheel base?
A. I don't know now.
Q. Didn't you state yesterday the trucks were about 25 feet apart?
A. From center to center, I said practically.
Q. The wheel base would be counted from center to the outer wheel?
A. Yes, sir.
Q. That would make it about 32½ feet.

A. I don't know what the centers are—33 inch wheel, the truck oughtn't to be more than 5 foot six and the centers,——

Q. That would be 30½?

4917 A. Yes, sir.

Q. What is the wheel base of the engine, the driving wheels of the engine?

A. The total or driving wheel?

Q. Driving wheel.

A. The consolidation engine, the driving wheel engine base is about 13 feet six, or 13 feet; it depends upon the diameter of the wheel.

Q. You stated in your examination in chief, that a locomotive is derailed, excepting the tender, less than any vehicle in the train, owing to its being counter-balanced and the weight equalized; now in view of the wheel base that you have given of the car, as compared with that of the engine, can you say that the weight is as well equalized on the engine as it is on the car?

A. Did I state it in that way?

Q. Here is your testimony.

A. It is in there, but not in the way I understood you to read it; the "locomotive is derailed, excepting the tender, less than any vehicle in the train, and owing to a locomotive being counter-balanced, the weight equalized, so that it can transfer from one wheel to the other, to take care of the irregularity of the track, which is not the case with a freight car, load- *it* with—I

4918 didn't say that was the reason it was derailed less, I just made the statement that it was derailed less than any other vehicle in the train.

Q. Is it a fact that the weight is equalized, in view of your statement of the relative wheel base of a car and engine, as well on the engine as it is on the car?

A. That is misleading. The weight of a locomotive is better equalized on its wheels than it can possibly be on a freight car; there is nothing said about the distribution in that.

Q. What is the distribution then?

A. The distribution on the track or on the structure, a given length of track has to maintain a greater load under a locomotive than it does under a freight car, but owing to the system of equalizers, and springs, the wheels compensate themselves; the load don't shift, but the wheels shift; the wheel will come up and the locomotive won't come up; if the freight car wheel goes in a hole, the car goes in a hole.

Q. Is the car without any springs at all?

A. No, sir, it has springs too but no equalizers.

Q. What is the equalizer?

A. It is that, that transmits the depression from one point to another.

Q. Describe it to me?

4919 A. That represents the three wheels of a locomotive on one side; there is a spring on top of the box; those are equalizers running from one spring to the other; these saddles running

down through the spring to the driving box, which rests on the wheel; when the wheel goes in a hole, this spring goes down, but the locomotive don't go down, simply because these two holds it up. I have seen those in that position, but your locomotive is standing level, simply because the locomotive is swung on a spring,—that is, on these equalizers; the car construction is altogether different; the car sets on a four wheel truck, on a bolster that has springs, and they have no connection with the wheels at all; the springs are nothing only compression springs.

Q. A very much large- number of cars, of course, are used in freight service than engines?

A. Yes, sir.

Q. Do you say that more cars are derailed in proportion to the number of cars used, than engines in proportion to the number of engines used?

A. Yes, sir.

Q. You stated yesterday, in the same connection, that "Take a one hundred thousand capacity freight car, load it with one hundred and ten thousand pounds of lading, weighing about 140,000 pounds of itself; it has eight points in contact on the rail, distributed from one center to the other."

You meant to state there, didn't you, that the car and
4920 contents weigh 140,000 lbs.?

A. That is what was contemplated.

Q. So the weight of that car and its contents is 140,000 lbs.?

A. Yes, sir.

Q. Now, that is a modern car you are talking about?

A. Yes, sir.

Q. What would be the weight of the old type of car and its capacity, before their capacity was increased and its contents according to its maximum capacity; I want to get the increase of the weight of the car and its load?

A. A 60,000 capacity car, as I stated,—box car, and gondola cars vary, there is a difference between the dead weight of the car for a given capacity.

Q. Well, say 20 years ago, 25 years ago, in the times that Mr. Wellington wrote, 1877.

A. 25 years ago, there were no 60,000 capacity cars on the Iron Mountain.

Q. What were they?

A. Most twenty and thirty and forty thousand capacity.

Q. What would be the weight of the car itself?

A. I don't remember; the most of the Iron Mountain equipment 25 years ago, freight equipment was not to exceed twenty to thirty thousand capacity.

Q. What was the weight of the engine of those times?

4921 A. The weight of the engines those days, was about sixty thousand pounds, from 26 ton- to 35 tons.

Q. Now, the cars have increased until they have a capacity and weight with their contents that you mentioned in the latter part of your testimony I quoted you awhile ago, 140,000 lbs.?

A. Yes, sir.

Q. Isn't it a fact that the weight of those large engines now, is over 200,000 lbs.?

A. Yes, sir.

Q. So the weight of the engine has been increased in a very much larger ratio than the weight of the car and its capacity?

A. I guess they have.

Q. I hand you a circular, called general instruction #16-*a* of the Iron Mountain Railroad,—Missouri Pacific and Iron Mountain Railroad, classifying the lines over which various locomotives on the system may be operated,—the bridges have been divided into four classes; the number of the engines which may run over each class of bridges are given; "Engines not listed in this table shall not be run over these bridges without special authority from the Chief Engineer Maintenance of Way."

Will you attach it as Exhibit K-1 to your deposition?

A. Yes, sir.

4922 For Exhibit K-1, see Vol. 9, page 5884.

Q. Why is that classification made?

A. Owing to the condition of the structures, I suppose.

Q. Look over it and explain to me in what way the condition of the structures would render it necessary to issue that circular?

A. I am not familiar with these locations.

Q. Isn't it because there are certain parts of the line, and certain structures, in the way of bridges, that it would not be safe to run certain classes of engines over, which are excluded from certain parts of the line and bridges over them?

A. It is because the condition of the structures won't warrant operating that heavy a locomotive over it.

Q. Is there any such classification or exclusion in regard to cars?

A. Not that I know of; I don't know of any such instructions being issued.

Q. Did you ever know of such instructions in regard to cars?

A. No, sir.

Q. What do you refer to when you speak of a locomotive being counterbalanced?

A. I mean the wheel made so to counteract the weight of the crank pins and the proper proportion of the weight of the rods, that is attached to the pins in the wheel.

4923 Q. Why is it necessary to make any particular construction for that purpose, why is there any construction of an engine that renders that necessary to counterbalance it.

A. There is not anything in the construction of the locomotive that renders that necessary, but for a locomotive to be constructed properly, it is necessary for that feature to receive care and attention.

Q. That is the question I asked you, why is that necessary?

A. That is to avoid the hammer blow, that would result from that part of the wheel coming down and hitting the rail.

Q. That is what you call pounding?

A. It is generally termed the hammer blow.

Q. I frequently hear the expression made as pounding; Mr. Alexander used it yesterday; that is what is referred to when they say an engine is pounding?

A. If I would speak of an engine pounding, I would think that was in the machinery of the engine, pounding in the boxes.

Q. You call it hammering?

A. I call it the hammer blow on the rail.

Q. What effect does that have, what tendency does that have toward derailing engines?

A. It might contribute to derailing by breaking of rails—
4924 something of that kind, but I don't think that that would have any tendency to derail the engines.

Q. Do engines bend rail?

A. Yes, sir.

Q. Do cars?

A. I don't know, not to my knowledge.

Q. What causes that hammering, that you say has to be remedied—you said but for this counterbalancing it would produce a hammering on the rail?

A. It would produce a hammer blow upon the rail from revolution of the wheel.

Q. What is it that produces that?

A. Becaues one side of the wheel is heavier than the other.

Q. Why is that?

A. Because it carries the crank pin and proportionate weight of the rod that carries the crank pin.

Q. Tht destroys the balance of the wheel?

A. It would, if it wasn't properly balanced.

Q. Unless it is guarded against, it will destroy the balance of the wheel?

A. Yes, sir.

Q. What is the weight of that crank and rod?

A. I don't know; you give me the specified engine, and I will give you the weight.

Q. I mean the usual engine—just take an average?

A. I cannot tell you; I don't think it is fair to ask that
4925 kind of question either. There is a question there about the bent rail, I would like to ask you when you ask about a bent rail, in what direction is the rail bent?

Q. I don't know; you can state the direction yourself.

A. Locomotives have bent new rails laterally and the bending vertically is done by soft track and weight of the cars or locomotives either, where the ties are bad, or not properly supported.

Q. If a locomotive bends a rail laterally, it is——

A. That is a defect in construction.

Q. Does that not sometimes result in derailing the engine?

A. I never knew of it; it destroys the rail.

Q. Do the builders of locomotives design their wheels for the purpose of counter-balancing the weight of the driving rod,—side rod?

A. Yes, sir.

Q. What do they do that for; in what way is that done?

A. By adding an increased amount of metal in the rim of the wheel, or between the spokes at opposite points.

Q. This side rod revolves, doesn't it, on the driving wheel?

A. No, sir.

Q. Doesn't the crank revolve?

A. Yes, sir.

Q. And the driving rod follows it up and down?

A. Yes, sir.

Q. And the end of the rod goes up and down with the revolutions of the crank?

A. Yes, sir.

4926 Q. What are the reciprocating parts of a locomotive?

A. The piston, cross heads and main rod—one half of the main rod, the weight of it is usually added in to the reciprocating parts.

Q. Now does that have any effect on the balance of the wheel?

A. Yes, it all has to be taken into consideration.

Q. What is the excess of balance created in that way—isn't there about 66% of excess of balancing created by these reciprocating parts—the piston and cross head and the piston rod?

A. I don't recall just what the ratio of weight is now.

Q. How does the piston rod move—it moves back and forth doesn't it?

A. Yes, sir.

Q. Now in view of these conditions to which I have called your attention, I want to ask you if it isn't practically impossible to produce a perfect balanced wheel?

A. For all builds, yes, sir.

Q. Doesn't that want of balance and want of reciprocation or want of balancing growing out of this rod and these reciprocating parts always produce that hammering of which you speak?

A. Should not.

Q. Did you say that engines that are used to-day, even properly constructed engines are free from hammering or pounding?

A. If the engine is properly constructed—counter-balanced for maximum weight, it should not do any pounding—should

4927 not deliver that hammer blow to any perceptable extent without operating it at a speed in excess for which it is counter-balanced for.

Q. Isn't it a fact that on account of this counter-balancing, that in practical operations railroad tracks are frequently very badly damage- by the pounding or hammering of the engine?

A. There was a time before the locomotive builders and railroad mechanics began to recognize that defect and cure it by proper counter-balancing the engine.

Q. Mr. F. P. Ward, the General Manager of the C. B. & Q. road testified in this case a few days ago, and Mr. Carl Gray, General Manager and Vice President of the St. Louis & San Francisco R. R. Co. also testified in this case afterwards, and both of them testified that was the case, and that the track was frequently very

badly damaged, and it may cause many times more damage than might accrue to it from any other causes by reason of improper balancing of the wheels producing the hammering—would you say these gentlemen were not speaking correctly—either advisedly or in any other way?

A. No, I would not, but I would say this, if such is the case, that locomotives were being operated at a speed in excess for which they were counter-balanced, over which Mr. Gray or these gentle-
4928 men have no control—I am speaking not only as a mechanic, but as a locomotive engineer. Take the same locomotive and run her over a bridge, especially a metal bridge on a frosty night, is when you will hear the hammering blow, you will never hear it going up hill.

Q. Isn't it a fact that this excess which I am informed is 66%, is divided between the driving wheels, on account of the reciprocating parts, does necessarily result in preventing any engines from being perfectly balanced at any time and at any speed it may be running?

A. No, sir, I don't think so.

Q. Isn't that excess balancing always in the wheel at any speed it may be going?

A. Yes, sir.

Q. Isn't it that which causes the hammering?

A. Yes, sir.

Q. You stated in your examination in chief that the engine has practically been worn out in through freight service, as a general rule, and it is then put in local freight service to be utilized there before going into the shop, to get all out of the engine that could be gotten out of it. You say on the same page that the expense for keeping the engine in service should be no greater than to keep a through freight engine in service?

A. Yes, sir.

Q. How can you reconcile the statement that an old engine
4929 that has been worn to the extent of 75% can be kept in service at as little an expense as an engine in through service—as the class of engine and the condition of engines that are used in the through service, as you have described there?

A. Simply because the service is not so severe.

Q. You say this, that an old engine which has been three-fourths worn out can be maintained at less expense in local service than the same engine put in new and up to the time it was put in local service could be maintained in through service?

A. I did not say that.

Q. I am asking you that now? Did you say that?

A. I did not.

Q. Isn't that the effect of your statement?

A. No, sir, I said it would not cost any more.

Q. What did you refer to when you say—what character of service in pulling through trains, did you refer to when you say the service is less severe on the local trains?

A. Not nearly so heavy tonnage, and practically operated in the

day time when the rail is good and the time is not so fast—the local freight service is slow schedule.

Q. You are the only witness, except Mr. Alexander, who has testified in this case on either side, who has made that statement, all the other witnesses on both sides have stated that between stations
4930 the local freight runs faster than the through freight. Isn't the speed of the engine—isn't it the speed of the engine that does it the damage rather than its load within its pulling capacity?

A. No, sir, not necessarily.

Q. What effect does the switching service have upon the engines that pull local trains?

A. They only have a very few cars—that is not severe service, and we could not put them in our terminals and take hold of heavy trains and switch with them.

I will give you an idea where I take a great deal of this from; I was an engineer in local freight service on the Iron Mountain road, and didn't go to a shop in a year. I did all the repairs, in fact, most of the engineers that were in local service that led away from shop terminals those days had to do that—did all the repairs themselves, even washing out their own boilers, and I know I am speaking from actual experience, both in operating locomotives and in after years careing for them.

Q. How long ago was that?

A. 1884.

Q. What road was it on?

A. Iron Mountain road.

Q. The character of the service the same as it is now?

A. There might be a few more stations on the same territory now, that was between Bismark, Mo. and Popular Bluff, Mo., over
4931 the hilliest part of the Iron Mountain railroad—a 17x24 engine, I ran her there for 13 months and she never was at a shop.

Q. She must have been an exceptionally good one.

A. They all did it them days. You spoke of Mr. Gray, whom I used to know very well, and also Mr. Ward,—I don't believe either one of them ever ran a locomotive or ever made repairs on a locomotive, or if they were supervising it, would know whether it was properly done or not.

I do not put myself up against them in their testimony, but what I say here, I say nothing but what I know, and if I don't know it I will decline to answer.

Q. Doesn't the operating man who is in charge of, and who is responsible for the expense of operation, while he doesn't run a car or doesn't fire an engine, does he not necessarily, if he is efficient in the discharge of his duties as operating official, keep a close watch on the operating expenses, or operation of the various departments, and in its application to various departments?

A. As a total, yes, but in detail, no.

Q. Do you say that Mr. Gray doesn't know what the cost is of the various branches of service that he superintends and directs?

A. I will answer that by saying this—Mr. Gray's reputation is no

better than Mr. J. T. Harahan's, and there was six million dollars that was reported that was charged up to repairs on the Illi-
4932 nois Central Ry, and they never discovered it.

Q. Who was General Manager at that time?

A. Mr. Harahan's son, I guess.

Q. Why didn't they discover it?

A. I don't know.

Q. It was reported to them?

A. It was reported the money was spent, and no doubt he would come up and swear it cost that much to maintain freight cars in that year.

Q. Do you believe that Mr. Carl Gray, from what you know of his character, would not have discovered that and remedied it, if he was in the position of the officers who ultimately discovered it?

A. I will say this, that Mr. Carl Gray has got to refer to figures that he receives from some one else.

Q. You are speaking about the officials to whom the information was taken that the peculation to which you refer was going on, and were informed, did not discover that, do you believe Mr. Carl Gray wouldn't have discovered it?

A. I am not putting it in that way.

Q. That is the way you did put it.

A. No, I did not.

Q. The evidence in that case shows those things were reported——

A. I know J. T. Harahan would never have permitted
4933 a thing of that kind if he had been cognizant of it—a man whom I have known for thirty years, and he didn't like me at all, but he would not have had a thing of that kind going on. He is reputed to be as bright as any railroad man we ever had in this country too.

I know from my own experience, the man who spends the money is not permitted to distribute it—distribute the expense. I, as Master Mechanic over here, was not in position to say that so much money was spent maintaining such and such a locomotive, but it was bunched by reports, go to St. Louis—those reports are consolidated in the Auditor's office and they distribute such expenses, so much to switching, so much to local and so much to through freight, so much to passenger and so forth, that was my experience here. A general Manager in all good faith could say those figures were so and so, but they would not be so, because they do not reflect the actual expenditures.

Q. Do you know how these accounts and expenditures were kept in 1907 on the Iron Mountain Railroad—you have just now stated everything was bunched?

A. No, I do not, I wasn't here.

Q. Isn't the superintendent of a road—I don't mean the General Manager, but I mean the superintendent,—on the road back and forth on his line all of the time, and isn't he in a position to acquire a knowledge of the details of the business—I am referring now to Division superintendents.

4934 A. Never on any road that I was ever connected with.

Q. These gentlemen you have spoken of went up through all the various grades—I don't remember now, but Mr. Ward was in a great number of grades, Mr. Gray in not so many, Mr. Gray was Division Superintendent of a railroad, and Mr. Gray testified that his experience justified him to testify about these matters, would you say his statement in that respect was not true?

A. No.

Q. That was his own statement.

Q. I would just say that it was just an error in his judgment, that is all, I don't believe Mr. Gray would testify to anything he believed was untrue.

Q. When you were Master Mechanic of the Iron Mountain Railroad, didn't you distribute your expenditures to the different accounts?

A. Yes, sir.

Q. You knew what they were?

A. Yes, sir.

Q. You reported them?

A. Yes, but the Auditor's report to the General Manager did not reflect the report I made to the Superintendent of Machinery's office.

Q. How do you know that?

A. Because the General Manager in ninety days used to furnish us with a report.

Q. That service ended on the Iron Mountain in 1899 with you?

4935 A. Yes, sir.

Q. Do you know what the conditions have been since then?

A. No, sir.

Q. You take something that has become familiar now, more familiar to the public than a railroad locomotive—if you were to buy an automobile and run it until it was three-fourths worn out, what effect would that have upon the expenses or current maintenance?

A. It would depend largely on how much service I subjected it to.

Q. Suppose you subject it to just such service as would relatively obtain as compairing an engine in through freight service with an engine in local service?

A. Now an automobile is something I never owned and had anything to do with.

Q. I refer to that because an automobile is made up of machinery——

A. Yes, but the conditions under which it is operated is no comparison, simply because it never goes over the same road the second time, and is run over bumps and ditches largely——

Q. It runs over the same kind of bumps as it did when it was new?

A. Not necessarily.

Q. I imagine it does,—we will assume it does, because we know that an engine runs over the same bumps, if it runs on the same road?

A. No, I don't think the illustration or comparison is a
4936 fair one.

Q. Lay that comparison aside, do you think on reconsideration, it is fair to say that an old three-fourths worn out engine can be kept up at the same expense that a new engine, or an engine that is in use when it is in its better days——

A. I mean to say that a locomotive totally unfit for through freight service, on account of defects, leaky flues, treadworn tires, can be operated in local service just as cheaply as a good locomotive can in through freight service.

Q. And run at the same or higher rate of speed?

A. I don't understand that—I don't understand Col. Gray says that.

Q. Assume that it does?

A. I don't assume that.

Q. For the purpose of the question, assume that it does run at a higher rate of speed between stations, would you say that would contribute anything to the cost of repairing a locomotive?

A. It might contribute to the cost of repairing switches and rails on account of the worn condition of the tires.

Q. Is it not more damaging to the locomotive in running at a high rate of speed than at a low rate of speed?

A. Not necessarily, unless she is run at an excessive rate of speed and creates excessive friction.

Q. Does it require any more fuel to enable a locomotive to pull 32 loaded cars than it does 16?

A. I should think so.

4937 Q. How much more do you think it would require?

A. I would have to know the conditions under which the locomotive was operated—start two locomotives, one following the other and running a given mileage, one following the other, one with 30 cars and another with 16, the one with 16 cars would burn less fuel.

Q. Can you give me in a general way the percentage of difference?

A. No, sir.

Q. Do you believe that 3½ per cent would cover it?

A. I can't say because I never have had a case of that kind under my observation, and of course I would not attempt to state what the percentage of difference would be.

Q. You said the conditions on the Iron Mountain Railroad in Arkansas were about the same—the physical conditions—as the Cotton Belt; Do you know anything about the White River Branch of the Iron Mountain?

A. I did not mean to say that, I don't know that I testified as to the physical conditions of the other road.

Q. "If the tonnage handled or cars handled, were the same, I consider the conditions and contour of the country very similar; I would be willing to accept the test made on the Cotton Belt as a fair representation of what could be done on the Iron Mountain or vice versa."

A. That was operating conditions, not physical conditions.

Q. Wouldn't the physical conditions have some effect on it?
4938 A. I wasn't taking that into consideration.
Q. Take that into consideration now and say whether they would have any effect?
A. I say it is a fair test.
Q. Was your attention called to the fact that one of these tests was made in October, 1908, and the period to which it was sought to be applied was in another year—different year?
A. Yes, sir.
Mr. HILL: Corresponding month though Mr. Moore.

By Mr. MOORE:

Q. You said: "Unless conditions have been changed very materially, since I was in the service, the poor local does not receive the same attention as the through does."
Now you were in charge of that service when you were on the Iron Mountain Railroad were you not?
A. Yes, sir.
Q. Why did you neglect the local?
A. I didn't neglect anything intentionally.
Q. Why did you speak of it as "The poor local" not receiving the same attention—local engines are always in terminals at nights?
A. Our shops, as a rule, are not operated nights, we just run a Round House force, to do what you call running repairs. On through freight engines and passenger engines that are in there at night, they are given preferred attention, because a defect that would delay a through freight train—heavy through freight
4939 train or passenger train, would have to be given attention, that if the same defect existed on the local engines, they could be allowed to go for another trip without any necessary delay. All the employés in the round house are given to understand they must give the engines for immediate service, preferred attention—or used to be.
Q. This is Round house expense?
A. Yes, sir.
Q. And it is just simply to cover the attention that is given trains—engines in passing?
A. No, sir, running repairs—an engine comes in this evening we will say at seven o'clock, and they are due out to-morrow morning at 7:30, the shops are not in operation, and there are only those repairs that can be made—hand repairs.
Q. The shops are not required to do hand repairs?
A. They do a great many repairs in the day time that the work is done in the shop, except the application of it.
Q. These repairs that you speak of—conditions that you speak of, that is given to the engines in actual service while they are laying off between times, while they are not in the service—take the local, it comes in at night and goes out in the morning?
A. And the through freight and passengers—the through engines come and go in the same way.
Q. The local train doesn't run at night?

A. We never had any night locals when I was with them.

4940 Q. So the local would be in the Round House 12 hours, from seven in the evening until seven in the morning?

A. Those were not the conditions that prevailed when I was over here. Our locals were on the road a good many hours—leaving one time perhaps in the morning——

Q. I am not caring about the regulation as to the time they should run, but they would be there during the night?

A. Yes, the local schedule was about 12 hours.

Q. Take the through cars, did your through cars lie there that way?

A. Through freight engines came in any time during the 24 hours. When I was there, our through freight engines was in what we called "chain gang," that is, we had no regular crews for them, and when a through freight engine would come in, there was a train waiting for her, just as soon as we could get her out. Her work report was gone over, an inspector was put on the engine to make an inspection of it, of the driving boxes, brakes, and such things as were necessary, and any repairs that were necessary, all that was perceptible, that would contribute to the delay or liable to contribute to the delay of that engine, was done.

Q. Your chain-gang perhaps was there for the purpose of having a gang ready for that engine?

4941 A. No, sir, the chain-gang was necessary, because we did not have a sufficient number of engines to handle the business——

Q. You wanted to get it out as quick as you could, and therefore you did not detain it any longer than necessary to get it out of the Round House?

A. I said we made a close inspection and examined the engineer's work report, and our help was concentrated on that engine to get the work done—every thing done, every defect that was apparent, that was possible that would operate against that engine making a successful trip; while the same defects operating on an engine in local service would be allowed to go until she came back again.

Q. How long would you keep an engine in through service in the round house?

A. Just as soon as you could get them ready to go.

Q. The idea was to get them in and get them out as soon as you could?

A. As soon as you could make repairs.

Q. You wanted them for service as soon as you could get them?

A. I have seen eight trains waiting with only one engine in sight.

Q. In view of that condition with respect to the time that you could spare the engine pulling the through freight in through service as compared with the all night lay over of the engine in local service, notwithstanding you might have felt the impossi-

4942 bility of keeping your engine in through service up, didn't you have more time and more opportunity with your night

round house crew during the entire night to get the local train running?

A. No, sir, it wasn't many times the local engine ever came into the round house at all, we would just put her on the turn table and turn her around, so as not to obstruct the cinder pit and delay the through freight engines, and we would back her over on some dead track.

Q. What did that service consist of, wiping and cleaning her down, and things like that?

A. No, sir, there was very little wiping done. The service consisted of any repairs that was necessary, very often found from the inspection or the report of the engineer.

Q. What is the character of the injury to passenger coaches, express, mail and baggage cars, to which you refer, when you spoke about the expense of maintenance in connection with—you spoke about the order in which these cars were in the train, and about the expense and damage accruing, to what part of the cars is that expense applied?

A. The draft gear, underframing and trucks, and the exterior finish—roofs, damaged as the result of cinders, and the varnish.

Q. What is the most perishable part of the car or coach?

4943 Q. Of the exterior—outside of the interior?

A. I would consider the varnish.

Q. How about the platforms and vestibules?

A. Under recent construction, the platforms and vestibules——

Q. Take it as to the time you were in the service?

A. The modern cars built when I was in the service?

Q. Yes, sir.

A. Owing to the changed construction—steel platforms, very little expense was attached to maintaining passenger coaches—that part of them——

Q. What does the impact of stopping the trains tend to have upon the platforms and vestibules?

A. Well, stopping a train——

Q. That is very wearing on cars?

A. Yes, sir.

Q. And have no support?

A. Yes they are supported.

Q. Except by projecting appliances—what I mean is they have no foundation as the body of the car has?

A. The recent construction had, and built like the old ones, the intermediate sills in some cases ran through but with the passenger train—there is where the iron brakes comes in again—there is no reason why that the tension of the springs in the passenger trains, that the stopping of the trains should damage them, simply because when the brakes comes on one car, they come on them all. I think in the passenger train,—like a freight train, the greatest damage is done in *in* starting, since we have had the power brake——

4944 Q. Where is that done?

A. At the draft gearing and attachments, of course the severest stress is on the cars nearest the locomotive.

Q. Why is that?

A. Because they have to take the greatest strains, pulling the greater load.

Q. I don't understand just what you mean by that—suppose a baggage car, mail car or express car is loaded less heavily?

A. Yes, but they have to pull the coach, and it is loaded, and the passenger car has no connection with the locomotive only through the baggage car and mail car——

Q. There is *of* platform on those cars?

A. No, sir.

Q. Are the trucks or wheels, are they connected with the body of the car?

A. No, sir.

Q. Practically separate?

A. The car floats on it.

Q. You spoke of the damage to trucks and things like that, do the trucks really receive any strain in moving, don't they move, you might say, almost automatically with the body of the car?

A. In stopping the truck stops the car, and in starting, the car starts the truck, simply because the brake is attached to the track, and the draft power is attached to the body.

4945 Q. Why are the superior cars of the passenger cars—Pullman cars and parlor cars of these fast fine trains you find on the eastern roads, and all roads as far as that is concerned, put in front close to the engine?

A. I don't know.

Q. Isn't the only reason in order to avoid cinders?

A. I don't know.

Q. Isn't the deposit of cinders worse a few cars back than on those immediately up close to the engine?

A. They will keep rolling over the cars until they fall off, but they hit hardest up close to the engine.

Q. Haven't you known persons to go from the rear car up near the front in order to avoid cinders?

A. No, sir, I have never heard tell of such a suggestion before. The first time they hit, they cut the hardest, that is when they hit the hardest.

Q. The direction of the cinders depends upon the wind doesn't it?

A. No, sir, the smoke does to a large extent.

Q. Don't you know the cinders also go with the wind? What was it that burnt up all this cotton at New York a few years ago, except the wind blowing across the track?

A. To qualify my statement there, that depends upon the velocity of the locomotive.

Q. Wind too I reckon?

A. Yes.

4946 Q. So you may say it is about as uncertain as the wind?

A. A passenger engine running at an ordinary speed, the wind doesn't have much effect on the cinders.

Q. Don't know whether you ever have played golf or not, but if you ever have—my friend Judge Hill will testify on the point—if

you ever played golf you know when you strike your ball it goes up some considerable distance before it comes down; with me it will go about 50 feet, with Judge Hill, probably three or four hundred yards; doesn't it come out of the engine and do the same thing, when it comes out it comes with great force and rises and don't the greater part of them go further back than these cars immediately in front before they fall?

A. I never played golf, but you don't knock that golf ball and guide its force, and therefore, don't put as much force into it, the cinders out of a locomotive are discharged from a tube, and it really guides its force.

Q. Are the cinders not propelled from the smokestack with greater force, and upward?

A. Yes.

Q. How does the wear and tear on a passenger coach compare with the baggage and mail and express car, I mean the expense, considering the character of the operations, if they are to be kept up and maintained?

A. What would you be allowed to take in, in that wear and tear?

Q. Take in everything.

A. The entire car?

Q. Yes, sir.

4947 A. That is maintaining the car in service?

Q. Yes.

A. Not including the repairs when the car goes into the shop, that is just for maintenance?

Q. Yes, I mean to include everything.

A. Well, owing to the greater length, the greater amount of glass and lamps, etc., the coach, if a first class coach, for the same number of miles, covering a period of years, would cost more to maintain it than a baggage car, but there is really not very much difference excepting when you take in the difference of length and your inferior finish of the coach, and the baggage car being about 50 feet long and the coach about 75 feet.

Q. You state in your examination in chief, you made this statement, referring to cleaning and handling cars and service of that sort, I quote from your testimony at the bottom of page 56, you were asked if the cleaner was not like a pooh bah, and you said when you had nothing else you could charge the expense to, you could charge it to that, and employ a man to work in your office—you just hired a man and called him a car inspector, or a car cleaner and put him in the office to help out. Did you follow that practice while you were Master Mechanic on the Iron Mountain road?

4948 A. Yes, sir.

Q. You stated yesterday that you were discharged by the Iron Mountain road?

A. Yes, sir.

Q. Wasn't that one of the things that caused your discharge?

A. No, sir.

Q. Do you call that proper practice?

A. That is obeying instructions of your superior.

Q. Does any such practice as that exist on the Iron Mountain railroad today?

A. I don't know.

Q. Wasn't complaint made about that matter, among other things, at the time you were discharged?

A. In justice to myself, I think I am entitled to an explanation of why I was discharged, since you have brought the subject up.

I was discharged for obeying the instructions of my superior to transfer of money, both labor and material expended in building road devices—charge them to locomotive and cars without authority from the Auditor's office. Mr. Reardon gave me verbal instructions that all in excess of what the road work we were doing, would cost over what it would cost if done with a steam shovel was to be charged—distributed amongst locomotives and cars, which I done. When the monthly expenses came in for labor and material, in my own handwriting, I made a lead pencil distribution, a certain percentage to passenger engines, a certain percentage to freight
4949 engines and freight cars, the distribution clerk exposed it.

Mr. Dodridge was the inventor of the road device. I was building them at his request, and on orders from the Superintendent of Machinery. Mr. Warner wanted the work done with the steam shovel—reducing the grade line. Mr. Warner told me that I did that under instructions from Mr. Dodridge, and I told Mr. Warner I did not, and he discharged me, as he stated, for lying.

Q. Mr. Warner was the Auditor wasn't he.

A. Mr. Warner was the General Auditor and Vice President, I think.

Q. That was brought about as to whether you did it through instructions or whatever way you did it, because the Auditing Department wanted it distributed properly?

A. No, sir, the Auditing Department didn't approve of that and wanted every item of expense charged to the proper account.

Q. Where it properly belonged?

A. Yes, sir.

Q. And it was a question of disregarding that of which they complained?

A. Yes, sir.

Q. And you replied that you dis-regarded that because of the orders of your immediate superior?

A. I was instructed by my immediate superior, but Mr. Warner thought Mr. Dodridge instructed me to do it, but it was not.

I have letters right in the office, or did have, asking for
4950 increased clerical help, and I would get a letter from the Superintendent of Machinery's office, "Increase your number of car cleaners or inspectors."

I suppose they have reformed all over the Iron Mountain railroad today, and I don't suppose anything of that kind exists.

Redirect examination.

By Mr. SMITH:

Q. If I understood you correctly about the matter of your discharge that Mr. Moore brought up, they were after Mr. Dodridge, and thought he was the man that had given you those orders when he had not?

A. No, sir, Mr. Warner told me Mr. Dodridge gave me the orders.

Q. And you could not convince him that you did not get them from Mr. Dodridge?

A. No, sir, and I wouldn't tell him who did give them to me.

Q. You took as an illustration of another matter that you referred to in your testimony of padding of equipment accounts on the Illinois Central, as I understood your testimony on that, you regarded Mr. Harahan as being of the same high character as Mr. Carl Gray?

A. I looked upon Mr. Harahan as a man of as high up-right character as any man on earth.

Q. And you don't think Mr. Harahan would have permitted the padding of car accounts for a moment?

4951 A. No, sir.

Q. And you don't think Mr. Gray would?

A. No, sir.

Q. If Mr. Harahan received his car reports, including these padded reports, he would naturally form his opinion that these were the cost of maintaining that equipment?

A. Yes, sir.

Q. So if the General Manager of this road would receive your reports, if the Auditor had not checked them, he would have received the impression that this was the cost of maintenance?

A. Yes, sir.

Q. That is the way I understood your testimony, that the General Manager did not know the details of the cost of maintenance?

A. That is the information I wanted to convey.

Q. Mr. Moore had you to put in a beautiful picture here in the record of a triple valve, a very complicated and beautiful piece of machinery, according to this picture. I find on the opposite page in the book this was taken from, as the cost of this triple valve, as shown on the catalogue from which it is taken, to be $20.00. This beautiful piece of mechanism composed of 34 parts costs $20.00?

A. Yes, sir.

4952 Q. Now there was 122 parts of the air brake that you and Mr. Rosing agreed was correct, and I will not take up the details of them, but I want to call your attention to some of the parts that are shown in this beautiful picture. They run from one cent to $8.00, several of them are one cent, two cents, five cents, and so forth, is that a fair illustration of the cost of this air brake?

A. Yes, sir, the total cost of the freight car equipped was $30.00—isn't that right Mr. Rosing?

Mr. ROSING: The cost of the brake on the car is about $90.00.

WITNESS: It wasn't that years ago.

Mr. ROSING: To put on the brakes, you had to put on metal beams?

WITNESS: $40.00 a car is what we used to pay for it.

Mr. ROSING: Just the air brake part costs $40.00.

Mr. HILL:

Q. All these 122 parts cost you $40.00?

A. Yes, sir, that is why I made the reference to the switch rope.

Q. What was that switch rope?

A. That was the rope that was carried in the caboose for re-railing the cars,—a big manila rope 3½ inches in diameter, with a hook in one end.

And the same way with the car chains, a caboose that went out without four or five car chains, the conductor was discharged if he had to set a car out because he didn't have chains enough to
4953 keep it going, these car chains are made up of 75 links I guess. If you want to delude some person with these figures, might I consider this as reasonable to bring in the switch rope we used to use and the car chains that they don't have to use now.

Q. This is very serious here, some of these 122 parts actually cost one cent and others, quite a number of them—does this imposing array of one cent parts and two cent parts and $1.50 parts, all amounting to 122 parts, costing $40.00, after your attention is called to it, change your opinion in the least as to what you have heretofore expressed about the effect of this air brake as compared with the hand brake?

A. No, sir, I had all of these parts in view.

Q. You had all of these things in view when you gave your testimony?

A. Yes, sir.

Recross-examination.

By Mr. MOORE:

Q. How many cars were in freight service on the Iron Mountain road when you were Master Mechanic?

A. I can tell you tomorrow morning.

Q. Just tell it as near as you can.

A. I cannot tell you how many locomotives we had, but I have got all of that at home.

Q. There were thousands of them?

A. Yes, sir.

4954 Q. And one of these devices was on all of those cars?

A. All air cars—all were not equipped when I left the service.

Q. They probably are by this time?

A. Yes, sir, if they are in inter-state service they have to be.

Q. If there were from forty to fifty thousand cars, each one of them would have those devices?

A. Yes, sir.

Q. And although it might not amount to but little in detail, it would amount to a great deal in the aggregate?

A. Yes, sir, these safety appliances and power brakes were an enormous expense to the railroads.

Redirect examination.

By Mr. HILL:

Q. You mean it was an enormous expense to install them?

A. Yes, sir.

Q. But the up-keep is less?

A. Yes, sir, it makes all contributory damages as a result of the methods that those things remove, very materially reducing not only personal injuries but everything else as well.

Witness excused.

Adjournment 7:10 P. M.

4955 K. P. ALEXANDER, being duly sworn and examined, testified as follows:

Direct examination.

By Mr. HILL:

Q. I wish you would state your name, age, residence and present occupation?

A. K. P. Alexander, age 46, Division Sales Agent, McAlester Fuel Company.

Q. Your present residence is Little Rock?

A. Yes, sir.

Q. Mr. Alexander, you have had long and varied experience in railroad work, I wish you would give a little biography, for the benefit of the record in this case, of your services with railroad companies.

A. Do you want it as specific as Mr. Roberts gave you?

Q. If you can recall it all?

A. I have notes in my desk showing service in different capacities——

By Mr. MOORE: He can state it, and if I want to cross-examine him on it I can do it.

By Mr. HILL:

Q. Just speak generally without being specific as to dates.

A. I was a machinist about ten years, part of the time with the Missouri Pacific—machinist at St. Louis, Mo. Later I was with the Frisco as machinist and Division Foreman at Newberg, Mo., and at Fort Smith, Arkansas, about fifteen years.

4956 I was then Master Mechanic for the Fort Smith & Western Railroad Company in charge of all power and equipment, at Fort Smith, Arkansas,—office at Fort Smith, Arkansas, for the period of two years.

And in 1904, I went into the coal business, and since this time I have remained in the coal business.

Q. Your railroad service then terminated in 1904?

A. Yes, sir.

Q. I will state in this connection, that our case is made up as to the conditions of 1907 on railroads, and in asking questions, I may say now, in contrasting the former period with the present time, but I mean to say 1907.

You heard the questions as put to Mr. Roberts about starting and stopping and switching?

A. Yes, sir.

Q. I will repeat the question in shorter form. The State has used exhibits in this case showing tables prepared by Welling, an authority on railroad operation, in which he gives the distribution of the cost of freight car repairs as 21½% in starting and stopping, and 13½% in switching.

The railroad witnesses in rebuttal have recognized Welling as an authority on that question, but claim his tables were prepared while the link and pin couplers and hand brakes were used, and before the automatic couplers and air brakes, and that owing to the change in equipment, the percentage should be largely increased.

4957 Assume for the purpose of the question that the Wellington percentages were correct of his date,—and it is a fact that these percentages would compare with the statistics made up during the time the hand brake and link and pin coupler were in use,—assuming that is a correct percentage under that method of railroad operation, I would like to have your opinion as to what change, if any, should be made now?

A. 1907?

Q. Yes, sir.

A. From my observation and practical experience, I would say that the percentage should then be somewhat less, for the reason that all power and equipment was, during that time, and has previously been made much more substantial than it was during the time of the link and pin couplers, and during the time of the hand brake—all parts being strengthened to take care of the additional weights and additional lengths of trains and the heavier equipment, and I believe that the percentage would be possible one-half of the percentage of the link and pin percentage.

Q. You mean on both of these propositions, taking starting and stopping?—Assume 21½% under the old method, what percent would you give that under the new—in 1907?

A. I think 15% would have covered it.

Q. Well, on the switching, assuming that 13½% was correct under the old method?

4958 A. I should think it should be reduced possibly 20%, for the reason that the damage to switching now is not as great as it used to be.

Q. You would leave that at about ten in round figures?

A. Yes, for the difference in the rigging and the other appliances

that are used, the damage couldn't be as great now as under the old method of car construction and locomotive construction.

Q. Mr. Alexander, the State's accountants have used 2½ times for locomotives as against freight cars, in ascertaining the cost of maintenance of way on the per mile run basis—in other words, assuming that the engine in running forty miles would do as much damage as the freight car in running one hundred miles. I read here in your presence from the testimony by Mr. Gray in which that is attacked, I wish you would give your opinion upon that proposition, based upon experience and observation, as to the comparative injury to the way by locomotive contrasted to the freight car,—by that I mean taking the average conditions, year in and year out, season in and season out, big cars and little cars—I am trying to get at a general average condition?

A. Going into it I will have to go into it in a little detail, in order to make clear what my meaning is—The damage by a large furniture car would be greater than by locomotives,—the weight of the locomotives is upon a very much greater number of wheels distributed over a greater length of track surface than on any other car, having four wheels, or four wheel trucks, so that there
4959 is a greater amount of weight on the track under a heavily loaded furniture car than there is under the same length of track on any locomotive. Further, locomotives are always so constructed by the use of springs and equalizers and other devices as to nearly compensate for all the shocks or irregularities of the track, more than has been found profitable to use in constructing freight cars. It is true that not quite as much attention is paid to flat wheels on cars, which of course injure the track, same as a flat wheel on locomotives, the tires on locomotives, both the tread and on the flange, are watched by all Master Mechanics and engineers much more closely than it is possible to watch the tires and tread of wheels under cars. It is true that in the early days, not as much attention was given to the correct counter-balancing of locomotive driving wheels as was done in 1907.

Q. Mr. Alexander, I wish you would explain that in detail, some of the other witnesses have explained it, but as far as I have been able to gather, I have not quite understood it, I wish you would explain that from a technical standpoint?

A. So that the layman would understand it is what you desire?

Q. We have to try this case before Judges who know more about it than we do, but still we would like for you to explain it so the laymen would understand it, as far as we are concerned.
4960 A. In locomotive construction, there is what is known as the angularity of the main rod, which is considerable greater in short main rods than in long rods, and on account of the main in short main rods than in long main rods, and on account of the main rods and the side rods, certain counter balancing must be done to the driver wheels—the locomotive driving wheels.

The counter-balancing of the locomotive driving wheels was not very scientifically done until within the past six or eight years, but since then, by numerous experiments that have been made, the in-

correct systems of balancing have been almost wholly over-come. The effect of the incorrect balancing was—when the locomotives ran at a high rate of speed, it caused them to pound on the rail at each revolution which injured the track.

That pounding of course, was never true with reference to car wheels, and all locomotives are now supposed to be so constructed that this pounding effect no longer exists.

Q. Was that the condition in 1907,—you say now?

A. When I say now, I mean 1907 in all my testimony.

Q. Now I probably broke into your *tread* of reasons—I wish you would state further——

A. I would state further with reference to the pounding effect, what used to be true with reference to locomotives, that effect wasn't so great from local freight engines as from through freight engines, for the reason that the local engines, as a rule, run at a lower rate of speed than the through freights or fast freights, therefore the
4961 local engines would produce less damage to the track from improper counter-balancing, flat wheels, etc., than the through freight engines.

Q. Now taking it as a general proposition, applying the extremes on each side, taking an ordinary locomotive and an ordinary car, equalize the extremes, I wish you would give your best estimate of the proportional damage per mile, regarding the locomotive as one unit*e* and the car as the other unit*e?*

A. Basing the estimate upon the average of both?

Q. Yes, sir. Now in freight service I am speaking of.

A. Now in freight service, the only estimate I could give would be simply my judgment from observation.

Q. That is all we can ask you.

A. And merely as a guess, and from my observation, I should imagine that the 2½—that is it isn't it——

Q. Yes, 2½ times has been allowed, assuming the engine would run 40 miles and the freight car running 100 miles.

A. I would say two to one would be nearer fair.

Q. There is one other question, going back to the starting and stopping proposition. Mr. Alexander, are you familiar at all with the Union Pacific Railroad?

A. No, sir.

Q. Are you familiar with the transition taking place in 1904—from the old line of equipment to the new—I understood that was the transition period, along in there is when it occurred wasn't
4962 it?

A. Yes, sir, there were a great many changes made along then and since that time, as well as previous to that time.

Q. Are you familiar with the order of these changes—the safety appliance that has been added, the automatic couplers and so on, since 1904 up to 1907?

A. It is my recollection that all the equipment had automatic couplers by 1907.

Q. Mr. Alexander, assuming that cars were not equipped completely with automatic couplers and various other safety devices pre-

scribed by the Act of Congress, in 1904, but that the equipment was completed by 1907. I will ask you what would be the effect on the car damaged, say there was a table made up in 1904, the figures running back for three or four years prior to that time, would the percentage allowed in such a table still obtain in 1907?

A. On what class did you refer?

Q. I am referring to these starting and stopping, and the terminal handling and switching? The percentage of repairs or maintenance of repairs due to starting and stopping,—maintenance for equipment in starting and stopping—this table was probably made up in 1904 based upon experiments made for three or four years prior thereto, and a certain percentage given—say 16% for switching and 20% to starting and stopping, or, any other per cent—I want to get
4963 at a comparison, I say for the year 1904 would be this per cent, now for the same item in 1907 what would it be?

A. The percentage should be less, materially less than for 1904. I state that for the reason that all parts of cars that experience had shown to be weak, have been strengthened.

Q. Taking experiments based on three or four years prior to 1904, you would know there would be link and pin cars and hand brakes in the test made during these years?

A. There would be, almost exclusively so.

Q. Now Mr. Alexander, speaking from the shop standpoint and the repair standpoint of locomotives, taking the miles run, what locomotive has the most repairs, that hauling local freight or that hauling through freight?

A. In order to answer that question, it is necessary to explain, that as a rule on all, I think likely on all railroads, the best class of engines, and engines in the best repair are put on what is called the preferred runs,—or the through freight service, and after they have made considerable mileage, and they are a little bit run down in repairs, they are frequently put in local service, where they could get practically as good service as they would get from a newly overhauled engine, for after they have had a year or more service in through freight service, then the repair bill per mile run
4964 would be increased. So for that reason, it is not at all unlikely that the repair cost per mile run for local service would on that account show higher than the repair cost per mile run for engines in through freight service.

Q. That would be due, if I understand you, from the fact that it had deteriorated in through freight service and was dumped off on the local service?

A. Yes, sir.

Q. And for that reason much of this repair—the cost of the repairs should be attributed to its work in through service, and not take it as repairs done while in local service?

A. Yes, sir.

Q. Now here is another question right along that line, that is as to the engine house service. The State has assumed that the through freight locomotive gets no more Round House service per trip to the Round House, than the local freight locomotive. What is your

understanding—they have made allowances for extra trips—what I mean is the service per trip, wiping, knocking fires, and various other things the engines receive when they go into the round house?

A. Engines in local freight service invariably come in in the evenings and leave early—at seven o'clock the next morning, and the only repairs they get are of the emergency character,—repairs that must be made in order for the engine to make a successful
4965 trip to the other terminal, they are usually not wiped up, they get some attention, as far as the boiler wiping is concerned, they hardly ever give that, the hostler inspects the coal, and water and sand, looks after that, and it is possible that such machinist work as may be necessary to be done, and in that it may cost slightly more for the reason it is done at nights, that would be true only in such round houses as did not have regular men who would be paid the same rate for night work as the day men were paid for day work, so I doubt if there would be any additional expense per trip to a local engine then to the through freight engine, and I believe the expense per trip would be less, at least, that has been my observation.

Q. At any rate, you don't regard it as any injustice to put it on equality with the through traffic?

A. No, sir. And as before stated, the local engines having been partially worn out in through freight service and probably on that account they *were* probably require greater expense than the through engines would.

Q. That is getting into another account,—these accounts are made up according to the Inter-state Commerce Commission classification, and each account stands to itself. I understand this engine house is a stable you put your engine in. These other repairs come under the head we discussed awhile ago.

Now on the passenger side of the proposition, the situation in this case calls for the separation upon some base of the mail and
4966 express expense from that of the passenger, and after that is separated from the passenger business, then to ascertain the expense to be properly apportioned to State and inter-state passenger service, and in this case the car mile basis has been used, which, of course would be on the various equipment, on the mail, express and coaches, exclusive of the Pullman, that is taken care of by the Pullman Company, in another account.

They have been criticized on the ground they have done injustice to the mail and express in treating it on an equality—the expense as to the car mileage. I wish you would give your opinion as to the cost of repairs of the various kinds of equipment, mail cars, express cars, baggage cars and coaches, and then give us your opinion as to the apportion that should be made—taking the express and mail on one side and the coach and baggage on the other.

A. What expense do you want to figure in this?

Q. Car repairs.

A. Not painting and varnishing?

Q. I presume that is repairs under the classification that should be included.

A. Everything that is done to the car in the shop—now I

would state that is all pooled on the Iron Mountain and Missouri Pacific System——

Q. Now not taking the figures derived from the pool, but upon car mileage basis, per mile run, separating the express and
4967 mail from the coach and baggage, what is your opinion on that, that is what I am asking.

A. Covering the matter, what we generally call car repairs, I should think the greatest expense would be on the car nearest the locomotive, on account of it having to absorb the shock of all the loads or cars behind it, which would mean that there would be less damage to the coaches than there would be on the baggage cars or mail cars. Very little cleaning at terminals is done to the mail car, express car and baggage car——

Q. Cleaning, Mr. Alexander, goes in another account, that is not the car repairs, that goes into the transportation account, that doesn't go into the car repair account, so you can exclude that from your consideration.

A. Then you want just the car repairs, everything pertaining to repairs?

Q. Yes, sir.

A. I have no figures, never kept*ed* any figures on that point, and from my experience, I doubt if it is usually done, and I would hardly know how to estimate it.

Q. Which goes into the shop more often, the car next the engine or the coach?

A. The car nearest the engine, it would go into the shop oftener, for the reason it would receive all the shock of the entire train, and the gases of the coal burning in the engine, and the cinders,
4968 would damage the roof more quickly than it would do further back in the train, but I presume there would be some compensating elements on the other side, about painting, varnishing, putting in glass, and so on, in the coach.

Q. Taking it by large and by small—the general average condition, what would you say, what would you say as to the division of the car repairs, the mail and express on one side and the coach and baggage on the other—the damage to the baggage and coach as against the mail and express, what would you say as to the repairs?

A. Well the coaches are very much longer than the baggage or express cars, and the mail cars are usually also longer, which would require more painting and more varnish than for the shorter cars—the question is a little bit ambiguous.

Q. I will make myself clearer, the question is to separate and get the mail and express expense out of the passenger expense, and they have used the car mile basis and apportioned that expense, taking the mail and express on the one side and the baggage and coach and everything in passenger traffic from the other side—I understand your testimony is, the greatest injury to the cars would be to those toward the front—that is to starting and stopping and to paint and varnish?

A. Yes, sir.

4969 Q. On the other hand there would probably be more injury to the interior of the coach, the glass, upholstering, of the coach and things of that kind?

A. I think so.

Q. The question is this, treating them alike, has any injustice been done to either traffic,—treating them alinke on the car mile run?

A. I haven't ever kept any data on that, it is a very difficult question to answer, but then from my observation, I should imagine that it would be about fair.

Q. The coach would likely get more repairs, but wouldn't get into the shop as often? That would probably be about the situation?

A. Yes, sir.

4970 K. P. ALEXANDER, re-called for cross-examination, testified as follows:

By Mr. MOORE:

Q. Mr. Alexander, when were you in the machine shops of the Missouri-Pacific at St. Louis?

A. About 1881 or 1882.

Q. How long were you there?

A. About a year.

Q. What capacity were you working in then?

A. Machinist.

Q. What department were you working in?

A. Machinery shop—back shop.

Q. How old were you at that time Mr. Alexander?

A. I was born in 1865—about sixteen, somewhere about that.

Q. You were learning, in other words?

A. Yes, sir, I was just a young fellow.

Q. Then after that you went with the Frisco—some years after that as machinist and Division Foreman at Newberg—where is Newberg?

A. That is the first division point southwest of St. Louis on the Frisco.

Q. How long were you there?

A. About twelve years.

Q. When were you Master Mechanic on the Fort Smith & Western?

A. Do you want the years?

4971 Q. Just about—as near as you can recall, I don't care about being exact as to the year—as near as you can recall?

A. About 1902 and 1903, I think.

Q. Where is the Fort Smith & Western? Where does it run?

A. It runs from Fort Smith, Arkansas, and at that time to Guthrie, Oklahoma.

Q. How long had that road been in operation then, Mr. Alexander?

A. Since about 1902 or 1901.

Q. Did it have a large equipment when you went there?
A. Not when I first began, but when I left there it had about 14 locomotives and 1200 cars, possibly more cars than that.
Q. It was still in its modest state then?
A. I equipped the Mechanical Department there.
Q. You quit there in 1904?
A. Yes, sir.
Q. Did you quit railroad service then?
A. Yes, sir.
Q. What is the weight and capacity of a large furniture car?
A. A great many of them are 80,000 capacity, and some a hundred thousand capacity, just what their weight is I don't remember.
Q. It requires a pretty large car to carry one hundred thousand pounds of furniture?

4972 A. All cars are built to carry ten per cent over their stenciled capacity.

Q. You spoke yesterday about a furniture car, I suppose you mean it was of the class of cars constructed for the purpose of carrying furniture—furniture cars are usually longer—Mr. Roberts who testified in this case yesterday, said that 60,000 was about the maximum capacity, and weight 40,000.——
A. I am not prepared to say what the weight of a car is or was, I have not retained that in my recollection—but the capacity on furniture cars run up from 80,000 to 100,000 pounds, for instance, coal cars as now built carry 80,000 to 100,000 pounds capacity.
Q. I understand that coal cars are now built to carry 80,000 to 100,000, but it would require a very much larger car to transport 100,000 pounds of furniture than it would 100,000 pounds of coal?
A. Yes, sir.
Q. Aren't you mistaken in the statement if you intended to make that statement, that furniture cars have a capacity in carrying furniture of from 80,000 to 100,000 pounds?
A. Yes, sir, it is possible I am, because for the fact furniture is lighter lading.
Q. What is the weight of the heavy engines that are now in use?

4973 A. I am not prepared to give the weights on the engines, I have not kept these things in mind.

Q. You wouldn't be prepared to make a comparison?
A. I will state this, during the past six years I have been entirely out of the mechanical business. I have been trying to forget it as much as possible in order to concentrate myself more on my present business, and I am not as well prepared to give detail information on weights and dimensions and things of that character as Mr. Roberts, for during the time he has been out of railroad business, has been doing semi-mechanical work, as he has had the supervision of engines and boilers on steamboats——
Q. So you don't feel as competent to take up these matters as Mr. Roberts?
A. No, sir, not as far as weights and dimensions etc. are concerned.

Q. I use the word "now," I suppose you understand I mean 1907?

A. Yes, sir, I understand that in all cases you mean 1907.

Q. You are not familiar then with the changes in appliances used in operating railroad cars that have been made since 1904 to 1907?

A. Well, as a matter of fact, I think there were very few changes made in 1904 to 1907 that I have not observed. I will say further on that question, there has been some changes in the air brake apparatus that have been made since 1904 that I would not
4974 be thoroughly acquainted with now.

Redirect examination.

*Agreement.*

Q. It is shown here by the witness from the Interstate Commerce Reports for the year ending June 30, y904, that over 90% of the equipment had been supplied with air brakes and automatic couplers.

By Mr. HILL:

Q. Mr. Alexander, on this furniture car that Mr. Moore cross-examined you about, wasn't what is called a furniture car—a car that is constructed to hold furniture but also constructed to hold any other commodity?

A. Yes, sir.

Q. And would have a capacity much larger for other commodities than it would have for furniture, isn't that a fact?

A. I think that is correct.

Q. Suppose you take a furniture car and load it with pig iron, it would have a carrying capacity for pig iron very much
4975 more than it would have for furniture?

A. Greater in pounds.

Q. That is what I mean. Do you have any recollection of the capacities by the Western Classification of the various commodities, or did that come in your line?

A. No, I have no recollection of the weights of the different class of cars, I can get it—I have it in my office.

Q. Do you remember about what a furniture car was—I understand it is about 14,000?

A. I don't remember.

Recross-examination.

By Mr. MOORE:

Q. A car built for carrying furniture, used for carrying furniture—different character of freight, is it used for carrying pig iron, rock and coal and things of that kind?

A. I think there are usually stenciled instructions on the side of the furniture cars prohibiting their use for certain purposes. I am also of the opinion, that in some instances they are stenciled to the effect that they are to be used for furniture only.

Witness excused.

4976 J. A. SIMMONS, being first duly sworn and examined, testified as follows:

Direct examination.

By Mr. HILL:

Q. Please state your name, age, residence and present occupation?

A. Age 55, Ft. Smith, Ark., sand business.

Q. You have had a great many years of railroad experience, I wish you would give a little biography of your railroad experience, commencing at the beginning without going into great detail, and give generally the different service that you have performed in railroad work?

A. I commenced on the Missouri Pacific the 1st day of October, 1896, as track layer at Selina, Kansas; I wasn't there but a short time, and went back to Texas and then came back, and went to work as section foreman at Gipsum City, Kansas.

From there, I was transferred to Ft. Scott, Kansas, as section and yard foreman. From there, I was transferred to Joplin, Webb City, Carthage, laying track for the mines.

4977 From there, I was transferred to St. Louis, overhauling the yards, putting in new yards from Cabanne Avenue to 700 feet east of Ewing Avenue.

From there, I was transferred to the Arkansas Division, headquarters at Walnut Ridge, as assistant Roadmaster; remained there four years.

The 1st day of July, 1898, I was transferred to Van Buren as Division Roadmaster of the K. & A. V. Division—had it for a time from Little Rock to Coffeyville, a short time; remained there 8 years, was transferred from there the 1st day of July, 1906, to Ferriday, Louisiana, as Division Engineer. Had charge of seven divisions down there.

Q. That on the Iron Mountain in Louisiana?

A. Yes, sir, remained there a year and quit railroading, the 16th day of June, 1907.

Q. The period that we are inquiring about in this case is conditions in 1907; that was the time you quit railroading?

A. Yes, sir.

Q. Have you, in your experience, observation, studied the relative wear on the track and roadbed, made by locomotives and by freight cars?

A. Yes, sir.

Q. Has your duties in the lines you have above described made it necessary for you to study those conditions?

4978 A. Yes, sir, that was part of my business.

Q. I wish you would state your opinion, based upon your experience, and observation, as to the relative wear on the road, take the whole way, by freight cars and locomotives?

A. Well, I think that a hundred thousand capacity coal car, loaded to its limit, is harder on the track than an ordinary locomotive; for the simple fact that the car hasn't but two bearings, two trucks, and they get the full force of that car on the track at

one end of the car—for instance, a low joint, that car will go into a low joint more severe than an engine will. An engine has a pin through the pilot trucks that lets the engine work up and down, and it doesn't put the full weight of the engine on the track, in any one place.

Q. How about bridges?

A. On the bridges, I think that the cars are more severe on a bridge; I don't mean to say on a bridge but against a bridge; there is but few bridges but what is higher than the track approaching it; letting the cars and engine hit against the bridge, as well as on it, and my opinion is that the cars hit a more severe blow to the track or a bridge, than an engine does.

Q. How about the frogs?

A. Well, frogs in my estimation, is the week spot on
4979 track; they are short as a rule, some only four feet long, and some of them 16 to 20 feet long, and there is four connections to that frog instead of two, to the track, giving it a chance to vibrate more or less than a rail.

Q. What is the effect of a very large locomotive and very large freight car on the frogs?

A. Well, you take a locomotive with a worn driver, and they soon wear out the wing of a frog, as well as the point: those worn tires are more on switching engines than they are on road engines. They use sand on switch engines more than they do on road engines, because they are not connected up with air; switching the cars away from them all the time, and the frog has to be renewed very frequently. Very frequently we make a new wing and put on the frog points; that could be done with what we call a jim crow or rail bender, and the drill; a good foreman can make a wing of a frog and put it on—I have put them on myself.

Q. What is the effect of the average car on a frog?

A. Well, the car, I think it would come pretty near in line with a frog as it does with a bridge; it would have more effect on the frog, after the frog is worn some, than an engine does, because it is going down in there with a chug of the wheel.

4980 Q. Where do you find flat wheels oftenest. I don't mean the number of cars, but relatively, one car and one engine?

A. Yes, we very frequently find a flat wheel on a car and on an engine too.

Q. Proportionately, which do you find the flat wheel in the oftenest; the car wheel or the engine?

A. I believe I have observed the cars the most.

Q. What is the effect of a flat wheel on the track?

A. It is very detrimental on the track, on account of its pounding; it comes around and strikes the rail similar to a trip hammer; that flat base hitting the rail injures the rail, and of course, to a certain extent, injures the car.

Q. What would be the effect of a flat wheel on a low joint?

A. Very detrimental, if it should happen to hit there; if a flat base should hit a low joint, it would be very detrimental; otherwise, it would be the same as any other wheel.

Q. Now, there frequently happens, as I understand, in the loading of cars, brings down the side bearings—what effect does that have on the track? What I mean, it brings the car down on the side bearings?

A. I understand what you mean; a car that is not properly loaded, the car being more loaded in one end, for instance,
4981 than in the other, or is overloaded, weights the car down on the side bearings, and makes that car—especially going around a curve, hug the outside rail more so than it would if it was loaded properly, and is detrimental to the track, and where there is bad ties it—I have known of instances where it would turn the rail over. I don't mean to say, turn it entirely over, but turn it out on the outside rail, sufficient to let the wheel on the opposite side of the car drop on the inside of the inside rail. When it would drop down there, then the wheel on the outside rail would pass over the top, and cause a derailment; I have known that to happen frequently, especially in yards.

Q. You commenced in giving your biography of your service, with the Missouri-Pacific and Iron Mountain in 1886?

A. Yes, sir.

Q. Prior to that time had you had railroad experience in what line—without going into the detail; state generally what kind of service you had with any other railroads?

A. When I was quite a lad, I had service as a watchman on the Mattoon & Gravial, building that railroad, and then I was on the Santa Fe.

Q. In what capacity?

4982 A. I was on the Sante Fe under L. W. Lewis and Barney Langtrey, contractors, in the construction department; I had a gang sinking pits for abuttments for bridges; from that, I went into the water service on the Sante Fe; I was in the water service, I believe, about five years, from Kansas City to Dodge City Kansas. I had a gang there, I think I was there about 4 or 5 years; I don't remember just exactly.

Q. What other service; I just want to get your experience without going into the details of it, up to the time you went with the Iron Mountain and Missouri Pacific?

A. That was about all.

Q. Are you familiar with the operations of trains in the olden times, we might call it now, when they used hand brakes and link and pin couplers?

A. Yes, sir.

Q. Are you familiar with the operations of trains with the automatic brakes and air?

A. Yes, sir.

Q. Equipment that has been installed in them in recent years?

A. Yes, sir. Understand me though—I am not a practical man at handling that air, but I have been with the trains and train crews for twelve years continuous—for 13 years continuous.

Q. And your work as roadmaster and in various other
4983 capacities, you have practically lived on the trains and with the trains?

A. I was on the road continuously.

Q. Are you familiar with the injury that is caused to cars by starting and stopping?

A. Well, I have seen a great deal of it.

Q. Are you familiar with the injuries that are caused to cars by switching?

A. Yes, sir, saw a great deal of damage done.

Q. We have a question in this case, that I will state to you. We have prepared exhibits using a percentage that was obtained in the days of the link and pin coupler and the hand brakes, the percentage was 20½% for damage done to freight cars from stopping and starting; that is from all damage done to freight cars, that it costs the road to maintain them—20½ per cent was added to that cost, to cover stopping and starting.

A. That is the old link and pin——

Q. That old table was made up in that link and pin day, and hand brake day, 30 years ago, something like that; the question I want your opinion upon, assume that that 20½% was correct—assume that it would be a correct percentage of those days, I will ask you the effect of the change to the modern equipment, whether it would be more or less injury to the cars, from starting and
4984 stopping under the modern equipment than under the old?

A. My judgment is that if it was 20% or 21% with the old hand brake, 9 or 10% would catch it now.

Q. You would cut it in two and a little more?

A. Yes, sir.

Q. What are your reasons for that?

A. Well, take the old link and pin, take the different size cars, let a high car come back against a low car, it would go on top or in other words, the link, if it was in the standing car, would go under the draw bar, of the high car, and have a tendency to raise that draw bar up; that would be injurious to the dead wood, and vice versa, it would be injurious to the draft timbers.

Q. How about the effect of the air applied through the train, as compared with the force set by hand brakes, what effect would that have on the stopping?

A. Well, the train set by air is stopped more uniformly than it is by link and pin; a link and pin, the brakeman got out and set three or four cars—four or five, such matter, and the engine does the rest of the stopping, of course that would have a certain tendency of jamming the cars together.

Q. You said the link and pin, I think you mean the hand brake, in referring to stopping?

A. No, sir, just explaining on the link and pin, they would
4985 set four or five cars with the brake; the engine would do the rest; that would be detrimental to a certain extent, with the car.

Q. In your work as roadmaster, have you discovered the effect of the injury to cars, as evidenced by scraps on your road, as a result of the stopping and starting movement?

A. Yes, sir, it was part of the roadmaster's business to help repair cars; that is, have the foreman help repair them; they would send a man out from headquarters to put in a draw bar, repair a car that was off the center, it would be our duty to assist that car repairer to that extent, and when I took charge of the K. & A. V., the 1st of July, 1898, they were just gathering up the scrap for that month or had just gathered it up; Mr. McCloud, the man I succeeded and I remember very distinctly, he had two cars and Mr. McKey, the superintendent, told me——

Q. Don't repeat what he said; that wouldn't be competent.

A. I had to separate that scrap, take the car scrap and put it in one car, and the track scrap and put it in another, and it was forwarded then to the purchasing agent at St. Louis, and when I went to handling that myself, I sent out two cars, one for the car scrap and one for the track scrap, saving the trouble of transferring it and assorting it, and very frequently, we would get two and
4986 sometimes more cars of scrap on the 166 miles of track. We later on had the section foreman to bring the draw bars especially from the cars that were set out, would be taken in chained up—we had the section foreman to take the draw bars to the depot and the agent would bill those draw bars to the master mechanic at our headquarters at Van Buren, to be used again in the cars.

After we got the standard coupler and air, I don't suppose that there is a full car in three months on the division.

The section foreman takes that to the tool house, and we have a little landing made to throw that on, and the local stops and they throw that on and bring it to headquarters.

Q. Now, take the switching side of that proposition, you testified you were familiar with the injury to cars occasioned by switching; it is assumed in this case that 13½% per cent of all the injuries due to freight cars in the old link and pin, hand brake days, would be due to the use of cars in switching; assume that that is a true percentage, of those days, what should be the percentage now; I don't care so much about the percentage as a comparison—would it be more or less with the modern equipment?

A. It would be less.

4987 Q. In your judgment, how much less?

A. You say that is 13%?

Q. 13½% was the old percentage, I think.

A. I don't think it would go over 5 or 6%.

Q. It is in testimony here by some general managers, that it is and feasible or practicable to make any estimate or intelligible estimate or fairly accurate estimate of the switching that is done by a local on the run; I wish you would state whether in your opinion, any one thoroughly familiar with the run of a local freight train could make a fairly accurate estimate of the number of miles that that local freight engine would switch in its run—I don't mean in any one day, or two days, but general average conditions?

A. I don't see how they could get at it accurately, but I believe it could be shown up approximately what extra running they would do at each station, provided they stopped daily at each station.

Q. Illustrate that, state how you would get at it—take any division that you are familiar with—state your method of getting a fairly accurate approximation of the amount of switching that would usually be done by a local locomotive?

I hand you a work sheet of Mr. Wright that has been used in this case, that gives the various divisions, and I hand you the sheet that shows the Central Division, Van Buren to Russellville, that I know you are familiar.

4988 A. Now take Shibley, and start with Shibley; that has a 3,500 foot passing track, and from that passing track is a spur, a fruit spur; that business is all done, virtually all done by the train going to Van Buren, taking the load there. I presume that it is 2,500 feet from the head block of the spur to the north end of the passing track; they stop their train at the south end of the passing track, or pull their train in on the passing track, then pick up their car off of the spur, put it into their train, and pass out of the north end of the passing track.

Q. In making that movement, how much mileage would they make at that place?

A. They would not make over a thousand feet at this point.

Q. Take another point there to illustrate your idea, about how you would get at the switching?

A. Let's take Mulberry—Mulberry has a long passing track; invariably, the train south bound does the work at Mulberry; they have a house track takes off from that passing track, as well as a spur; they pull down to the station and cut their cars that they have to set out, and do their switching there; it is probably 2,000 feet from the head block of the spur to the end of the spur.

Q. What would be the mileage of the switching made in handling a car there?

A. If you had to put a car in there, and take one out, it would just simply double that length; that would be—provided he

4989 went to the end of the spur, they usually don't go to the end, I don't think it is 2,000 feet, but we will let it go at that; while I laid the track, I don't remember just exactly what it is.

Q. Say that would be 2,000 feet, then the maximum switching he could get, would be that run you have made, and it might be very much less than that because he might not have to run to the end of the track?

A. That would be my opinion about it; I know that is the way they handle it. Now, we will go down to Ozark, and the passing track is on one side of the depot and the house track is on the other side—opposite side. I should judge that the house track is 1,200 feet long——

Q. And how long is the passing track?

A. 3,500 feet; but they don't use the passing track there for switching purposes; now, if he had ten cars in his train, he would stop the caboose at the depot to go back on the house track; he would probably do a thousand feet of running there to get the cars; if he wanted to take a car out and put one in, of course, he would do twice that.

2173

Q. Suppose that at Ozark, taking the illustration—it is a pretty good sized town, how many cars have they marked there that would usually be set out?

A. 2.

Q. Take some place that has more than that, some that
4990 would average three.

A. Cabin Creek has three and Clarksville three.

Q. Take either of those; would the switching movement, the ordinary running of the train, require the three separate switching movements for three cars?

A. No, sir.

Q. How would that be made?

A. If he has three cars to spot in there, he would take hold of the three cars and go in and spot the farthest car from his engine first, pull a hundred feet, spot the next one, pull up 100 feet or whatever distance it might be and spot the next one.

Q. If you would take the mileage made by each of those cars, say three, and calculate it as if you were calculating it as 3 movements to switch one car at a station like Shibley, that would give a great deal more mileage than the engine would really do?

A. Yes, sir.

Q. And in the practice, it is done as you stated, and there would not be that mileage earned for three cars, of three times what it would be to put one car in?

A. No, they put three cars out with the same length of run as they would one.

Q. What is the longest track at a station?

A. I don't know.

Q. Take——

A. Main line stations?

4991 Q. I am not asking you the number of feet of the various tracks there, the passing track, house track and industrial track, but what is the longest track that is used at a station,—I am not asking you in feet,—what kind of tracks do the usual stations have—take Mulberry, how many tracks has it?

A. 3?

Q. What are they?

A. Passing track, spur and house track.

Q. Which is the longest of those three?

A. The passing track invariably, if that is what you want to know.

Q. That is what I wanted to know, what is the longest track at a station?

A. I thought you meant the longest track.

Q. I meant the general proposition,—what is the longest track?

A. The passing track.

Q. If you figured every car that has been switched at a station, as switched the length of the passing track then you would get an excess of switching mileage over the actual facts; in other words, if you were making a calculation as we have called for here, for a car that was set out on the house track at Mulberry, if you figured the run on the passing track, taking the length of the passing track to figure

your mileage, you would have an excess of what the locomo-
4992 tive actually did?

A. Yes, sir, for instance, they run by the south end of the passing track, and go up two-thirds of the way *of* the *on the* passing track, and do the work and go on through, they wouldn't have gone but about one-third of the switching of that passing track.

Q. Is that the general relation of the tracks,—the passing track is much longer than the others.

A. Yes, sir.

Q. That is at all places the maximum track at a station?

A. Yes, sir, the standard passing track, from here to Coffeyville,—if I remember right, is 3500 feet; I extended every track from Van Buren to Coffeyville and made them standard.

Q. Well, as I understand your criticism of that system there (in the working sheets) it is producing too much mileage made in switching?

A. Yes, sir; you see Cabin Creek, for instance, he is setting out three cars and he goes six trips for them.

Q. And how many should he make?

A. One.

Q. Then he has taken the passing track mileage there too?

A. Yes, sir. Oftentimes it is like this: the local train will go on a passing track, and the engine will go past the head block of the house track; instead of that engine running ahead a thousand feet
or such a matter to go in on the house track, they cut off two
4993 or three cars back here to clear and hold onto them, and back those cars in and do their work and all they do is simply go the distance from the length of the head block back to the cars.

Q. That would be much less than the length of the passing track?

A. Yes, sir.

Q. Without pursuing that in detail, you could take—by "you" I mean someone thoroughly familiar with the road—a freight conductor or a man that knows the line thoroughly, and the usual conditions on the line of a local freight, and he could make a fairly accurate estimate of the amount of switching *down* by the local couldn't he?

A. Yes, sir, pretty close; I could go on a local train from here to Van Buren, Poplar Bluff or Hoxie, and get it accurately within a very few feet, by being with the train.

Cross-examination.

By Mr. MOORE:

Q. The amount of switching on different trips, different runs of an engine, are not at all uniform?

A. No, sir.

Q. The conditions vary from day to day?

A. Yes, sir.

4994 Q. Depending upon the conditions of traffic each day?

A. Yes, sir.

Q. That is the traffic that is carried in the local train?

A. Yes sir, it is not alike every day.

Q. And the character of switching necessary to be done in order to take out cars or spot the cars, depends upon the necessities of the occasion, on each performance in that respect, doesn't it?

A. Yes, sir, the agent, whenever a man comes into the station, the agent has a list for him to do, set out cars or pick them up.

Q. You illustrated awhile ago, about spotting three cars; suppose he wanted to take one out; that would produce an entirely different movement?

A. Make that trip in there would be all.

Q. I understand what you mean by spotting a car is pulling it to a certain location?

A. Yes, sir.

Q. You have three cars——

A. Yes, sir.

Q. You want to spot two cars and take an empty out?

A. Yes, sir.

Q. Now, the location of that empty may be such that it will require a different movement and more movements than it would to spot two or three cars.

A. The way that is handled is this; in most cases, not all,
4995 they go in on the passing track,—you say the spur takes off the passing track, and they go in to put an empty in there and take out two loads?

Q. Yes.

A. They will set the empty out on the passing track, and they will reach in and get those two loads, and come out, and reach down here and get the empty——

Q. In order to make that movement, they put the empty on the passing track?

A. Yes, sir, that is, just below the clearance post.

Q. At any rate, they take it to the point where it is left on the passing track and leave it there?

A. Yes, sir.

Q. And then they go on the spur track and get the empty?

A. Yes, sir.

Q. In the movement you have just described, of putting an empty, leaving an empty on the passing track and taking out two loaded cars, you make a movement first—the first movement is to deposit the empty on the passing track; that is correct, isn't it?

A. Provided the train—if the train heads in on the passing track, as they do frequently, then they cut off at the empty car, leave the empty car and the caboose standing on the passing track, into the clear of the spur; they move up 128 feet or 30, whatever it might be,
and they move back down there and get that two loads that
4996 is in there on the spur; they are going to take them with them; they pull back on the passing track and reach down and get this empty with those two loads and pull up again, and sit them down where they are taking the two loads from.

Q. So that involves a stop in order to cut off the empty and caboose on the passing track?

A. Yes, sir.
Q. And then it involves the forward movement, for the purpose of clearing the switch, which would put them on the spur track?
A. Yes, sir.
Q. And then the back movement on the spur track to reach to the cars they want to get there?
A. Yes, sir.
Q. And then a forward movement on the spur track and passing track, to get beyond the switch connection?
A. Yes, sir.
Q. And then a backward movement on the passing track to go back to the empty and the caboose?
A. Yes, sir.
Q. How many movements is that?
A. 6.
Q. For two cars?
A. If they handled it that way.
Mr. HILL: Three cars you said.
4997 A. It wouldn't matter how many cars.

Mr. MOORE:

Q. That just simply illustrates how it varies, and suppose they would stop on the passing track instead of the main track, then they would cut off the caboose and empty; they would make the necessary movement to get the empty on the track they wanted to leave it on, say the passing track, what would they do to do that?
A. They would run up here on the main line, cut off where the empty is, take the empty with them; they might have five or six loads ahead of them; cut off the empty and run up on the passing track?
Q. For the purpose of clearing the switch stand?
A. Yes, sir.
Q. Go past that?
A. Back down and set that car in the clear on the passing track, reach in on the spur and get those two loads.
Q. What would that involve?
A. Back in.
Q. They have set the empty at the place they wanted to leave it?
A. Yes, sir.
Q. They did that in the backing movement?
A. Yes, sir.
Q. They couldn't back farther, they have to move forward then?
A. Yes, sir.
4998 Q. And clear the switch stand, and then what do they do?
A. Get those two loads.
Q. Then what do they do?
A. Pull forward to clear the switch stand.
Q. Then what?
A. Back up and get the empty.
Q. Then what?

A. Pull up to the switch stand and set it back where they took the two loads out.

Q. And then what?

A. Proceed up to the main line with their train, with the two loads.

Q. How many movements does that involve?

A. 7; now then, that is the actual movements they would have to do in that way; now, they are not going to set out any empty, just simply reach in there and get the loads and set them out.

Q. Where are they when they get up to the station—there on the main track?

A. Yes, sir.

Q. Where are you going to locate the loads they want to take out?

A. On the spur track the same as the other was.

Q. You come in on the main track?

A. Yes, sir, at the station.

4999 Q. Now, the two loads that you want to pick up are on the spur track?

A. Yes, sir.

Q. What is the first movement you make for the purpose of picking up the loads?

A. As a rule, the conductor and two brakemen go to unloading freight.

Q. Leave that part out.

A. Cut the engine off, and go up to the passing track switch.

Q. You do that now to clear the switch stand?

A. Yes, sir.

Q. That is a forward movement?

A. Yes, sir.

Q. Then you clear the switch stand, and back down to the passing track?

A. Back down to the two loads on the spur, and pick up those loads and come out.

Q. Then make the forward movement of clearing the switch stand again?

A. You don't have to make any stop; you clear the switch stand on the passing track.

Q. When you have connected with the two loads, you have to go forward and clear the switch stand and get back on the main track?

A. Yes, sir.

5000 Q. And then you back down to your train?

A. Yes, sir.

Q. Supposed you wanted to put those two cars on the rear end of the train, then what would you do—what would that movement involve?

A. Same thing.

Q. Would it involve a movement of all the cars on the train?

A. Yes, sir.

Q. The entire train would have to go through that movement?

A. Sometimes they do this—you mean behind the caboose?

Q. I mean at the rear end of the train?

A. If it is the rear end of the train, it would be behind the caboose.

Q. Suppose it was immediately in front of the caboose?

A. Then they would handle the whole train; let me explain that a little more fully; perhaps if they had charge of the train and were unloading freight, they would back down and pick up those two cars and bring them up to clear in the passing track, and then they would cut off the caboose and back in and get those two cars and pick up the caboose and go ahead.

Q. These illustrate the ways they could do it under other conditions?

A. Yes, sir.

Q. Suppose those two cars they want to pick up were on the spur track; tell the movements they would make to get them off
5001 the spur track.

A. I have just done that; that is off the spur track what I have been talking about; that spur track leads from the passing track, that is what we have been discussing.

Q. Is there any uniformity as to location of spurs at different stations along the line of road?

A. No, sir, there is not, not on these roads here.

Q. To illustrate the thing I have in my mind, you can tell me whether it is a case that might occur or not, suppose you were going into a station from the east, and you wanted to pick up two cars that are on a spur that makes off from the passing track in a westerly direction, and where the switch stand that connects the spur with the passing track, is at the east end of the spur; you want to pick up two cars on that spur; now your train is headed west; what movement would you make to do it?

A. Pole the car out—they frequently pole the car out, provided the switch is close enough to the passing track.

Mr. HILL:

Q. You had better explain what you mean by "poling"?

A. They pick up lots of them—lots of local engines carry poles with them on the rear end of the tank; I have seen many of them,—a pole three or four inches through and a band around each end, and
they put that against the pilot beam; they push those cars
5002 out onto the passing track; they can do that, or in other words, they can reach in and get the car and make a drop of them at the lower end of the passing track.

Q. Tell the movements that would be involved in that?

A. I am wrong about that, about the pilot beam; that wants to be the tank; they cut off their engine at the clearance here; leave room enough from the switch back to their train to receive that car; they move their engine down to where that car is; they put this pole on against that car, and shove that car right back to the train, throw the switch and couple up and go ahead.

Q. Now, in the case that I intended to put, you are resting on the main track with the engine, the head of the train pointing westward; now, we will say your passing track is on the south side;

now, if you use the engine alone, or suppose now you want to put those two cars on the spur track, between the caboose and the rear freight car, now you have got to move your train forward, haven't you, behind the switch stand, so as to get on the passing track?

A. Yes, sir.

Q. Now then, how do you get at the two cars that are on the spur that goes into the passing track from the west?

A. Then we would use the pole on the car, set it against the tank and handle it the same way.

5003 Q. Use the pole on the rear car of the train?

A. Yes, sir, push those cars out.

Q. Tell me how that is done; I don't know; I am asking you for information?

A. They can do it that way; they cut their train off their engine; or do you want some cars to the engine?

Q. I don't care which; the case I put was cars to the engine, because I want it put between the caboose and the rear car?

A. They cut off the cars they want, they go down to the switch and come back to this spur switch.

Q. That is two movements, a forward movement on the main track and backward movement on the passing track.

A. Well, a forward movement; you know the train is down there ready to go ahead.

Q. But you have to back, if your connection with the spur track happens to be——

A. They come up there and they push those cars out on the passing track, and throw the switch and couple up and proceed back to the train again; that would be four movements.

Q. To get those two cars?

A. Yes, sir.

Q. Now, in the case you put, where you pole them in, you will move west with your train until you get past the switch stand, then you will back onto the passing track?

5004 A. Yes, sir.

Q. If you can pole it in, you laid that on the rear car in the train and by that method, you will push those two cars on the spur in the passing track, and get them in the rear of those two cars?

A. Yes, sir.

Q. That involves a movement forward and movement backward, and also a movement of two cars on the spur track, to get them on the passing track?

A. That is involved in the backing up.

Q. It involves that movement?

A. Yes, sir.

Q. When you have got them on the passing track, you move forward until you clear the switch stand again on the passing track?

A. Yes, sir.

Q. And then you back your cars in order to get the caboose onto them?

A. Yes.
Q. How many movements does that involve?
A. Four.
Q. Suppose the condition or situation of those two cars was such you could not pole them in, they were too far away, then what would the movement be, until you got back on the passing track?
A. Go down here, come in on there, and back up those two
5005 cars. (Indicating.)
Q. Then you back past the switch stand that connects the spur with the passing track?
A. Yes, sir.
Q. Then you would go forward on that to reach the two cars?
A. Yes, sir.
Q. Then you would back again on the passing track?
A. Yes, sir.
Q. Then you would go forward to clear the switch stand to get on the main track?
A. Yes, sir.
Q. Then you would go back on the main track to get your caboose?
A. Yes, sir.
Q. How many movements would that involve?
A. Five.
Q. Wouldn't it be six?
A. Yes.
Q. Now, these instances that I have suggested, and the answers you have given, show how the conditions vary, don't they; they vary in nearly every movement; every movement is different from any other movement; I should not think it would be often that two movements would be precisely alike, occurring in a day?
A. It might, putting cars in the same side-track.
Q. If the conductor would have to keep an accurate track
5006 of the mileage that way, he would have to keep a rather extensive account; he would have to keep an account of each of those little movements.
A. Yes, sir, he would have to do that to get it accurate.
Q. Now, in order to spot the cars on more than one track, it may be necessary to make mileage on the passing track, and on the side-track as well, may it not, depending on the conditions and the locations of the cars and the place where you want to spot them?
A. It is frequently that an agent wants a car replaced; it requires just as much time to go in and replace that car as it does to put one in.
Q. In spotting cars, placing them and taking them out, you frequently have to use the spur track and passing track too?
A. Yes, sir, unless they head in on the passing track, as they come into town.
Q. I know there may be conditions when it doesn't exist, but there are conditions when you do even have to do that?
A. Yes, sir, have to use both tracks.
Q. Do you understand that the work sheet used by Mr. Wright,

and from which you have been testifying, shows the actual length of the passing tracks?

A. The length of the side-track may be al- right, but he has got too many movements to set out a car.

5007 Q. I am not speaking about the movements; what I want to know is whether you understand that he gives the actual length of the passing tracks there?

A. He evidently hasn't got the passing track on there; he has got the house tracks, I see; that would be about right for the house track.

Q. About right, you say?

A. I couldn't say it was just right, because I don't know the length of them.

Q. I want to give you another illustration; a train comes in from the east to a station where there is a passing track and a spur track; the passing track is on north side of the main track?

A. Yes, sir.

Q. The spur track connects with the passing track at its east end —at the east end of the spur?

A. Yes.

Q. A train comes in on the main track, from the east; there are four cars setting on the spur track; those cars are numbered consecutively from the switch stand where the spur connects with the passing track, one, two, three and four, and you want to get cars two and four out of that spur and put them in the middle of your train; now, tell me what movements would be involved in doing that.

A. The train will come up here to the east end of the passing track; they will cut off their engine, they will proceed up

5008 the passing track, and reach up here.

Q. Don't use the word "reach in," because that is confusing.

A. They will proceed up the passing track until they get to the switch stand of the spur; they will go in here and they get hold of all those cars.

Q. The four cars?

A. Yes, sir; they will proceed back to the main line; they will set car #4 up here on the main line; they will back up to the switch, put car #3 on the passing track, back up the main line and set car #2 on the main line, back up, get hold of car #3, push it back in onto the spur where the 4 is; the engine will back up and go down on the passing track, go ahead until she gets past car four, and pole car- 4 and 2 down to the train, back the engine out on the main line, couple up and go ahead.

Q. How many movements are involved in that—about 13 aren't there?

A. I didn't notice, but I can tell it to you; 12 I guess.

Q. I understand every movement of the engine is a movement?

A. Yes, sir—13 is right.

Q. Suppose those cars which you want to pick out in the order

which I mentioned awhile ago, were in the house track so you could not pole them out, what would be the movement?

5009 A. Turned on the track in the same direction?

Q. Yes?

A. The spur track goes from the main line?

Q. Yes?

A. They would stop at the head block of the spur; that first movement will be to go in to get those four cars.

Q. You have got to do something before you can do that?

A. No, sir, we stop here.

Q. At the east end?

A. Yes, sir; the engine goes in and gets hold of those cars, gets out on the main line, proceeds to the west end of the passing track; they jerk those cars, make a drop of them, jerk them in or drop them or make a running switch, drop them in the passing track, is four; the engine then proceeds down the main line, passes the head block, backs in on the passing track, gets hold of those cars; six; goes out on the main line, seven; backs down to the train, is 8.

Q. Have you provided in that for the movements that are necessary to get both cars; you remember that you have to get two cars out of there.

A. 12 movements.

Q. Suppose in the case I have cited, there should be a train going in the opposite direction, standing on that passing track at the time?

5010 A. Back them out of the road.

Q. How many movements would be required to back them out of the road?

A. One.

Q. Tell me where you would take it, just tell me what would be involved in that movement; you would have to move the whole train on the main track, wouldn't you? In the opposite direction from the train that we have been dealing with, that came there,—you would have to do that?

A. As I understand you, there is a freight train——

Q. Wait a moment; here is the passing track on the north, to which I call your attention, and when this train comes in from the east, of course that train going west is on the passing track; that train coming in from the east, part of that passing track occupied by a train that comes from the west, you have got to get that train out of the way, so as to get to the spur and reach these cars you wanted to take out; what movement is necessary to enable you to do that?

A. The freight train is meeting the local—let the local run up the main line and the train on the passing track proceed on east, and get out of the road.

Q. Then when you did that, and when the train on the passing track had gone, then what would you do with the local train?

5011 A. Drop it back to the switch.

Q. That would involve another movement of backing the entire train?

A. Yes, sir, provided there was a train in there, or in other words, we could cut the engine off and get up to this passing track and get in and get them.

Q. It would involve an extra movement, if the train is in there?

A. Yes, sir.

Q. In making those movements, they have to make running switches, do they not?

A. Yes.

Q. What is a running switch,—describe it, please.

A. If you want to set a car out here, for instance, and you would run down here three or four hundred feet, past the head block, a man standing on the footboard of the engine or on the pilot, or anywhere he can to uncouple it, and the train proceeds back, or the engine itself, with those two cars, goes back at the rate of six or eight miles an hour, or ten or twelve, whatever they think is necessary, and when they get to where they think the car will run in on the passing track, clear, the engine slacks just enough to let let him pull the pin, and he gives him a signal to back up; this engine backs up the main line; that turns the switch between the engine and cars, letting the cars go in on the passing track.

5012 Q. Doesn't a running switch involve pretty rough handling of the car.

A. Sometimes the man who does that uncoupling, stays with the cars; he gets right up on top to set a brake, if necessary.

Q. In order to get the velocity to create the momentum necessary to carry those cars to the point you want to take them, you have to give them pretty rough usage?

A. Not any more rough usage than there would be in regular work, unless they come back against some cars.

Q. But the great hope of the personal injury lawyer is to get a case where there is a running switch, and that is because of the rough handling of the cars that it is supposed to be dangerous.

A. The cars would not be handled any rougher there than anywhere else, unless they go back and strike other cars.

Q. As a matter of practical operation, there is frequently a great deal of danger?

A. Not any more than any other switching.

Q. Do you know the average cost of car repairs?

A. No, sir.

Q. Or engine repairs?

A. No, sir.

Q. That is a subject you have no familiarity with?

5013 A. No, sir, I am not versed on that.

Q. Or the cost of the maintenance of cars?

A. No, sir.

Q. Is a coal car of 100,000 capacity a very large car?

A. Yes.

Q. One of the largest that is made and operated?

A. No, sir.

Q. It is a very large car, extreme type of car?

A. Yes, sir, that is about the largest there is; I have seen 150,000 capacity cars—the Southern Railroad Co. has a 150,000.

Q. There is 8 driving wheels under an engine, I believe—I am speaking of driving wheels?

A. On some trains eight, and some four, and some six.

Q. Now, there is eight wheels under a car, isn't there?

A. Yes, sir.

Q. Now, Mr. Roberts testified yesterday that the wheel base of a car is 30 and a half feet; that the wheel base of an engine with eight wheels is 13 or 14 feet; I don't know but what he said 12 or 13.

A. 13½.

Q. What effect in the way of concentrating the weight of the load, does that difference in length of wheel base, have; doesn't it have the effect of concentrating the load,—the weight?

A. Of the car or engine—you are speaking of?

5014 Q. The weight, whatever it is, whatever it is, the weight of the engine or weight of the car, take the body of the car, in case it is the car, and the body of the engine, in case of the engine, isn't the weight very much more concentrated on the short wheel base of the engine?

A. The engine, we will say, has eight drivers and the trucks.

Q. You said four, six and eight; take six; what would be the wheel base if it had six drivers?

A. I don't believe I could tell you offhand.

Q. It would be less?

A. I am not an engineer you understand.

Q. Well, I understand it is 13-½.

A. The two front drivers are closer than the two back ones, and then there is a pair of trucks yet under that engine, or even a set of trucks; there is a pair of wheels in the front part of the engine; that engine, if I understand it just right, the weight is distributed the full length of that engine, on the six drivers and the truck.

Q. I think Mr. Roberts testified that the weight would be more concentrated on an engine than on a car; that is a fact, isn't it?

5015 On a car, the half of that carload is on the trucks, on one pair of wheels, on one truck; that would give more weight in one place than it would on the engine.

Q. And the wheels are under the trucks, are they not?

A. Yes, sir. Now, say the car is 50 feet long, one of those 100,000 capacity; there is lots of them 50 foot cars; 25 feet of that car weight is on the front trucks and 25 feet is on the back trucks, where on an engine, the engine is on the six drivers and the pair of trucks; in other words, it is on ten wheels and the car is on four.

Q. I think Mr. Roberts, who is perhaps more familiar with that subject than you, or I either, testified yesterday that an average car had eight drivers, and that there would be a greater concentration of weight on the wheels of the engine than there would be on the wheels of the car?

Mr. HILL: I didn't understand Mr. Roberts that way.

Mr. MOORE:

Q. Now the point I want to get at is this, is the weight on the 8 engine wheels greater than the weight on the eight car wheels?

Mr. HILL: Do you mean per wheel, or the whole amount?

Mr. MOORE:

Q. I am speaking of the driving wheels of the engine.

5016 A. If the engine is heavier than the car——

Q. Assuming that it is the same weight.

A. No; if the gentleman there will give me the length from the pony trucks, as they call them to the back drivers——

Q. I am just speaking of the driving wheels, the weight is on the drivers, as I understand; 113 feet is the wheel base.

A. It is from one wheel to another, but what is it from center of the back driver to the center of the front driver?

Q. Mr. Roberts testified yesterday it was 13 or 14 feet—the wheel base, any point between the two, from outside to outside; we will assume that it is about 13 feet.

Mr. HILL: I don't believe that is quite a fair examination; Mr. Simmons said he was not a mechanical man; I haven't asked him any questions about mechanics at all.

Mr. MOORE:

Q. I will put it a little different; I will assume, whether it is correct or incorrect, that there is a greater concentration of weight on the driving wheels of the engine than there is on the wheels of the car, both on account of the manner of loading, and on account of the fact that the engine is heavier than the car.

A. If the gentleman will tell me the distance between the wheels of the truck, from center to center of a car truck?

5017 Mr. ROSING: 5 foot six, same distance there is between the two drivers.

A. Then I think there is more strain on the car than there is on the engine; you have 13-½ feet, and you have 11 feet the other way.

Q. I don't understand what you mean; I thought there was 30-½ feet on the car—the wheel base is 30-½ feet on the car.

A. Yes, sir, but that gives a harder strain on the car than on the engine; I don't think I could just explain why, but I do believe that I know it is harder on the track; the car than the engine.

Q. Assuming that there is a greater weight on the driving wheels, on account of the difference in length of wheel base, and on account of the greater weight of the engine than the car, if that were true, would it not result that the engine would be likely to produce more damage to the track than the car?

A. I think not, on account of the wheels, which are larger on the engine than they are on a car.

Q. The gentleman testified yesterday that the engines were provided with more efficient springs, which protected the engine itself and operated them in certain ways with which you are perhaps

familiar, wouldn't that have a tendency to diminish the injury of the engine on the track?

5018 A. I think so. Now, let me make a little remark on that; there is many scales on the system that you cannot weigh a fifty foot car; they weigh that car, half at a time; what I mean by that is, they weight the front end and then they shove the other end on and weigh it, or take half the weight; we had those scales at Fort Smith, until they have just overhauled them.

Q. The car is longer than the scale?

A. Yes, sir.

Q. Mr. Roberts testified yesterday that they have to classify engines for the purpose of selecting those that can go over certain parts of the tracks, and keeping certain engines from going over weaker parts of the track, and also, they classify them for bridges, in order to keep particular engines for particular bridges, and that there is no classification made of that kind for the car; if the car inflicts greater damage on the track, why do they have to classify engines and do not have to classify the cars?

A. I can cite you to a road that won't let a hundred thousand capacity car go over her road, if she can possibly help it and that is the Arkansas Central.

Q. How is it on the Iron Mountain.

A. That is the Iron Mountain system,—the Arkansas Central.

Q. You say they won't let a hundred thousand car go over the system if they can help it?

5019 A. The conductor has orders not to take them; that is the Iron Mountain.

Mr. HILL: So reputed in our neighborhood?

A. Yes.

Mr. MOORE:

Q. Is the Arkansas Central part of the Iron Mountain Road; isn't that a little branch that runs down from Fort Smith to Paris, isn't that a different road from the Iron Mountain?

A. It belongs to the system; it is handled independent.

Q. The stock of that corporation may belong to the Missouri Pacific Railroad Co.——

Mr. HILL: I think Mr. Johnson testified that it did.

Mr. JOHNSON: No, sir, I testified I didn't know anything about that.

Mr. MOORE:

Q. Isn't the Arkansas Central a separate corporation, or do you know about that?

A. It is handled independent, but of course, I have no way of proving that it belongs to the Iron Mountain, but I am satisfied it does.

Q. You really don't know anything about that?

A. No, sir.

Q. And it is the Arkansas Central you refer to as refusing to take a hundred thousand pound car?

5020 A. Yes, sir; I loaded a car of sand, is why I know this, and the conductor refused to take it.

Q. You have never operated a train as an engineer or conductor?

A. No, sir.

Q. When did I understand you to say you severed your connection with the railroad service?

A. 1907, I believe—June 16, 1907.

Q. Where were you living at that time?

A. Ferriday, La.

Q. When did you move to Fort Smith?

A. Probably eight or nine days after that, about the 20th of June.

Q. What business did you go into there?

A. Sand business.

Q. What was your position on the Louisiana Road?

A. Division Engineer.

Q. You mean civil engineer.

A. No, sir, division engineer; that is, have charge of the bridge and building, track and everything on the right-of-way.

Q. Did you sever your connection with the railroad company on account of differences you had in connection with the officials of the road?

A. Yes, sir.

Q. I didn't mean to ask you what it was?

A. Yes, sir.

5021 Q. Were you discharged?

A. No, sir, here is my resignation; I sent in my resignation on the 7th of June and received relief on the 16th; I never was discharged in my life, but not only that, I am doing business with them now.

Redirect examination.

By Mr. HILL:

Q. Your relations with the Iron Mountain have always been pleasant?

A. Yes, sir, I have my clearance in my pocket.

Q. Mr. Moore has questioned you as to a great many switching movements here, which you have explained at length; I will ask you if those are the usual and ordinary movements in the operations of local trains?

A. No, sir, they are rare movements.

Q. Did you take into consideration those rare movements, as well as all other movements, when you made your estimates you have heretofore given?

A. Yes, sir.

Q. You took it by large and by small?

A. Yes, sir, because I am very familiar with that movement of trains; that is not done very often.

Q. It can be done and is done as illustrated there, I presume occasionally?

5022 A. Yes, sir.

Q. I believe he asked you, if in order to get an accurate statement of the mileage, the conductor would have to keep track of all these movements; I will ask you if to make a fairly accurate approximation of the mileage, you take the business that is done, if it is not very much along the same line, and you can make a fair approximation if you are familiar with the road and the way it is handled.

A. Yes, sir, a local conductor could, a good deal better than I could.

Q. Of course, he would have to take in consideration these unusual and abnormal movements that have been asked about, as well as all others?

A. Yes, sir, very often they do not stop at all.

Recross-examination.

By Mr. MOORE:

Q. When trains meet at stations, they frequently involve a more complicated movement where there is switching to do than it would ordinarily, wouldn't it?

A. The side-tracks are provided for that purpose, and there should not be but very little detail.

Q. But if the passing track is occupied and it has to be used in making a switch, it complicates the problem and increases the amount of switching to be done necessarily?

5023 A. The train would have to move up.

Q. Doesn't it occur, when through trains meet, that there is really more complicated movements than those I have illustrated awhile ago, in practice?

A. Yes, sir, the local has to take the siding to let the through freight pass by; it is not very often that a through freight takes a siding.

Q. Such movements as I illustrated, have to be made when there are cars to be picked up which are scattered along on the side-tracks.

A. The movement I illustrated has got to be done that way—there may be some other way it could be done.

Witness excused.

5024 HUBERT F. JERNIGAN, being first duly sworn and examined, in rebuttal, testified as follows:

Direct examination.

By Mr. HILL:

Q. I wish you would state your name, age, residence and present occupation?

A. Hubert F. Jernigan, 34, present occupation working for Citizens' Investment & Security Company as clerk.

Q. Residence?

A. 2608 West 14th St., Little Rock.

Q. You had several years of railroad experience; I wish you would state in brief, just what experience you have had in railroad service?

A. My first experience was with the Iron Mountain on the Central Division, commencing somewhere in the Spring of 1903, and ending somewhere in the fall or Early Winter, about Christmas, 1903.

Q. In what capacity?

A. As Brakeman.

Q. Then what was next?

5025 A. I quit railroading for some two or three years, and went to the Rock Island in 1906, and stayed until the latter part of 1907.

Q. In what capacity?

A. Brakeman.

Q. What run did you have on the Rock Island?

A. Freight service only; I had a local sometime, through freight, and work train.

Q. What division did you work on?

A. Both divisions out of here, east and west.

Q. That is from here to Memphis and from here to Booneville?

A. Yes, sir, most of it was on the east end from here to Memphis.

Q. Are you familiar with the way local and through freight trains are handled?

A. Yes, sir.

Q. You have had no passenger experience?

A. No, sir.

Q. You quit railroading in 1907?

A. Yes, sir.

Q. What part of 1907?

A. It was in the last of 1907,—September, or October, or November, something like that.

Q. It has been testified in this case that it is impossible and impracticable to make any fairly accurate estimate of the amount of switching done by a local freight engine,—that is the switch-

5026 ing mileage don by it; I will ask you if in your experience, you think that a fairly accurate estimate can be made of the switching mileage of a local engine or an engine in local service and if so, how you would do it?

A. Well, I couldn't figure that anyway, only by figuring the time put in.

Q. How would you do that?

A. For instance, take a division—for illustration, a division of 100 miles, and a local on that run will put in at least 16 hours, and figuring the running time at 20 miles per hour——

Q. That is the running time between stations?

A. Yes, sir, that will leave you 11 hours for switching and unloading freight, and other work.

Q. Just take a run and illustrate that,—any run that you are familiar with?

A. I can follow it up from here to Brinkley, pretty well, because I am better acquainted with that—it is a 63 mile run.

Q. Just follow that run, if you are more acquainted with that?

A. Leaving out of here, say seven o'clock in the morning, my first stop would be Galloway, and there is usually some local for that place—merchandise, and possibly a switch or two to make, and the next stop will be Kerr, four miles from Galloway, usually
5027 spot a car or two there, and merchandise; the next stop will be the tank—there is a spur between there and the tank, usually stop there at the saw mill, and then at the tank, and the next stop will be Lonoke, 20 miles from here; I cannot get my stations in there between Lonoke and Carlisle now, cannot remember the names of them, but anyway there is about one stop in there, and then comes Carlisle, and there is two stations between Carlisle and Hazen, at which there is most always a stop, and then from Hazen there is Mesa; there is always a stop there from one to three hours at Mesa—hardly ever any merchandise to unload there; at DeValls Bluff, a mile from there, there is a good deal of switching on account of those mills, button factories and one thing and another.

At Biscoe, there is another stop there, and some merchandise to unload, and then there is a stop at Brasfield, and one at Eden, and that puts you at Brinkley, the next stop.

Q. At about what speed does your engine make the switching?

A. I should judge four or five miles an hour, put it at that—five miles anyway.

Q. When you get to a station on an ordinary run, how do
5028 you arrange your switching—how do you go about it, to handle the switching that is to be done?

A. We know what we have to set out, if any, and then we go to the agent and get a switch list of what switching he wants done, and then we go to the track and look up the number of cars we have to move, for instance, between the house track and so on, and what we had to pick up and then we go on with our work, as soon as we get everything looked up.

Q. While you are arranging that, what is your engine doing?

A. Usually standing still, or one man has the engine getting it in position.

Q. I suppose there is a great deal of variation in switching at stations, owing to the difference loads you have to pick up and set out, and the different modes of handling and all those matters?

A. Yes, sir.

Q. I will ask you if anyone thoroughly familiar with the road can make a fairly accurate estimate of the amount of switching that is usually done, that is, taking the extremes on one side, the most switching it does, and the least switching it does, and the ordinary run, if you can make a fairly accurate estimate of the average conditions?

A. That would be pretty hard to do, from my recollection of the run now.

5029 Q. I am not speaking of your recollection now, take anyone thoroughly familiar, take it at the time you were running

there and knew of the conditions, could you make a fairly accurate estimate of the mileage done in switching on that run?

A. I don't believe I could.

Q. I am not asking you to do it now?

A. You want to know if a man could.

Q. Yes?

A. I should think so.

Q. I understand you have been out of it for several years, and you don't recall all these things?

A. Yes, sir, I have been out three years.

Q. I am not asking you could now, but if you were familiar with that and making the run every day, you could make that estimate?

A. I should think a man ought to.

Q. Could he make it with reasonable accuracy?

A. Yes, sir.

Q. You would work it out on the time?

A. Yes, sir.

Q. On that Brinkley division, how much time did you say was allowed for your run?

A. I figured awhile ago on a hundred mile division.

Q. That is about the average division.

A. Yes, sir, what I illustrated there was only 63 miles.

5030 Q. Take your one hundred mile run, how many hours would be allowed for one hundred miles?

A. I don't know a local run of one hundred miles; the time on the local from here to Brinkley is considered ten hours, may be eleven, for sixty-three miles; that gives them time to include the switching and all, as well as I remember.

Q. About what time did you generally make?

A. Between stations or over the division?

Q. Over the division?

A. We usually put in about 12 to 14 hours, sometimes more.

Q. About what time would you make on that run between stations?

A. 20 to 25, or 30 miles an hour. We ran 25 miles right along.

Q. Then you would take that running time, what you usually made while running, deduct that from the time that you took over the division and count the difference as done in switching?

A. Yes, sir.

Q. That wouldn't represent all the time lost either, would it?

A. No, sir, there is time meeting trains we couldn't be switching.

Q. Taking water too?

5031 A. Yes, sir.

Q. Waiting at the station here, getting your list?

A. Yes, sir, and also there is the unloading of your merchandise, the engine is standing still then, while you are doing that.

Q. If you took your plan of making it, you would still have an excess of mileage allowed for switching, wouldn't you?

A. Not much.

Q. You say you would be counting your train as switching while

part of the time would be lost in doing these matters you have mentioned?

A. Yes, sir.

Q. It is in evidence in this case by the railroads, in an exhibit they have filed, that the local train stops about eight times to the through stopping once, I wish you would explain in ordinary railroad practice, what stops a through train necessarily makes in its run?

A. It is stopped for orders and for water and fuel, and meeting points and junctions.

Q. What about meeting other trains?

A. That is meeting points, meeting other trains; that does not say anything about setting out of bad orders, and picking up perishable stuff loaded since the local had passed.

5032 Q. That doesn't count the work that the through train does, picking up cars and setting them out?

A. I left that out.

Q. That sometimes occurs?

A. Yes, sir, very often they have to set out bad order cars, and most always, in a through freight run, you have one or two to set out at different stations along the road.

Q. Take the stops of a local, about how many are necessary stops for a local?

A. On an average,—it is a good deal owing to the population, the distance apart of the stations.

Q. Take one of their average runs, on the Rock Island, I presume that is the line you are familiar with?

A. They stop on an average of every five or six miles.

Q. If this through would be eight to one, that would be making the through stop about every forty or fifty miles?

A. Yes, sir, but they would cut that half in two; they stop about every three or four times—the local stops about every three or four times to the through.

Q. Explain just how that is, take an average run—by an average run, I mean *would* that would fairly illustrate usual conditions?

5033 A. You can take the Rock Island fast freight run from Memphis here, and without stopping to meet trains or stopping for orders, they have about eight stops?

Q. What is the distance?

A. 132 miles from Argenta.

Q. That is the best time they make?

A. That is without stopping for orders or meeting trains?

Q. We are taking an average run, taking in what it really stops for meeting trains and all that, about how many stops would that make?

A. On an average, meeting trains, it would stop at least ten or twelve times.

Q. They would be stopping——

A. They will stop every fifteen to twenty miles anyway.

Q. The best they can make?

A. Yes, sir, the best they can do.

Q. Are you familiar in general freight service, with the way they handle the red ball trains, or fast freight trains?
A. In what way?
Q. There is such a train as that?
A. Yes, sir, the Red Ball train is a fast train.
Q. How does the handling of that train differ from other through freight trains; does it stop as often or does it do any work?
5034 A. Not necessarily; they usually go over the road faster than other trains.
Q. It gets over the road faster than other through trains?
A. Yes, sir.
Q. When it gets into a terminal, what is the difference between it and other freight trains?
A. Not any; it is broken up like the rest of them.
Q. You don't find them shunting them right through, as a general rule?
A. No, sir, there may be some trains once in awhile that will go right through, but very seldom.
Q. When you find a train that goes through that way, is it one of these red ball trains?
A. Yes, sir, usually.
Q. Are other through trains broken up more than their red ball trains?
A. Not in a yard like this, except in rare cases.
Q. Don't they have a lot of through trains, classed as through trains, that pick up cotton and things like that?
A. They pick up cars of different stuff.
Q. They will be broken up in the terminals too?
A. Yes, sir.
Q. Your idea is that all these trains get broken up, whether they are throughs, red balls or locals?
5035 A. Yes, sir.
Q. It is just a question of degree, a red ball will get broken up the least of any?
A. Yes, sir.

Cross-examination.

By Mr. MOORE:

Q. I believe you began the railroad service in the spring of 1903, on the Central Division of the Iron Mountain?
A. Yes, sir.
Q. And continued until the following winter?
A. Sometime in the fall or early winter.
Q. Where was that service?
A. On the Central Division of the Iron Mountain.
Q. That is the Little Rock and Fort Smith line?
A. Yes, sir.
Q. Then you went out of the service?
A. Yes, sir.
Q. How long were you out of the service?

A. Until the Spring of 1906, I guess it was.
Q. How came you to quit the service at that time?
A. Of my own accord, to take a position in a store.
5036 Q. Then you went to work on the Rock Island in 1906?
A. Yes, sir.
Q. What time in 1906?
A. Early summer, latter part of the spring or early summer.
Q. You quit the railroad service again in 1907?
A. Yes, sir, November.
Q. That service was on the Rock Island?
A. Yes, sir.
Q. The character and amount of switching varies, I suppose, from station to station?
A. Yes, sir.
Q. Depending upon local conditions at the different stations?
A. Yes, sir.
Q. And also, I suppose it varies from day to day, depending on the condition of the traffic?
A. Well, not very much.
Q. You could not estimate that the switching at each station would be uniform from one day to another?
A. It would not be exactly the same, but practically the same amount would be performed on each day; the stations out on the east end would be almost the same each day?
Q. You had no experience on the main line of the Iron
5037 Mountain Railroad?
A. No, sir.
Q. I suppose you know very little about their red ball trains?
A. Nothing only the talk I heard from the brakemen on the Iron Mountain when I was switching with them.
Q. You know nothing of your own knowledge?
A. No, sir,—and my general observation.

Witness excused.

5038 D. HARSTON, being first duly sworn and examined, in rebuttal, testified as follows:

Direct examination.

By Mr. HILL:

Q. Please state your name, age, residence and present occupation?
A. My name is D. Harston, age 37, and I am engaged in the dry goods business.
Q. In what place?
A. In Argenta, reside there.
Q. What railroad experience have you had; I wish you would just give a little biography of the railroad service you have had, beginning at the first?
A. My first railroad experience was with the Mountain, working in a bridge gang, and later in the water service for the Mountain,

later with the old Little Rock and Memphis, as brakeman and conductor; then with the Mountain as switchman, and I worked two or three years for the Rock Island as conductor, brakeman and switchman, and assistant yardmaster; ran a train on parts of the Iron Mountain, and broke there; yardmaster on the Union Pacific, and conductor on the Valley Division of the Iron Mountain, and yardmaster at McGehee for awhile.

5039 Q. Your service all been in freight?

A. Yes.

Q. Haven't had any passenger service?

A. No.

Q. When did you leave the railroad service?

A. About two years ago.

Q. You have been conductor on both local and through trains?

A. Yes.

Q. Brakeman on both local and through trains?

A. Yes.

Q. What divisions have you had service on, on the Iron Mountain in Arkansas?

A. I have worked on what is known as the Central and Valley Divisions, and also on the White River.

Q. It has been testified to in this case by the Railroad witnesses in rebuttal, that it is impossible to make an accurate estimate of the amount of switching mileage made by a local locomotive—take a run, for illustration, of 100 miles of a local freight train, can you or anyone thoroughly familiar with that run, and with the service, make a fairly accurate estimate of the amount of switching mileage performed by the local locomotive?

5040 A. About the only way that I would know of, that it could be estimated, would be to take the length of time at each place that they were switching.

Q. Can anyone familiar with the road do that; I don't mean could you do it now for occurrences several years ago, but take a man in the current work?

A. I think he could; that is, he could estimate somewhere in the neighborhood of the number of miles.

Q. What I mean is the general average condition; of course, I understand these things would vary every day.

A. Yes, sir, some seasons of the year, the switching would be very much heavier, but I believe a person could estimate within a few miles.

Q. Take in detail, how would you estimate that, take a run of 100 miles, or any actual run that you are thoroughly familiar with, and make your estimate on that?

A. If I was going to figure up the number of miles I made in switching, I would take the time I was engaged in switching, the length of time at each station, and an engine in switching, seldom runs faster than ten miles an hour———

Q. It don't often get that speed?

A. Very seldom.

Q. What is about the average speed of an engine engaged in switching?

5041 It runs from nothing to about eight miles an hour; there is more time consumed in stopping, or as much, than there is in an engine running ten miles an hour; it would make an average of possibly five miles an hour or possibly not as much.

Q. Take that as a factor, say an average of five, then how would you get at your mileage; I interrupted you to get at that point.

A. If I figured thirty minutes switching time at each station, I would figure I would run two and a half or three miles; that is, I would keep the time of switching I had done, and add it up and make it into hours, and average it about five miles, or may be not so much.

Q. Can't you take a run you are familiar with, and figure it out, just the time you would spend in making the run and the amount of time you would spend in switching?

A. It is quite often done; I don't know whether any account is made of it, and charged up in that way, but in a man's delay report, that they had at the time I was with the Iron Mountain, we had a blank for delays; we would show the name of the station, what was the cause of the delay; if a man was at a station an hour unloading local, say for 40 minutes, and possibly switching 20.

5042 Q. By unloading local, do you mean less than carload commodities?

A. Yes, sir.

Q. We have been calling that, in this case, L. C. L. commodities?

A. Yes, sir.

Q. You are referring to the same thing in calling it local?

A. Yes, sir.

Q. Go ahead?

A. I believe I have about finished.

Q. Take the average local run in Arkansas, with which you are familiar, something like seventy or seventy-five or one hundred miles, something like that, what time was usually consumed in making that run from division to division?

A. From 10 to 14, and I have been on the road 24 hours, on a division of from 96 to 101 miles.

Q. Those would be extreme cases?

A. That is extreme cases.

Q. Take the average, making an allowance for extreme cases and quick runs?

A. I don't believe the time should average, considering good seasons, as much as 15 hours a day.

5043 Q. Of the 15 hours, as an average run, part of that would be in switching, and part of it would be lost in waiting for other trains, and waiting for orders, and things of that kind?

A. Taking water, orders, meeting trains, unloading merchandise.

Q. Then of that 15 hours, how much of it, in your judgment, would be used in actual running on the road, and how much in switching, and these other causes?

A. In a hundred mile division, seven hours to eight, I think, would

be a pretty fair estimate in running over the division, what we would consider running time.

Q. About half the time would be spent in making the run from station to station?

A. And meeting trains and other details—unloading.

Q. And not over half of it would be spent in switching?

A. Not, it couldn't be half.

Q. About how much, taking the average conditions, and average run, just make an estimate on average conditions of an average run, what amount of time would be spent in switching?

A. I don't think, in average conditions, the amount of time spent in switching should exceed three or four hours?

5044 Q. Then you would put that switching at three or four hours,—at what speed?

A. About five miles an hour, I don't think it would exceed that; I don't believe it would be that much.

Q. Would it be difficult for a man thoroughly familiar with each run, to make these estimates and give a fairly accurate mileage of the switching done by a local locomotive?

A. A man should, I think, that was working, as I said, his delay reports should show the time that was consumed in running between stations; that is, the dead time at stations, and what he was doing in those stations, and show the number of hours consumed in the switching.

Q. This is a proposition to which his attention is necessarily directed by these reports he has to make out?

A. It should be, yes.

Q. I believe you stated you had service on both through and local trains on the Iron Mountain in Arkansas. It is in evidence in this case, on both of the railroads, that the local stops eight times as often as the through train; I would ask you to state your opinion on that proposition?

5045 A. That a local made eight stops where a through train made one?

Q. Yes?

A. I don't think so.

Q. That doesn't square with your experience.

A. I don't believe it would.

Q. Explain the various stops made by each, will you?

A. As a usual thing, when business is good, a local will stop at almost every station.

Q. As a general thing, about how far are those stations apart?

A. I don't think they would be less than five or six miles apart; I don't know whether they would average that close or not; I never figured them down, but I would think five or six miles between stations; they would have to make water tank stops, and they would have to meet other trains.

Q. You are referring to the through or local?

A. Locals, in making each station stop; they would have to make the water tank, and then the crossing stops, while in through trains, they would make the water tank stops, the crossings, and meeting

points with other trains; with superior trains, trains that had been given the right over them.

Q. What about orders?

5046 A. Orders too; you take between here and Pine Bluff, 42 miles, I believe, and I don't know that I ever went out from here to Pine Bluff without making a stop to meet something, or to get orders; also, had to stop for the crossings, and there are very few trains that are full tonnage trains, that will run from Argenta to Pine Bluff with a tank of water.

Q. That would mean one water stop?

A. Yes, sir.

Q. Suppose they had a bad order car in the through train, what would you do with that?

A. That is according to the nature of the defect.

Q. Do they carry it along or set it out—I presume you mean according to the nature of the defect, they do one or the other?

A. Yes, sir.

Q. Is it frequent or infrequent, that a through train stops to set out a bad order car?

A. It is not infrequent that they stop to cool a hot box or brass one,—sometimes they set out cars.

Q. What freight trains does a through have to take siding for?

A. In most cases, I believe in all cases, for passenger trains, which would be first class on the time table. They are superior to

5047 second class, and it is according to what class the through freight is in, what trains would be superior to it; you take some trains, and they could be second or third class trains and still be a through train.

Q. And such second or third class trains would take more sidings than others?

A. Than their second class.

Q. What effect would the traffic on the road have?

A. It would cause stops oftener.

Q. The road with the heavier traffic, and single track, would have more frequent stops than one of light traffic?

A. Yes, sir.

Q. What would be your judgment about the comparative stops of the local and through train, taking an average run and an average condition on the Iron Mountain in Arkansas?

A. Well, on the parts that I am familiar with, I wouldn't think that a local would stop more than three or four times as often as a through freight would; that is, as a train running as a through freight.

Q. You have made out wheel reports, I suppose?

A. Yes, sir.

Q. And are familiar with the system on the Iron Mountain of making wheel reports?

5048 A. Yes, sir, was when I was working there.

Q. The wheel reports have the following on the back of them: "Cars must be reported in train order, commencing with the caboose, to show make-up of trains leaving district terminals."

Are you familiar with that.

A. I have made them out.

Q. You say you have made these?

A. Yes, sir.

Q. Explain the system of making them, in force on the Iron Mountain?

A. If I am not mistaken, the instructions read to make them beginning from the caboose, but I usually made the wheel reports from the engine back, and running on the Valley Division, they made the head end of the train up first; I naturally started back from the head end.

Q. That would make it in sequence, whether you began from one end or the other?

A. Yes, sir, in putting them down on the wheel report, I usually started at the top of the page and followed them on.

Q. Was this direction which I have read you, carried out in actual practice on the Iron Mountain?

5049 A. As far as I know it was, as much for their convenience as anything else.

Q. Was that a more convenient way of doing it than any other?

A. We stood less chance of overlooking any cars and getting them all on the wheel reports.

Q. Are you familiar with Red Ball #55 on the Iron Mountain?

A. I have worked in the yards, but I never rode 55.

Q. You know what the train is?

A. It is a high class merchandise train.

Q. How does that train compare with other through freights on the Iron Mountain, in the way it is handled?

A. It is handled in preference, as a usual thing, because they are higher class freight; the Red Ball is moved with more dispatch.

Q. How is it handled in the terminals as compared with other through trains?

A. It is now gotten in and out in as short time as possible.

Q. How much switching is done on that train in the terminals?

A. I don't know what is being done—I don't know what changes have been made since I left; at the time I was working there——

Q. What I want is the switching done in terminals on

5050 that #55, as compared with other through trains, whether it was more or less?

A. At that time, there was considerable switching done on #55, from the fact that they brought 57's stuff—that was the Valley fast train—down on 55 at that time, and it had to be thrown out; there was stuff for Little Rock proper, that had to be switched out, and I have worked on that train, when there was possibly 25 or 30 minutes hurry-up switching on it.

Q. Now, compare the switching that would be done on other through trains with that—the average conditions, I am speaking of.

A. With other through trains, there are other through trains that have come into the terminals in almost as good shape, while there are others that there has been almost one in and one out all

the way through—that is, switching for almost—possibly there would not be two cars for the same place, but what there had to be switches made on them—like lumber for Louisiana, possibly some would be going to the Central Division—possibly some south; possibly some to Thebes, and possibly some to St. Louis.

Q. Did you have experience on the railroad, either in
5051 braking or switching, in the days of the old equipment, link and pin couplers and hand brakes, and also in the days of the automatic couplers and air brakes.

A. I had some experience with the link and pin, that is before the automatic became generally used; when I first went to railroading, they were scattered, and there was a great deal of coupling with link and pin couplers.

Q. You observed the operation of trains, and had experience with the operation of trains in both kinds of equipment?

A. Yes, sir.

Q. In this case, there is an issue as to the amount of damage done to freight cars in stopping and starting of trains; an issue has been made up, as to whether more damage or less damage is done with the modern equipment or with the old equipment. I wish you would give your experience on that, just take the stopping and starting of freight trains under the old system and under the present.

A. In my judgment, there would be more damage from the link and pin, from the fact that there was more slack; in starting a train, the head end, the engine would have more start, jerk the hind end more, and in stopping, it would be the same way; especially in switching, what air they had would be out, and the head end
5052 would stop, and the slack would all run up in a bunch; if the cars were loaded with lumber, it would be more liable to knock out the ends, and possibly do more damage to the draw bars, that is as to the cars handled.

Q. I am referring to it, car for car?

A. Yes.

Q. Take the damage done to cars in switching; would there be more or less damage to the cars under the old system than under the present?

A. More with the link and pin, because there was more starts and more sudden stops and more slack to bunch up.

Cross-examination.

By Mr. MOORE:

Q. You say there were more starts and more sudden stops with the old system than with the present?

A. Yes, sir, that is in the switching; the jar was more severe.

Q. Have you ever worked in the repair shop?

A. Very little.

Q. Do you have any special knowledge in regard to repairs, cost of repairing?

A. No, sir, I have no knowledge as to the cost of repairs.

5053 Q. You have no knowledge of the distribution of the repair accounts?

A. No, sir.

Q. It is not in the line of the work you were engaged in?

A. No, sir.

Q. Are the switching facilities, such as passing tracks, side-tracks and spurs the same at all stations on the roads you have worked on?

A. Are they the same at all stations,—in which way?

Q. I mean the same lay out of the side-tracks and spurs, and the same length of tracks, and spurs?

A. Do you mean of the same length?

Q. I asked you if they were all alike, or are they different at different stations on the roads you have worked on?

A. I don't exactly understand the question—alike in what way—as to the location or as to the law of the ground?

Q. I am not speaking about the law of the ground; do they have the same switching arrangements, same arrangements of side-tracks and spurs at all stations?

A. They don't have the same at all stations, because there is more tracks at some stations than at others.

Q. There is a great variety and there is no two stations exactly alike in the arrangement of spurs and side-tracks?

5054 A. Yes, sir, there are lots of them a great deal alike, possibly just a few car lengths' difference in length.

Q. At some stations, I suppose, the passing track would be on the north side of the main line and the house track possibly on the opposite side—that is the case, isn't it?

A. Yes, sir.

Q. And sometimes the house track would be on the opposite side of the station house from the main track and sometimes on the same side?

A. There is a very few places where the house track is on the same side as the main line, because the main line at stations, is fixed convenient to the unloading of passengers.

Q. Doesn't the amount of side-tracks and spur tracks, depend upon the character of business at the station?

A. Yes, sir.

Q. And the number of industries and amount of switching that is necessary to be done at different stations?

A. Yes.

Q. Take a station for instance, like De Vall's Bluff, on the Memphis Road, there is a great deal more switching required there than at some other stations?

A. Yes, sir.

Q. And the same is true at Brinkley?

A. Yes, sir.

5055 Q. It may be so at Forrest City, how is that?

A. There is considerable yard room trackage at Forrest City.

Q. Another thing, I believe you stated a while ago, that the amount of switching at times depended upon the traffic?

A. The amount of switching depend upon the traffic?
Q. Didn't you state that a while ago?
A. It don't depend on the traffic; it depends on the stuff that is moving from the stations.
Q. That is the traffic, isn't it?
A. In one sense, but it could be through traffic——
Q. I mean the traffic at the stations?
A. Yes, sir.
Q. Does that vary at different times?
A. Yes.
Q. How did you find it in that respect—was the switching at stations along the road pretty much alike or different?
A. It was different.
Q. How was it with regard to the different periods at the same station?
A. The seasons had something to do with different stations.
Q. Were there variations in the amount of switching to be done at some stations from day to day and from time to time?
5056 A. There was some difference from day to day and also from time to time.
Q. I believe you stated they would be switching two or three hours at a station some days; that would depend upon the amount of business for that station?
A. That would be for the amount of business at the time; naturally if the business was heavy—the switching was heavy and would take more time.
Q. In the nature of things, I suppose there cannot be regularity in that respect?
A. I suppose not.
Q. How many spurs or side-tracks are there at De Vall's Bluff?
A. I don't know; there used to be, when I was on the road there, one that joined the main track a few yeards past the station, a little saw mill, that De Vall's Bluff did the billing for, and leaving back of the house, was a track that ran around to a button factory, and there was one next to that where they loaded ties, and a little spur dropped off from that, where they were loading some heading, and then there was a track that went straight towards the river, with four or five or six little tracks, called the run-around tracks.
Q. The amount of time and work you would have to put in switching at De Vall's Bluff would depend upon the location
5057 of the cars left there that you would have to spot?
A. Yes, sir, and location of the cars going out.
Q. And it would be just as variable as the locations there?
A. At different times, yes.
Q. I believe you said you ran as high as from the start to ten miles an hour, in switching?
A. I guess there was times when the engine would be running that fast.
Q. Would the brakeman ride the cars?
A. Sometimes, it is according to how many men was on the crew, and how lazy they were; often a man runs along and holds the lever

up, as often as he hangs on the corner; it depends on the man; sometimes a man will run along all day, and others will ride all day.

Q. Where was your last railroad service?

A. On the Rock Island.

Q. When was that?

A. I think it was last May, was a year ago, possibly.

Q. How long had you been in that service?

A. I don't just remember, but several months possibly; I believe I was there, if I am not mistaken, 15 or 16 or 18 months—something like that; I went to work in December—I think about 15 or 16 months.

Q. What were you doing before you went on the Rock
5058 Island?

A. I was with the Union Pacific, as yardmaster.

Q. How came you to quit the service of the Rock Island?

A. I got my hand mashed and bought out a grocery store.

Q. You have been in business in Argenta for some time?

A. I was in the grocery business until about eight or nine months ago, and then changed.

Q. When were you in the Iron Mountain service last?

A. In 1905, I think it was.

Q. Where did you go to when you quit that service?

A. To the Union Pacific.

Q. At what part of that line were you engaged?

A. For the Union Pacific?

Q. Yes?

A. At Rock Springs, Wyoming.

Q. How came you to quit the service of the Iron Mountain at that time?

A. Following a former official.

Redirect examination.

By Mr. HILL:

Q. You mean you went——

A. The trainmaster on the Valley went to the Union Pacific, and wrote for me to come out, and I followed him later, after he was there.

Witness excused.

5059 A. PAULETTE, being first duly sworn and examined, in rebuttal, testified as follows:

Direct examination.

By Mr. HILL:

Q. I wish you would please state your name, age, residence and present occupation?

A. A. Paulette, age 38, residence 610 East 14th St., Little Rock, on the police force at the present time.

Q. How much experience have you had in railroad service, and in what capacities, just state generally without going into details?
A. Figure it out since 1885.
Q. What kind of work have you done in that time?
A. In that time, I have fired an engine, I have broke as brakeman, worked as conductor, and switchman.
Q. Have you run on local and through trains on the Iron Mountain in Arkansas?
A. Yes, sir.
Q. How many years of service have you had?
A. About six or seven years as conductor.
5060 Q. About what years.
A. I was promoted in 1901.
Q. To freight conductor?
A. Yes, sir.
Q. How long did you run as freight conductor on the Iron Mountain?
A. Between five and six years, as an average.
Q. Did you serve in Arkansas since then, on any other road?
A. Yes, I worked for the Rock Island, as switchman.
Q. I want to call your attention particularly to the Iron Mountain?
A. That is where I shine on the Central Division.
Q. That is what you are familiar with?
A. I am more familiar with that than anything else, as far as road service is concerned.
Q. By the Central Division, you mean from Little Rock to Van Buren?
A. From Argenta to Van Buren.
Q. The railroads have put in an exhibit here, claiming that the local train stops eight times to once for the through train——
A. Eight times to the through train's once?
Q. What do you think of that; what is your experience about that? Before you take it up in detail, just answer whether you think that is correct?
5061 A. It is pretty near that, but that ain't all the through freights.
Q. I am talking about the average condition?
A. No, sir, it won't do it.
Q. Take some division you are familiar with, and state why you say that? Here is a station list, take that and explain the stops?
A. Of a through freight or local?
Q. I want both; take whichever is most convenient first, I want you to explain this, I don't want an extreme case either way.
A. You want the average?
Q. I want the general average conditions.
A. Just like an every day occurrence?
Q. Yes, just take that and show from that station list, the stops made, take the through train first?
A. I will make it six stops is an average on the through between Amboy and Russellville—that is Argenta, you might say; that is

not including the meeting of trains; that is just each train as you go along; you are not meeting any trains; now you have got passenger trains to contend with——

Q. Put in the meeting of trains; what would be the average stops for meeting trains?

A. You have got passenger trains to meet; you have got to stop and head in for passenger trains, and then there is your
5062 through freight that has rights over them; you have got to get out of the way of them; an east bound train has rights over the west bound.

Q. It would depend on the way you were going?

A. We are starting out of Argenta, on a through freight.

Q. You take a run out of Argenta, and call out the various stops and tell what they would be?

A. Preston for water, Gold Creek between there—either at Gold Creek or Preston for water; then at Point Remove—we call it Germantown—it is between Germantown and Point Remove.

Q. It is a water tank?

A. Yes, sir, we stop, not including the train orders in that distance, in that 75 miles, you will meet on an average about 5 or 6 or 7 trains which you have to stop for all of them going west.

Q. That will make about nine stops to Russellville?

A. It will make ten stops on a through freight.

Q. Go on from Russellville to the end of the division, to Van Buren?

A. You will stop again for water——

Q. Where?

A. Mill Creek, and you will stop for water at Clarksville, you will take coal at Coal Hill, and you will stop for water at Mulberry, and you will figure nine times out of ten, stopping for water at
5063 Ozark; there is your junction point in there on these detours—that is, a detour from Hartman around to Ozark; them junction points is just the same as a road crossing; there is a telegraph office at each end of that; there is two detours, you have got to make, two stops there in spite of everything—that is at these junction points, because you have got to stop around in that detour, to come to Spadra; that is one stop you have got to make, and you stop at Denning, and stop at Hartman, for that detour to Ozark, and when you get to Ozark get to the junction point, you have got to stop again, for there is your registering station, where you have to register, so you can know which is going over the old main line and which over the new main line——

Q. What is a registering station?

A. We register at all these junctions.

Q. Who registers?

A. The conductor.

Q. Has to stop his train and get out——

A. Yes, sir, he is not going to do it on the fly—I never did—you have to sign your name and the number of your train and engine and everything in that register.

Q. You have gotten to Ozark?

A. You stop at Mulberry for water; you have got to take
5064 water, and you are sure to meet trains between Ozark and Van Buren, and if you do, you have got to stop and head in.

Have you figured up how many stops you would make in that distance, on your usual run?

A. No, I have just been talking, I haven't figured the amount of stops.

Q. I can figure it from what you say; now, take a local—before you come to that, take the run the other way?

A. Coming east, there used to be a run called 92, that was a manifest run.

Q. That is the Red Ball you mean?

A. Yes.

Q. I want you to take an average run—would a Red Ball be an average run?

A. No, because they get the benefit over the rest of them. You take an extra out of Van Buren——

Q. Would that be an average run?

A. Yes, sir, you start east, stop at Mulberry always, stop and take water going east, and then you will stop again at Coal Hill, if you go the old way, or if you go the new way, you will stop at Denning for coal always; if you go around the detour, you will stop at Denning to take coal.

5065 Q. Do you have to make the same stops at junction points going east, as you do going west?

A. Yes, sir, you have got to figure to register at these places; you stop at Denning, Mulberry, junction and Denning—that is not meeting trains at all.

Q. Go on down the road from there?

A. Then you leave Denning, you go along, and you have got to take water at Clarksville; then you take water at Hartman, there is a tank just a little beyond, Hartman, I forget what they call that place, it is just east of Hartman about half a mile; then you go to Clarksville, and take water; then you will go right along the line, and if you haven't any meeting points you will go to Mill Creek and take water, and then you will go on to Russellville, stop there,—register station—you have got to stop all trains there at Russellville, regardless of what they are; you leave Russellville,—you can figure on Morrillton being a stop—not all the time on a through freight—they might give you the white board, let you go; you are bound to get meeting points in between these places; you are coming on an extra, the man going west, of course, you have rights over him; you meet another extra freight, he is going to take the siding, you will stop—you will stop every time you meet a train—I don't
5066 know how many you will meet on the road, but it is on an average six or seven or eight trains a day, and you have to stop for very near every one of them.

Q. Going east?

A. Going east, you have a right over everything.

Q. What about passenger trains?

A. You have got to head in for them.

Q. You haven't rights over passenger trains?

A. No, sir, you have rights over extra freights going west; the time card trains, you haven't any rights over, unless they give you orders to hold the main line, and meet so and so—meet No. 77—but you have to stop to meet this one always.

Q. Go on down to Morrillton,—that was the last one.

A. Germantown, you have to take water again; that is Point Remove,—we call that Germantown,—water tank—then you go on down between Point Remove and Gleason,—you take water at Gleason, that is at the foot of the hill—you go on to Gold Hill (Creek) you take water again,—you are not meeting any trains—you may meet three or four trains between Russellville and Gold Creek—it is according to what is running on the road,—on an average, you will meet two or three trains,—regular train, passenger trains, and freight trains—you will figure on five trains anyway, counting your passenger trains coming down.

5067 Q. Where was the last point you did mention?

A. Gold Creek.

Q. From Gold Creek into Argenta,—go on?

A. There is no regular stop for a through freight, unless it is a meeting point; it is according to what time you are on the road, and whether there is any regular train coming or not; it is only three or four miles from Gold Creek to Argenta; if you have a through freight train—if you are an extra, the chances are you are going right along, unless you meet some through trains.

Q. You have mentioned meeting trains, and I suppose that is a variable quantity, varying at different times; I wish you would give what would be your experience of an average run, what would be the number of trains you would meet on a through freight, that you would have to take a siding for, between here and Van Buren?

A. Going West, you will have to take the siding for through trains, say ten trains you have to take the siding for,—all of them; going east, you don't have to, for through trains when you are coming out of Van Buren to Little Rock—Argenta..

Q. How many would you have to take sidings for?

A. Make it an average, you will meet eight or nine trains

5068 a day.

Q. By meeting, I mean trains you would have to stop for?

A. You have got to stop for them—it is either to take the siding, or you have got to stop for them.

Q. There is another question I don't know about—I suppose you do—can you meet these trains at your water stops,—can that answer for the same thing, or are they separate stops?

A. There is not a water tank between Van Buren and Little Rock that you can meet a train and take water at the same time; for instance, you take Mulberry, you are meeting a train at Mulberry; the siding is about a train length west of the water tank; you have an order to meet a train at Mulberry; you stop at Mulberry and meet your train and then pull down to the water tank, and take your water;

The Ozark tank is before you get to the siding, and the Clarks-

ville tank is beyond the siding about half a mile; and Mill Creek the water is beyond the siding; you stop at Mill Creek, you have a meeting point, you have no more rights to go beyond this east siding to go to get water,—you have got to get water—you have no rights unless you protect yours along this road, you have to protect the other train—you are making two stops to meet this train.

5069 Q. Have you allowed in that estimate of stops, you have referred to train orders; how many train orders would you usually have to stop to get, between here and Van Buren, on a through freight?

A. You will make eight or ten stops—ten stops, for orders, on an average.

Q. That is, you get orders at ten stops?

A. Yes, sir.

Q. Will you always stop for orders, or will the orders come at your stops?

A. These are special stops for orders; you can go to work—you are going west with a freight train—there is lots of places you can get your orders and still meet your train; you will pull in between the switch in the clear, and still walk back and get your orders.

Q. That would be one stop for the two of them?

A. One stop will answer two purposes; say you had a meeting point at Atkins,—you drive up in the clear; you have to meet the other train; the board is out, you can go and get the orders while you are waiting; you are making one stop answer both purposes.

Q. Take the local run—I believe that is split between here and Van Buren.

A. Split at Russellville.

5070 Q. Take the local run between here and Russellville, and say how many stops you will make?

A. You stop at every station.

Q. You have a station list before you, just count them?

A. You will make twenty regular stops.

Q. Will you have more than that twenty?

A. Yes, sir.

Q. What would they be for?

A. Meeting trains, sawing them by, heading in and unloading your merchandise,—you have got to stop, spot your merchandise cars—your merchandise is always next to your caboose—you pull up, spot your merchandise cars, and if there is any switching to be done, you cut your engine off and go to do your switching—say you are forty minutes at a station, unloading merchandise and doing the switching——

Q. That is getting onto the switching proposition; we will take that up in another connection; what I want to call your attention to, is the regular stops you would make on the local train between here and Russellville?

A. You would make more than that; there is a stop at Gold Creek, for water, besides your regular stop. Gleason spur will be

5071 another one; that is 22, and the water tank at Point Remove would be 23; you can make it on an average to Russellville on the local,—there will be 30 stops.

Q. Take from Russellville to Van Buren, on your local?

Mr. MOORE:

Q. 30 stops does not include the meeting of trains; there would be thirty regular stops for water and stations?

A. You include everything, coal and water and everything else. Say you leave Russellville on a local, you have got to wait at Branch Junction, switch at the coal mine; Mill Creek, Cabin Creek, Clarksville and Spadra; we will take this run from Russellville to Van Buren, 24 stops—Mill Creek water tank is 25.

Q. Not including water, that is just your regular stations?

A. Mill Creek for water, and Clarksville for water—that is two, and either Hartman or Ozark, you can make one stop for either one or the other, and Mulberry, 24 stops, including the stops for water.

Q. Did you count your coal stop in there?

A. No, sir, that would be another one.

Q. Where would that be?

5072 A. Denning or Coal Hill, if you came around the old main line, or go around the detour, you will stop at Denning; there is not a man going either way, through Denning or Coal Hill, but what takes coal.

Q. That makes how many—about thirty?

A. Yes, sir.

Q. What about stopping and meeting trains?

A. You haven't met any then.

Q. Are those taken care of in these stops or are they extra stops?

A. They are all extra stops, because you can do your local work and all on the siding, and you have to take siding to meet these trains.

Q. Put it at whatever number you think would be the average amount?

A. Say you meet eight or nine trains, counting the passenger trains and all.

Q. That would make something like thirty or forty stops on the local?

A. Yes, sir, from Russellville to Van Buren.

Q. Coming this way, without taking it up in detail, would it be more or less than that?

A. It would be about the same; the only difference is, you would hold the main line instead of taking the siding and meeting trains.

5073 Q. Were you in the railroad service when they used the link and pin coupler and hand brakes?

A. Yes, sir.

Q. Were you in the service when they used automatic couplers and air brakes?

A. Before they were in it.

Q. Were you in the service afterwards?

A. Yes, sir.

Q. You are familiar with the handling of trains with both classes of equipment?

A. Yes, sir, I have handled them with part air and all air and no air at all.

Q. There is a question in this case about the damage to freight cars from stopping and starting, it is recognized that starting and stopping trains, is a cause of injury to freight cars, and there is an effort to find out how much that was.

A. In what class, in the old link and pin or what?

Q. I will get to that; where would be more damage to the car,—in which class of equipment, the old class or in the present class, from starting and stopping?

A. The old class.

Q. Why?

A. On account of more friction to the cars; you haven's got the power like you have now to stop them; you haven't got no
5074 air; the brakeman will get out and set the brakes and hold that train down; he cannot regulate his speed like a man will with air; the engineer has to pull his train up to the tank, and you have got your brakes set, and the minute he starts that train, releases it, you have the hind end tied down, and he is pulling against a solid block.

Q. You mean that causes more injury?

A. Yes, sir, say there is twenty cars in the train; out of that, you will have eight or nine brakes set with the hand brakes; when this man starts to pull up, he sees he is going to stop too quick, with the pressure he has on them cars and the draw bars ahead of them—there is that much more strain than there would be with air; if it was air, he would release the whole train and go right along.

Q. What is the difference in effect on the cars, the injuries to the cars, in switching in terminals,—that is recognized as an element of injury to cars,—what I want to know, based on your experience,—was there more injury under the old link and pin days or more under the present equipment?

A. More under the old days.

Q. Why?

A. Because them days the cars wasn't as strong as they are today, wasn't built as strong, and there was automatic couplers that
5075 they have now-a-days, that don't require as much hammering as they did before, because when you make your coupling with the link and pin, you set your pin in your links, and at that time, you hit them pretty hard, you have to, and now you don't have to; all you have to do is keep the knuckles open and they will make themselves.

Q. I believe you say you have been a freight conductor?

A. Yes, sir.

Q. Are you familiar with the method of making out wheel reports on the Iron Mountain?

A. I guess so; I have made out several of them; a few anyway—never got any of them returned to me either.

Q. There is this rule on the back of the wheel reports, I want to read you: "Cars must be reported in train order, commencing

with the caboose, to show the make-up of trains, leaving district terminals."

A. Yes, sir, leaving the terminals.

Q. Do you remember that order?

A. Yes, sir.

Q. Was it obeyed?

A. Yes, sir, I did.

Q. What in your judgment, was the usual rule of freight conductors in making up their wheel reports, did they make them up this way or not?

5076 A. They make it off your train book, just as you take the train from the caboose to the head-end.

Cross-examination.

By Mr. MOORE:

Q. What are you engaged in now?

A. I am on the police force of Little Rock; I was in this railroading up to the 17th of last month.

Q. Are you in night or day service?

A. Night service, I just went home and had my breakfast and came right down here, because I promised Mr. Hill to be here.

Q. Are you in the habit of drinking?

A. No, sir.

Q. Haven't you been drinking this morning?

A. I took one drink this morning before breakfast; I don't make it a habit or anything like that, but if I want one, I will go and get it; I don't think this has anything to do with this railroad business; we are not on duty at the present time,—I know I am not.

Q. How many stops does the through train make on the run between Argenta and Russellville?

5077 A. You mean meeting trains and all?

Q. Yes—first, without meeting trains?

A. If you leave out meeting trains, they only make their stops for water.

Q. How many stops do they make for water?

A. There will be Gold Creek, Germantown,—make three stops.

Q. Independent of meeting any trains?

A. Yes, sir, independent of everything; you have got to make them.

Q. How many stops does the local make between Argenta and Russellville?

A. She makes all the stations.

Q. How many?

A. You can count them out.

Q. Just count them; that is the question.

A. 23 stops without meeting a train.

Q. Does that include taking water?

A. Yes, sir, that includes water, don't include any coal, there is no coal to be taken between Argenta and Russellville; this is an average; I don't say they will make that many stops every day,—

you haven't met a train in that, and there is lost of trains running between Russellville and Argenta,—passenger trains especially.

5078 Q. If I understand your statement correctly, you say that there was more damage with the old link and pin equipment in starting, because there would be eight or nine brakes set?

A. On the rear end of your train, figuring on making your stop,—than with the air coupler; it is a solid chunk that you have got to pull against.

Q. And they will create a greater friction?

A. Yes, sir, because here you are,—you say you will have seven brakes set—you have got that many set—there is your train pulling against it; you are pulling against that; the engine to stop this train—the engineer seeing he is going to be too soon in making this stop, he opens up that engine to pull that train down to the water tank—what is he pulling against? He has seven or eight cars in a solid block; these other cars haven't got brakes set in them ahead of them; when he pulls that open, there is where it is hard to work; if he has air, handling the air himself, he releases this air; you haven't anything on the hind end to hold you; the whole train is released.

Q. Are you through now?

A. Yes.

Q. He is pulling against all these set brakes?

A. Yes, sir.

5079 CARL R. GRAY, recalled, testified in behalf of the complainant as follows:

Redirect examination.

By Col. MOORE:

Q. You testified that if a division of expenses of operating local and through trains were properly apportioned, that would not account for the extra cost of handling state over interstate freight: what are the elements of difference you had in mind?

Judge HILL: That is objected to as not proper at this stage of the case.

Col. MOORE:

Q. You stated on cross-examination that you would not regard the last half of 1907 as representative of the business for a period of years:

Will you explain in what respect you do not consider it representative.

A. I was covering in that particular answer the question of physical conditions, and my answer was intended to cover the

5080 physical conditions only.

Q. What physical conditions do you refer to?

A. The conditions to which I had already referred, in respect

to the distortion of any one month or any short period of time, on account of the difference between the actual movement of tonnage and the actual time in which it is taken into account.

Q. How would it be in regard to the earnings on state business under the state commission rates which were in force at that time? I mean as a representative period?

A. I would regard it as fairly representative in that respect.

Q. You think, then, so far as the expense of state freight is concerned, and the earnings under the rates then in force, it would be a representative period?

A. Yes, sir, that is my thought.

Q. Mr. Gray, was the automatic coupler used in the old cars?

A. The automatic coupler was placed in all the old cars in service at the time the law took effect.

Q. It has been stated in testimony in this case that the cars had been strengthened so as to require a greater power of resistance: how has it been with regard to the draft rigging?

Judge HILL: That is objected to.

Col. MOORE:

Q. Will you state what the opportunities of operating
5081 officials, including division superintendents, and thence on up to the general manager of a railroad, are for familiarizing themselves with operating conditions such as switching and other conditions of that kind, and the effect of such conditions upon the expense of equipment?

Judge HILL: That is objected to, and we also object to Mr. Gray testifying at all on any matter other than his cross-examination. If it is competent to testify upon at all, he should be recalled after the defendants close their case.

A. An operating official, commencing with the rank of trainmaster, is in constant touch with the operation of trains on the road, and the supervision of switching at terminals. The duties and his responsibilities compel him to ride the local freight trains as well as the through freight trains, and constantly supervise the work, determine upon its necessities, pass upon its practicability and in the last analysis decide the general manner in which the work shall be conducted.

This is equally true of the terminals where a great deal of his time must necessarily be spent in the field, with all the different engines and crews; determining the manner in which they shall work; supervising the character of their service and by a proper method of statistical inquiry keep constantly posted as to the relative cost of the different terminals, comparing the same; investi-
gating and finally passing upon the expense; and in every
5082 way directing all items of physical operation.

As he progresses his responsibilities are not lessened but his methods and avenues of information are correspondingly broadened.

It is not only his privilege, but it is his duty to keep constantly

in touch with every element that creates or affects expense, and he is of necessity the final arbiter as to the character and extent of any kind of work.

He must have, in order to be able to judge intelligently, a knowledge of all the operation of his line, or such portion of his line as he is in charge of. And that keeps him in touch with any changes in conditions which serve to affect either favorably or adversely the elements of cost.

Cross-examination.

By Judge HILL:

Q. Mr. Gray, I wish you would restate you opinion about October being a representative month: I do not quite catch your distinction there?

A. The distinction I make is that October was not a representative month to be used in the physical sense.

Q. What do you mean by "physical sense"?

A. In the application of physical statistics which are the ton miles. Because of the fact that there is so much business, so many of the ton miles, that are not taken into account—as I explained in my testimony.

Q. On your "lap-over" proposition?

5083 A. Yes, sir.

Q. That does not have anything to do with the physical conditions, as I understand it, does it?

A. The physical statistics, yes.

Q. Did I understand you to make some distinction as to physical movement?

A. The physical conditions which were found, in the way the matter was explained to me, as your arriving at the October statistics.

Q. Your whole testimony on that goes back to a still further attack on that "lap-over" proposition: that is all you mean by this, is it?

A. I do not know that I understand what you mean by "attack"?

Q. Criticism, if you prefer that word.

A. No, sir, the question was, as to what I meant by my answer.

Q. I am going back to your original answer, just what that meant.

Col. MOORE: Let Mr. Gray explain.

Judge HILL: That is what I am asking him to do.

A. My answer to the question on cross-examination, as to the month and the period not being representative, applies directly to the question of physical statistics, and my fundamental objection was that you cannot get into that period the physical conditions by taking one month.

5084 Q. That is because there would be lap-overs that would not take care of themselves from one month into the other month: that is your point?

A. Yes, sir.

Q. As I understood your answer a while ago, which is what I did

not get clearly, it was that it would be representative to measure the state freight under the commission tariff: is that what you said?

A. Yes, sir.

Q. How is that. I do not understand that.

A. For two reasons: First, because the state freight all being short haul is taken into the current month's business.

The period involved represented the high water business; and for that reason it was representative of the maximum of what could be earned by a railroad of state freight, on any basis of rates.

Q. In other words, you do not think the lap-overs would be as much on state freight as on interstate: is that your point?

A. Yes, sir.

Q. That is all there is to it?

A. I don't know anything about "that is all there is to it."

Q. I am asking you that.

A. As I understand it, that was the question.

Q. I did not understand your distinction and that is
5085 what I am trying to get. I want to know now if that is all the distinction you are making?

A. That is the distinction between the two.

Q. That would mean that the physical conditions would not have a proper relation to the revenue?

A. I don't believe I exactly understand what is meant by that question.

(Previous question read.)

A. No, sir, I would not say that.

Q. Is not that what your position would lead to?

A. No, sir. I believe that the revenue is more nearly representative than the application of physical conditions would be.

Q. Just what do you mean by that?

A. It is difficult to explain what I mean by that.

I have testified that the period, the last half of 1907, was not representative in its physical sense, with respect to a number of things:

First, the fact that the freight was delayed in that period, and would serve more to throw into one month the expense of handling business that was accounted for in another month. That is the distinction I make in the physical sense.

Now, the distinction I make as to the state traffic is, that it is a short haul traffic and is more nearly accounted for in any given period, either a month or six months' period; and in arriv-
5086 ing at a conclusion as to the earnings upon any basis, as applied to that particular period, I would regard it as fair and if anything leaning in liberality toward showing a greater earning on the state business.

Q. That is the one month proposition you are discussing or is it the six months?

A. The one month or six months. I am discussing the question of applying physical statistics in the one case to other periods, and I have stated my objection to it.

Then in reply to the question whether I thought it was a fair criterion upon the state business I have said I did.

One is a question of arriving at comparative value of statistics. The other is a question of determining whether it is fair to use a certain period to determine earnings.

Q. And you think it is fair for earnings and not fair for expense?

A. I do not think the two bear any relation to each other.

Q. You do not think that earnings and expenses bear any relation to each other?

A. I did not say that.

I do not think my answer is inconsistent where in the one case I criticised the physical statistics and in the other where I accept as fair a period for determining known quantities.

Q. And you regard the cost as a known quantity?

A. No, sir.

5087 I am referring to the earnings on state business as a known quantity.

Q. I got the proposition backward.

The substance of your views, as I gather it, is that the physical conditions correspond to the revenue in the state business but not in the interstate?

A. No, sir, I am not testifying in that way.

Q. Is not that the result of your statement there?

A. No, sir, I do not see that that conclusion can be drawn.

The question I was asked was, whether I considered this period a fairly representative period for determining the earnings from state traffic; and my answer was that I did and if it leans in any direction it would be toward liberality in determining state earnings. And I gave as my reason for that the fact that the state earnings being short haul, and being mostly on one line, are almost invariably taken into the current month's earnings.

Q. It is a little bit of a digression here, but I will call your attention to the fact that a pretty large per cent, 12% or 15% or something like that, of the interstate business on the Iron Mountain road out of Fort Smith and Memphis has as short a haul as the interstate business.

Col. MOORE: You are mistaken about that. It is very much larger.

5088 Judge HILL: From Memphis it is somewhat larger than the other state business but not nearly so long a haul as the interstate. There is evidence here to show that that condition is true of Fort Smith. It happens that we have some furniture factories there and while the haul is not nearly so long as the interstate haul it is much longer than the average state haul.

A. I have not during any part of my testimony referred to specific conditions, because I am not familiar with them on the Iron Mountain road.

Judge HILL: You are not familiar with the Iron Mountain conditions, are you, Mr. Gray?

A. I have based my testimony on the figures which were given me as to the average haul of state and interstate business.

Q. The facts are undisputed as I have stated them to you, as I understand the proof. I cannot recall just the figure but I know I am stating them correctly, generally.

You are not familiar with conditions on the Iron Mountain road?

A. Only as I understand the conditions to be generally on that road in common with all southwestern roads.

Q. You have not performed any service on the Iron Mountain?

A. None whatever.

Q. You do not know the Iron Mauntain road any better than any other competing line in your territory?

A. No, sir.

Q. You never have studied the statistics of the Iron Mountain?

A. Only as presented me in this case.

5089 H. R. V. ROSING, recalled, testified as follows:

Redirect examination.

By Col. MOORE:

Q. Will you state the number of freight cars in service on the Iron Mountain Railroad, and the cost of equipping freight cars with air brakes, including the cost of the brake and putting it in place on the car?

A. The Iron Mountain Railroad has between 19,500 and 20,000 freight cars. The number of cars varies from day to day but it will not be less than 19,500 nor more than 20,000. The cost of equipping a car with air brakes is about eighty-five dollars, which includes the cost of the air brake equipment, complete, as purchased from the manufacturer, and its application, with the necessary connections to the car.

Recross-examination.

By Judge HILL:

Q. Mr. Rosing, did not you and Mr. Roberts agree that the cost of an air brake was $40.

A. That is the cost of the air brake parts as we got them from the manufacturer.

Q. You agreed on that?

A. Yes, sir, but that did not include its application to the car and the levers in connection with it.

Q. You are speaking now about the labor and other things?

5090 A. Yes, sir, and the appliances necessary to put the thing in the car in an operative condition.

5091 Mr. F. P. JOHNSON, recalled, testified as follows:

Cross-examination.

By Mr. HILL:

Q. Mr. Johnson, at page 884 of your testimony, speaking of maintenance of way expense you say it seems to you it is more of a general expense than any other item of the operating department: What do you mean by "operating department" in that connection?

A. By that I mean the entire operating expenses of the railroad. Perhaps, the words "operating department" are not just quite right; but, taking the five classes of operating expenses——

Q. What are those five classes?

A. Maintenance of way; maintenance of equipment; traffic; transportation; and general expenses.

By that I mean that the maintenance of way and structures is just as much an overhead expense as any other item of the expense in that class.

5092 Q. Under maintenance of way, maintenance of eqipment, traffic and general expenses?

A. Yes, sir.

Q. I just want to get your difinition of the term "operating expenses" in that connection.

I believe those five classifications are the ones that are used in these exhibits?

A. Yes, sir.

Q. Is that the term to which you apply the designation "primary accounts"?

A. Yes, sir, those are the primary accounts as designated by the Interstate Commerce Commission.

Q. The reason you give for tnat. as I understand it, is because, the expense that is incurred this month is not taken into the account this month or next month or possibly not this year, and the traffic or the car movement has no bearing upon the amount of money which is taken into maintenance of way expense in the month in which the car movement is made.

That is your reason for reaching that opinion, as I take it?

A. Yes, sir, those are among the reasons.

Q. The fact that all of that expense is not current is not peculiar to the maintenance of way expense?

A. Well, I think it is more so than it is in any other department of the railroad expenses.

Q. There might be a question of degree, but that same proposition runs into a great many other accounts?

5093 A. It does, yes, sir.

Q. Take maintenance of equipment and a very material part of that expense is not current, is it?

A. Yes, sir, I should say a large part of it is not current.

Q. I don't suppose you have any figures on it, but you know that a very material part of it is not current, do you not?

A. Not so much so as in maintenance of way.

Now, in saying that, I have this in mind: that there was a time in the handling of the accounts of the Missouri Pacific Railroad when we would separate the repairs of equipment between what we call "ordinary repairs" and "accident repairs." Those accident repairs as a rule were of very recent occurrence and it was a large part of the maintenance of equipment expense.

Q. But you do not do that now?

A. No, sir, we have not followed that plan since 1904.

Q. Under your present system there would be a very material part of the repair account which would not be current?

A. There would be the same proportion perhaps that occurred prior to 1904, when we had those figures separated.

Q. It would be more than that, I should take it; and in your maintenance of equipment you have to allow off a certain amount for depreciation, and all above that would be current?

A. I am afraid you do not understand what I mean by that:

5094 "Ordinary repairs" were repairs that were made in ordinary course of business; repairs to the cars and the locomotives, themselves.

And "accident repairs" were abnormal repairs, due to wrecks or accidents on the road. And those were of recent occurrence.

Q. I caught your distinction. But under the present accounting system you have to allow a certain percentage, under the Interstate Commerce Commission rule, for depreciation, don't you?

A. Yes, sir.

Q. How much do you allow?

A. It is 2½%, 3% and 4%; but I do not remember to what class of equipment these different percentages apply.

Q. I am not particular about the exact distribution but it is a small percentage?

A. Yes, sir, a small percentage.

Q. And a small amount?

A. Yes, sir, and a small amount.

Q. The wear and tear on equipment above that small percentage would not be current, would it? Cars wear out in the course of time, and all that sort of thing?

A. The ordinary wear and tear would perhaps be a large percentage.

Q. And that is not current any more than maintenance of way, is it?

A. No, sir.

5095 Q. Now take "traffic": is that current?

A. I should say a very large part of the traffic expense is a current expense, because it is practically all salaries.

Q. There is a part of that which would not be current, isn't there?

A. It may come under the head of stationery and printing and possibly advertising.

Q. Advertising is what I had in mind. What have you in that account—if you have it before you.

Col. MOORE: Let him finish his answer.

A. I was going to say that the advertising expense would not be more than 90 days old, because they would not let us run much longer than that.

Q. What is that?

A. It is newspaper advertising and printing bills.

Q. What I have in mind is, you have a large printing bill—I do not know how often but I do not suppose you would have that every month. You advertise the industries along the line, and all that sort of thing. Those would not be current expenses, but would run through the year?

A. No, sir, they are paid within sixty days and charged to operating expenses as paid.

Q. I understand that. But you would not have sixty days' worth of literature published at one time, would you?

A. The pamphlets, of course, we get out and we pay for them as they are printed. But we use them perhaps all that season.

5096 Q. All that year or more?

A. Yes, sir.

Q. That is the point I am making.

A. Yes, but even that is a comparatively small part of the trame expenses.

Q. I know that, but I wanted to call your attention to the fact that there would be an item there, of more or less moment, that would not represent the current expense?

A. Oh, yes. Of course, that runs through all of the operating expenses but not nearly so much as in maintenance of way and structures.

Q. Now, take "transportation": take your casualties; I believe that comes under transportation, does it not?

A. Yes, sir, casualties come under transportation.

Q. That is heavier?

A. It is a large item in itself.

Q. There is very little of that which is current?

A. Very little.

Q. I assume there are other transportation items that are not current. Do you recall any? Say "loss and damage": do you include that as casualty?

A. We understand that "casualty" includes loss and damage to stock, injuries to persons and to stock on right-of-way.

Q. I know you have sub-divisions.

A. I have just given you the sub-divisions. Damage to

5097 stock is, of course, a current expense.

Q. I do not agree with you about that.

A. Except such claims as are in litigation.

Q. I would have to disagree with you on that, Mr. Johnson. Unless you can qualify yourself as a claim agent.

A. I have handled those claims for perhaps fifteen years.

Q. You do not mean that stock killed in October are paid for in October?

A. I mean perhaps 90% of it is paid before the end of the November accounts.

Q. It would not be current if you take any one month or a certain period?

A. If you take six months, yes.

Q. There would be the question of "lap-overs"?

A. It would be a lap-over of July and December, yes, sir.

Q. But there is no such thing as current expenses in damage to stock. You may be prompt in your payments, and I hope you are.

A. We are compelled to be in Arkansas.

Q. In the ordinary course, when you are prompt, it would be thirty to sixty days before settlement was made?

A. I would call that a prompt settlement.

Q. I am not criticising the promptness of your settlement, but I am just getting at the course of business.

A. What I have in mind is, that there is a big difference between settling claims in sixty or ninety days, and paying an expense incurred six to seven years prior.

5098 Q. Why, certainly.

A. You must bear in mind that between fifty and sixty per cent of all the operating expenses on a railroad are for salaries, which are current items.

Q. What other items do you think of right now, without going too much into detail, that are not current, beside transportation?

A. You will find it in exhibit 3, if you have that before you.

Q. At page 889 (that is Mr. Wright's statement in regard to switching) you take two runs between Little Rock and Texarkana and between Little Rock and Hoxie, and show the actual time consumed by a local and by a through train:: you say you drew off the running time between Little Rock and Texarkana of a through train between those points, during the month of October, 1907, for each of the 31 days; and that the average running time of the through train was 16 hours and seven minutes and the average running time of the local train was 25 hours and 18 minutes:

How did you get at that, Mr. Johnson?

A. We had our man in charge of the wheel reports take the wheel reports themselves and take off the running time of those trains for each day in that month.

Q. And then average them?

A. Yes, sir, and then average them.

Q. Your local train there was composed of two trains, was it not?

A. Yes, sir.

5099 Q. Where were the respective runs of those two trains?

A. They break part of the time at Arkadelphia and part of the time at Malvern. We did that in order to cover the same territory that was covered by the through train.

Q. I understand that. That would make the average of each of those local runs about 12½ hours?

A. Well, that would depend upon the length of each of those runs.

Q. I said "average": Have you the actual figures of the separate runs? If so, I will put them in?

A. No, sir, I think Mr. Hamilton has that work sheet. I gave it to him the other day.

Q. I have not the work sheet but I knew from the physical situation that would necessarily be done.

A. What I mean is if the run from Little Rock to Arkadelphia was longer than the run from Arkadelphia to Texarkana, each of those runs would not average one-half of the total. You see what I mean?

Q. Yes, but I assume that break is made practically half way. That would be the usual practice.

A. The mere fact that they changed the run of those two locals would indicate there is some difference in the mileage. That change I think was made upon the 12th of that month.

Q. That would not be important to the question I want to get at. The average would be twelve hours whether one was a local and the other was a through train.

5100 A. The average between the two local runs would be.

Q. For the purpose of our inquiry it would not make any difference whether one was longer and the other shorter; the average would be that.

Take the distance between Arkadelphia and Little Rock: how much is it?

A. I have not that mileage.

Q. Haven't you a time-card there that would give it? Isn't it sixty-five miles from Little Rock to Arkadelphia?

A. Yes, sir.

Q. What would be the running time of that local train from Little Rock to Arkadelphia? How much of that 12½ hours would it consume? My recollection is that the testimony indicates that the speed is 20 miles an hour for average speed.

A. On the basis of 20 miles an hour it would be 3½ hours or 3¼ hours.

Q. What I am talking about is the run between stations?

A. Yes, sir, and the testimony in the case as to that running time.

Q. That would leave how much time of that 12½ hours?

A. It would leave 9¼ hours.

Q. Take your 9¼ hours and I think the evidence is that the switching is usually about five miles an hour. If you spend all that 9¼ hours switching how would that be?

A. Oh, I——

Q. You know, as a matter of fact, all of that time could

5101 not be spent in switching. You know that not only from your own observation but from what you have heard about the delays to the local train, waiting for orders, lay-outs, spotting cars, unloading merchandise and so on?

A. Yes, sir.

Q. You know that probably a large proportion of that 9¼ hours would not be spent in switching?

A. I would not say how much. Part of it would be spent in duties other than switching.

Q. And you know, without going into the figures, that it would be a large part?

A. Yes, sir.

Q. Now, take the next run there from Arkadelphia to Texarkana.

Col. MOORE: It would be variable, depending upon the conditions of traffic from day to day?

A. Yes, sir.

Judge HILL: Take the other run and make a similar calculation —the run from Arkadelphia down to Texarkana.

A. The distance is eighty miles and at twenty miles an hour the running time would be four hours; and that would leave eight and one-half hours. If all of that was employed in switching it would leave forty-two miles for switching.

Q. And you know a material part of that would have to be reduced for causes other than switching?

A. Yes, sir.

Q. Make your calculation on the basis you have made it,
5102 comparing your through with your local—sixteen hours against the twenty-five hours?

A. Those two local trains from Little Rock to Texarkana are making eighteen hours in switching service, according to this calculation.

Q. No, sir, according to your calculation here they are making nine hours. I am assuming that the local and through time on the road is the same. I think that is the testimony in the case?

A. You have a distance there of 145 miles for those two local trains at twenty miles an hour they consume seven hours in running time; that leaves eighteen hours for switching.

Q. Yes, that is breaking them up into two locals. But here is the point: The through train has made that run in sixteen hours. I understand from the testimony in this case—the testimony in behalf of the railroad at least, that the through train does not do any switching and that represents its running time. And I understand from the testimony in the case that aside from the stops of the local trains that it runs as fast or faster on the road than the through train. You so understand that?

A. Yes, sir.

Q. If it takes the through train sixteen hours to make its run from Little Rock to Texarkana, and takes the local train sixteen hours to make its run, exclusive of stops for switching and other purposes, that is nine hours excess, is it not?

A. Yes, sir.

5103 Q. That nine hours at five miles an hour would represent forty-five miles, if all that time was consumed in switching?

A. Yes, sir.

Q. And that forty-five miles would be what per cent of the 145 miles?

A. That would be about 30%.

All I intended to do was to explain that I did not give this illustration to show the amount of switching performed by a local train.

The testimony in this case that was presented by the state, by more than one witness, stated that the difference between the schedule time of trains was an indication of the amount of time that was put in by that local train in switching.

Now, I do not believe that the schedule time has anything to do with it. If the time of the trains is any indication of the amount of switching, it ought to be compared with the actual running time.

Q. I have accepted your basis and am making the comparison on your basis.

A. What I mean is, that I have not stated in my testimony that the timecard is any indication of the amount of time consumed in switching.

Q. If you recall the testimony put in by Mr. Wright, he simply stated it was the opinion of the men on the road that that
5104 would be the time consumed in switching, comparing the local and the through train?

A. I do not believe the time card has anything to do with it.

Q. I do not believe Mr. Wright said it had, but he said that the opinion of the men who got out the time-cards had something to do with it. But that is a matter of evidence. That other would run out practically the same way, wouldn't it?

A. Yes, sir.

Q. I will not take the time to make the calculation.

Turn to your testimony at page 892. You say that your traffic expenses are apportioned between states on the basis of the gross earnings and not the train mileage; and you quote from page four of the state's exhibit:

"The amount apportioned to the state of Arkansas is based on the revenue train mileage in that state as compared with the revenue train mileage on the whole road"

and you call attention to an apparent discrepancy there:

I wish you would turn to your exhibit and see if it is not a fact that the state has used your revenue figures:

I will state by way of explanation, that that is a typographical error in the state's exhibit, in copying it. Mr. Kimbell and you differed as to that basis of division. Your figures were made up according to your way and Mr. Kimbell's figures were made up according to his way. In copying the state's exhibit the typewriter copied the one figure when the other figure should have
5105 been used.

A. That is a typographical error in your exhibit.

Q. There is no error in the figures.

A. No, sir, there is an error in the reading matter in the exhibit.

Q. The reading matter in your exhibit is true as applied to the Cotton Belt?

A. Yes, sir.

Q. But the figures in the state's exhibit are correct?

A. The figures are correct.

Q. You are not questioning that?

A. No, sir, I am merely questioning the statement in the exhibit.

Q. Some of these copies have the figures and statements correct and some have not. It was simply an error in copying.

A. That is all I intended to call attention to—that the reading matter itself was wrong.

Q. But the figures are right?

A. Yes, sir.

Q. And use your basis as you claim it should be?

A. Yes, sir.

Q. At page 890-*a* here is Mr. Moore's question:

"Q. Mr. Hillman testified that the cost of yard service should be ascertained directly as between state and interstate on the basis of the tons instead of dividing that item between local and through trains."

Then he asked you what effect upon the result in the figures produced by the state here would such a division as that have, if divided in the manner suggested by that witness. And then you answered that in amounts.

5106 Did you understand Mr. Hillman's testimony that he said it should be ascertained directly between state and interstate, instead of dividing that item between local and through trains?

A. Yes, sir. My understanding of Mr. Hillman's testimony is that he would not divide that expense between local and through trains but divide it direct between state and interstate, either on a car basis or a ton basis.

Q. I will call your attention to the testimony of Mr. Hillman appearing at pages, 1566, 1567, 1576, 1577 and at pages 1609 to 1611 inclusive, which are as follows:

"Q. Now, Mr. Hillman, I wish you would take up this "Maintenance of equipment"; that seems to be the proposition that our friends on the other side are criticising very much. I would be very glad to have you go through that with some detail.

A. On this "Maintenance of equipment" I find that the accountants for the state have first taken the expenses and divided them between yard, local trains and through trains.

This method of handling it altogether, with their percentages which they have added to each of those, is, to be a little trite, a "new one on us."

I had made the division of those accounts recognizing the switching but dividing the switching in the freight on the basis of the handling, counting it on the tons.

I had divided the rest of the expenses which are the road expenses, on the basis of the ton miles. I was anxious to see how that would pan out here and with the information I have, I ran that up. I find they charge on this basis to intra, in the neighborhood of $76,000 for those "maintenance of equipment" items, included in locomotives and car repairs.

In my basis it amounts to a trifle over $73,000.

Q. A difference of how much?

A. A difference of $3,000, or approximately 5%, between the two methods.

Q. Our accountants were——

A. Your accountants' figures were higher than those that I would have placed had I been making the division.

I was very anxious to see how this would come out, as it struck me that they had allowed very liberally for the extra expense
5107 incurred by the damage done by yard locomotives to the equipment in the switching process. They have made a further allowance for extra switching done by locomotives on local trains, amounting to 75%. This is quite heavy, and in my opinion, it is a very liberal allowance to this factor.

Q. It is in evidence here that they attempted to take the maximum on all of these allowances that are shown in this head, and I will ask you if in your judgment that is true, that they were high enough to be the maximum for these various items?

A. Yes, sir, I should say they are. I would further say that I have considered in the matter of allowing the switching, in my own division, upon the ton basis, that I was giving an allowance to the contentions of the railway companies, and I have always felt in doing that that I wanted to place my figures beyond criticism and have therefore made that allowance on the ton basis. In doing so, of course, we ignore to a great extent the fact of switching of interstate tons at terminals, in making that division, but I think it is the best factor that we can get, unless we absolutely take the cars and their loading, which are switched at a terminal, and then apply that switching over the average length of haul, the ton mile basis, which would be almost an impossible work to pick out after you have gone over an account. It could be kept at the time."

And on pages 1576 and 1577:

"Q. The next item is yard and terminal expenses, divided between local and through business on the basis of the number of cars handled at terminals; are you familiar with that method and that factor of reaching that item of expense?

A. Yes, sir, I have not always gone into that detail. I am doing it now in one case that I have on hand, but I have not always gone into that detail where I have not had that factor; I have divided that, as I stated before, upon the ton basis.

Q. Which is the nearest factor, in your judgment?

A. The handling of cars at terminal stations, switching at stations, is undoubtedly the factor to be taken into consideration.

Q. When you cannot get that, you take the next best, as you have in some instances?

A. It really is not necessary to go into that much detail.

Q. The next item here is fuel and expenses; that matter was handled in this way, on the Iron Mountain; they took the fuel that was ascertained by a test made by the Cotton Belt Railroad, and the gentleman who had been general manager of both railroads, said that the fuel conditions should be practically the same upon those, and they have applied the factors obtained in the Cotton

Belt test to the Iron Mountain in the absence of any data
5108 from which they could get the actual fuel consumption. What is your opinion of the proper way to divide that expense, or the way it has been divided?

A. The way that it has been divided seems to us to be proper. Of course, it depends to a certain extent, upon whether the conditions between the two roads were on an equality; if there is testimony to that effect on file, it should receive its confirmation, as far as that test only goes to confirm it.

Q. If you were confronted with a statement made by a witness introduced by the carriers, who had been general manager of both of the railroads in controversy, that that was a fact, would you feel justified in using his figures?

Question objected to and not pressed.

A. I would say further, that in the absence of the testimony of the character of which I have spoken, I have taken that consumption of fuel on the straight engine mile basis, as between the local and the through trains; I mean by that, when I have not that percentage available I have taken it on the straight engine mile basis."

And on pages 1609, 1610, 1611:

"Q. I believe you stated this morning you used tons as a basis of dividing yard expenses between state and interstate; would it not be better to use that unit there, than to make the division between local and through trains on the car mile basis, and then divide between state and interstate on the ton mile basis, wouldn't it be a more direct way of arriving at the result?

A. I would not like to say that it would be the better way of doing it; it is a method I have pursued heretofore myself, in handling those expenses.

Q. I take it you pursued the method you thought the best?

A. I pursued it because my attention had not been called to this method of handling; I think I stated when I went over it, that it was a new one to me, that it received attention from me as to how it bears out, and it looks very fair on the face of it.

Q. Assuming if your plan is the proper plan, wouldn't it be better to divide the car expenses, I mean the expenses on the basis of the cars, between state and interstate, rather than to divide it between local and through trains, and then on the basis of ton miles between state and interstate, as far as it could be done?

A. I think that the absolute car basis of the handling of the cars would be the best, and if my recollection serves me, that is the way the accountants for the state have taken it up.

Q. If you will turn to page 4 of Exhibit K, you will find that the yard and terminal expense is divided between local and through business on the basis of the number of cars handled at terminals,
that assumes, as I understand it, a division between local
5109 and through trains, that is the way it is divided between local and through trains; after that is done, then this expense is divided between state and interstate business on the ton mile

basis. Now, what I want to ask you is, what is the use—is there any good reason for dividing that expense between state and interstate business upon a ton mile basis, where it is practicable, in so far as it is practical to divide it on the basis of the cars in which the freight is handled?

A. Offhand, without, as I have stated, going into this matter further, as I wish to do, I should say that I would prefer to accrue the switching cost upon the cars at the terminal, and after that amount of money had been determined, I would, then, of course, distribute it by the ton mile basis to state and interstate, as that would be the factor, or you might say, not the factor, but the term in which I would express costs. I would not base the costs on the ton mile, but after I had the cost of this ton and all other expenses, I would then express that in a cost per ton mile.

Q. You would make your division on the car basis?

A. Yes, sir, I think I would, as I see it now, without going further and comparing it further, I think I should fasten it on the car or ton.

Q. The state's accountants, in the exhibits in this case, have divided a large part of the train expenses of the expenses, I mean of trains—on the car mile basis, and in doing that, the car is a car without regard to its contents, whether it is empty or loaded; if it is loaded, without regard to the weight of the load. Now, what is your view as to the proper method of dividing that character of expense between freight and passenger cars?

A. That is, the expense of switching?

Q. Yes, the maintenance of way and structures and equipment, all that sort of thing, I am speaking now of these large divisions, maintenance of way and structures, maintenance of equipment, and that character of expense which is divided on a car mile basis as between local and through trains; what in your judgment would be the better way of dividing that between passenger and freight—I speak of the car itself?

A. The car mile or the car basis, and terminal car basis, as set up here, and dividing it by the ton mile would not enter into the division between freight and passenger."

Q. Mr. Johnson, is this the testimony you had in mind in using this basis and in making your Exhibit 56?

A. Yes, sir, so far as the division of yard and terminal expense is concerned, and particularly his testimony at pages 1609
5110 and 1610.

Q. You also used that on the basis of Mr. Hillman's testimony in making your division of repair to yard engines in your exhibit 56, in paragraph 1-*a*?

A. I did not make that division in the repairs to yard locomotives on account of any testimony that Mr. Hillman gave on that particular account. I think in my testimony I merely referred to what Mr. Hillman testified to as to what he would do in dividing his yard and terminal expenses. Now, then, the repairs to yard locomotives is an entirely different item.

Q. You made it on the same basis?

A. Yes, sir.

Q. My question was, were you doing it with Mr. Hillman as your support for so doing?

A. No, sir.

Q. At page 1566 of Mr. Hillman's testimony there is one paragraph where he stated:

"I had made the division of those accounts recognizing the switching but dividing the switching in the freight on the basis of the handling, counting it on the tons. I had divided the rest of the expenses which are the road expenses, on the basis of the ton miles."

Then he states further: that making his division that way and comparing it with the division made by the state on some items, there is only $3,000 difference between his division and that of the state.

If I understand your exhibit 56 you use Mr. Hillman's basis for the tons for switching but do not use his basis for the ton
5111 miles for the remainder of the expenses in making that division: isn't that true?

A. By "remainder of the expenses" you mean yard and terminal expenses?

Q. My question is, what Mr. Hillman was referring to.

A. Exhibit 56 was not made up on the basis of any testimony that Mr. Hillman gave, to the exclusion of the testimony of every other witness.

I merely called attention to what Mr. Hillman said in regard to this particular item. There were other witnesses who testified that the yard and terminal expenses should be divided on the basis of tons handled rather than between local and through trains on the basis of the number of cars.

Q. You referred in your testimony to which I am now directing your attention, to Mr. Hillman as your authority. And I am now calling your attention to the fact that you accept Mr. Hillman as authority on the tons in the yard and terminal service but do not accept Mr. Hillman as authority on the balance of that same account; and I ask you if that is not a fact?

A. I would not put it that way. I have not used Mr. Hillman as an authority for anything.

Q. Mr. Moore's question here, as I understand it, implies that (page 890). Your answer was that you thought that was correct.

A. I do not see any connection with that in stating that I thought Mr. Hillman was correct. Mr. Moore asked me what the
5112 effect of applying Mr. Hillman's basis to the figures would be and I told him.

Q. And that is the basis you used on the tons, but you did not follow Mr. Hillman when he used ton miles on the balance of the expenses in that account?

A. No, sir, I followed in the balance of the account quite a number of other witnesses.

Q. While we are on that point of handling cars in terminals and repairs of yard locomotives, on the tons instead of the car basis, you would necessarily assume there that the haul of intrastate freight

of 72 miles would occasion the same handling as the haul of 218 miles of through freight, wouldn't you?

A. Yes, sir. This basis assumes that a ton of state freight with an average haul of 70 miles receives the same service as a ton of interstate or trans-state freight with a haul of 218 miles.

Q. When you take those tons you derive your statistics from your exhibit 26, do you not?

A. Yes, sir, that would be from Exhibit 26, the month of October, 1907.

Q. Then your figures based on that would have this vice of the lap-overs in it, would it not?

A. Yes, sir, just the same as any other calculation made on the month of October would have it.

Q. And all the horrible results that would follow from that lap-over feature would run into your exhibit as well as in the state exhibits?

5113 A. Yes, sir, this exhibit is built on the same plan as the state's exhibit, changing the arbitraries and changing the factors for division.

Q. Is not the state exhibit also based on the wheel report, while your exhibit is based on the auditor's report?

A. Yes, sir.

Q. The state's exhibit would be freer from the lap-overs than yours, according to the testimony which has been given here, would it not?

A. So far as the car mile basis is concerned, of course there would be no lap-overs.

Q. But according to the basis you used there would be?

A. On the tons there would be lap-overs.

Q. And according to the state's plan there would not be any in this item?

A. No, sir, so far as the actual percentages are concerned, based on car mileage.

Q. On page 893 under the heading of "Other train expenses" you criticise the use of the train mile as a factor to divide those other train expenses: I will ask you if the state had used the car mile basis there, instead of the train mile, if it would not have been much more favorable to the state? And I will call your attention to Exhibit I on page 1 where you will find (leaving out the fractions) that if the car mile basis had been used there the result would have been fifteen, whereas by using the train miles it is twenty-six against the local train?

5114 A. Yes, sir, the percentage of train miles is larger than the percentage of car mile.

Q. The use by the state of the train mile in that instance operated to the advantage ultimately of the interstate expenses, did it not?

A. So far as those two bases are concerned, yes.

Q. At page 893 you state:

"And so far as the greater part of the damage to stock, wrecks, injuries to persons, are concerned, that expense could have been

located either to the local train or the through train with the same degree of exactness as the loss and damage to freight was."

How are you going to locate stock killed, to the local train?

A. The stock claims that are presented will show the point of damage, the train number and class, as well as the names of all the trainmen on that train. There are cases where stock is killed by an unknown train.

Q. A great part of the stock killed at night, they do not know by what train it was killed?

A. I would not say that, because the train crew itself makes report when it kills or damages stock.

Q. We know as a matter of common knowledge that a great deal of stock is killed at night, where the train crew does not know who killed or damaged the stock; is not that a fact?

A. It depends on what you call "a great amount."

Q. I know only what I learn about it in the law courts.

A. It is so definitely known that we used to divide it be-
5115 tween freight and passenger trains.

Q. You do not do that now?

A. No, sir.

Q. Suppose you had a head-end collision between a local train and a through train, how are you going to divide and locate that?

A. How am I going to do it?

Q. You said you could locate it between the local and the through train?

A. I said we could locate a large part of the expense of damage to stock and a large part of the injuries to persons.

Q. As a matter of fact is not that more of a train expense than a car expense?

A. What?

Q. Killing stock and injuring people: it is done by the train as an entity and not by the individual car: is not that the logic of it?

A. That is true. But I do not believe the train mileage is the proper basis to divide the expense between the two classes of expense, when you are trying to get the cost of state and interstate.

Q. Isn't it a fact that the mileage is better than any other factor, where a certain amount of injury takes place in the operation of a railroad?

A. I can answer that better by saying that neither the car mile nor the train mile would take care of loss and damage in transit.

5116 Q. But the train mile is evidently a more logical unit to use there than the car mile, is it not?

A. Yes, sir, than the car mile.

Q. Now, speaking of those injuries there: those are all questions of lap-overs, but we have discussed that.

At page 894 you say, in discussing the allocation of expense in the state's exhibit of wages paid to train crews and you say that was taken from your time books; and then occurs this statement:

"The only difference between that method and an exact amount would be the question of overtime on the last two or three days of each month that might not get into our time books."

Wouldn't it be pretty bad bookkeeping if you did not have all your wages both straight time and overtime, properly charged to each month?

A. That is a mistake there on the question of overtime.

What I should have said is, that the exact amount would be the question of the time for the last two or three days of each month.

Q. Even taking it that way, would not that be bad bookkeeping if you did not have the October time in your October accounts? It might be on account of an accident or sickness that a man's time was not sent in, but when it did come in would it not be properly charged to October?

A. No, sir.

Q. It would not?

5117 A. No, sir. And I should say there are a great number of runs on the Iron Mountain and the Missouri Pacific where the last day and possibly the last two days are carried over into the next month, because we do not get the time slips.

Q. You do not get those before you close your October accounts?

A. No, sir, we do not get those before we close our payrolls.

Q. I am speaking of October?

A. Yes, sir.

Q. Isn't it a fact that in this case—and did not you and Mr. Hamilton go through that and in a few instances, perhaps some half dozen instances, where you did not have an engineer's time or the fireman's time, you took the time of the other one and made the calculation so as to make that correctly. You took either the engineer's time or the conductor's time?

A. I do not know what Mr. Hamilton did to adjust that, but I do know that in going over those time books, we found a number of cases where the last two days of the train crew were not carried into the October account and that there were always one or two days in September carried forward into that October account.

Q. Don't you know those lap-overs to October were adjusted in that October exhibit for the state?

A. No, sir, I do not know that.

5118 Q. On page 894, Mr. Johnson, in discussing the principle of charging general expenses when the proportion of expense has been ascertained, you say:

"I do not believe the amount of money that is expended in the operation of a railroad say for expenses in the transportation department has anything to do with the cost of operating our general offices."

Have you not reversed the proposition there, Mr. Johnson? The question of spreading into transportation the expense of general offices, and not the other way?

A. No, sir, I don't believe I have. Your exhibit divides the total general expenses between local trains and through trains on the basis of the cost ascertained for each of those classes of trains in the other general accounts. I don't believe that is the proper way to do it.

Q. I understand that. But have you stated that proposition cor-

rectly there? You stated it, as I understand it, that the transportation expense would be put into the general expenses: you do not mean that?

A. No, sir, I do not. I say "the amount of money that is expended in the operation of a railroad, say for expenses in the transportation department has nothing to do with the cost of operating our general offices or has nothing to do with the general expenses."

Q. According to this method of dividing it, no part of the operating expenses go into the general expenses, do they? That is, no part of the transportation expenses?

A. No, sir.

5119 Q. Part of the general expenses go into the transportation?

A. I do not understand that either.

There are five classes of operating expenses; "general expenses" is one of those five classes; "transportation expenses" is another class. They are independent of each other.

Q. Certainly. But this answer (indicating record) would seem to leave the impression—or it did on my mind—that you are objecting to putting any operating expenses into general expenses: you did not mean that?

A. No, sir, but I am objecting to your plan of dividing general expenses in the exact proportion of the transportation expenses.

Q. You do not think any part of the president's salary should go into transportation expenses, or that any part of it applies to transportation?

A. It applies to transportation in a very general way, and I do not think you ought to divide the president's salary between local trains and through trains upon exactly the same percentages you found obtained in these transportation expenses because he has too many other duties to perform that do not depend upon the movement of trains.

Q. It just bears its proper proportion, does it not?

A. Its proper proportion to what?

Q. Its proper proportion to the other expenses?

A. I do not see just exactly what you mean by that.

What I mean is this: the trainmaster himself is employed

5120 in the operating of trains exclusively, as he is operating both local and through trains. Now, you have divided that. That together with other expenses in the transportation department, all added together, form a percentage and you have used that percentage upon which to divide the president's salary as betwen local and through trains.

Q. Don't you think the president has some duty with regard to running local and through trains?

A. Oh, yes. But I do not think his salary should be divided in the same proportion as the other actual operating officials' salaries and expenses are divided.

Q. Does not the Legal Department have duties reaching to every department of the railroad business?

A. Yes, sir.

Q. Maintenance of way, maintenance of equipment, transportation, traffic and everything else?

A. Yes, sir, and to the revenue as well.

Q. The Legal Department is very general, isn't it?

A. Yes, sir.

Q. Your Claims Department runs into every branch of business, does it not?

A. What do you mean by that?

Q. Don't you have claims that are handled by that department, growing out of Maintenance of way, maintenance of equipment, out of traffic and so on?

A. Yes, sir, but by no means in equal proportions.

5121 Q. Have you any way of finding out what proportion the claim department works, how much of it is in one department and how much in another?

A. Why, certainly. The claims themselves are charged to different accounts. For instance, there is a personal injury account in each one of these three primary accounts.

Q. The Claim Department has charge of all of it and runs it into each of the various branches and apportion- it according to where the claim arises—in which particular branch it arises?

A. To the department upon which the responsibility for incurring that expense rests. But not in equal proportions.

The claims in the maintenance of way, for instance, are very small as compared with other departments.

Q. There could not be any distribution of this that would really reflect the actual conditions, I take it. Suppose a passenger was injured on account of a defective rail: where would that claim go?

A. If a passenger on a train was injured on account of a defective rail, it would be charged to the transportation department.

Q. The maintenance of way department caused that injury yet it would be handled in the claims department through the transportation department?

A. I don't know whether maintenance of way caused that injury. We have had testimony here that shows that the

5122 Transportation Department injures the way and structures to a large extent.

Q. But it goes to a large proportion to defects in maintenance of way such as low joints, weakness of bridges and so on?

A. Yes, sir, and the expense of pounding on that track goes into another account.

Q. You criticise the state's plan of utilizing the October percentages by making them conform to the six months percentages in making up their exhibits: isn't it a fact that in these statistics the traffic expenses for six months are used instead of the month of October?

A. Yes, sir, the traffic expenses are divided between state and interstate on the basis of the gross earnings for six months.

Q. And station expenses the same way, aren't they?

A. Yes, sir, the station expenses are divided on six months' time.

Q. The only adjustment, as you referred to it in your testimony,

of the percentages of October to conform to the six months, is the ton mile, isn't it?

A. The ton miles that are used as the basis for dividing the local train and through train expenses.

Q. You referred generally to "Adjusting", as you call it, the percentages: did that refer only to ton miles?

A. It is just paragraph seven of your Exhibit K.

5123 Q. I think that is correct, but I think your testimony was a little broader than you intended to make it.

If they had not adjusted the ton miles to the six months period they would have had a constructive mileage in there instead of an actual mileage, would they not?

A. They would be no worse off than they are in either basis, they have used the six months' ton mileage on one month's percents.

Q. They have adjusted the ton miles to conform to the actual ton miles, instead of applying it on six months; instead of having a lot constructive mileage there that would not be actual?

A. They have done this: they have adjusted the six months' mileage to conform to the statistics of October, without taking into consideration any change that might have occurred and a change of one or two percent might have made a material change in that percentage.

Q. But if they had not done that they might have had a lot of constructive mileage in there. They would not have represented the actual conditions during the six months, would they?

A. I don't know, nor does anyone else.

Q. It would not be the same percentage?

A. No, sir, it would be 28.51% instead of 26%.

Q. And that difference of percentage would have represented a constructive mileage if they had not adjusted it to the

5124 actual ton miles, wouldn't it?

A. No, sir, it would not have represented a constructive mileage but it would have represented the proportions of state and interstate freight in October, 1907.

In November, 1907, that proportion may run thirty and seventy; or may run twenty-five and seventy-five. I do not see that the total ton miles for the six months would have anything to do with that October percentage.

Q. If they seek to make October representative of the entire six months' period they would necessarily have to take the six months' ton mileage to do so?

A. That is what they have done.

Q. I say if they assume October is representative of that entire six months' period, they would have to do that?

A. They have done that. They have assumed that the proportions ascertained in October, 1907, were exactly the same on local and through trains for the entire six months as they were for the month of October.

Q. And if October, 1907, fairly represents that six months' period, that was a fair way to do it?

A. I don't think so.

Q. You see from that, it is the theory upon which they proceeded?
A. I know that is their theory.
Q. You disagree with the theory, but what I want to get here is, that you are not disagreeing with the figures but with their theory?
A. It is the theory they adopt which I criticise.
5125 Q. Your testimony would rather leave the impression you disagree with their method of calculation. I want to make clear it is their theory of using the figures of October instead of for the six months that you are objecting to: is that correct?
A. Yes, sir.
5126 Q. On page 899, you criticise the division of "Miscellaneous" revenue, between state and interstate.
In your exhibit I understood you took the position that that could not be divided, so you just cut it out; cut out the property and the percentage representing that?
A. Yes, and the expense.
Q. What is that?
A. The expense as well as the property.
Q. The same proportion for the expense and for the property?
A. Yes, sir.
Q. You treated that like you did "mail and express"?
A. Yes, sir.
Q. Upon the State's plan of dividing the expense it was necessary for them to find some basis to divide that revenue, was it not?
A. Upon the State's method of ascertaining the cost of state and interstate freight you had to divide "Miscellaneous" earnings upon some arbitrary basis in order to take care of all of the operating expenses.
Q. By "arbitrary" you mean something other than actual, whether a proper factor or not; that would be a matter of discussion. They had to take some factor to divide that in order to get the expense that necessarily went into every account?
A. Yes, and an arbitrary factor, at that.
5127 Q. It was divided on the revenue basis, dividing revenue by revenue, and as I understand you, the revenue basis would be an arbitrary one?
A. For that purpose, yes.
Q. According to your basis, then, it would cost just as much to collect this $55,000 of Miscellaneous Rent as it would to earn a dollar in the first place, would it not?
You have an item of $55,000 "Miscellaneous Rents": according to your theory it would cost just as much to collect that $55,000, dollar for dollar, as it would to earn a dollar in the freight business?
A. No, sir.
Q. Why?
A. Because by adding to the percentage of extra cost of state freight, you have reduced the cost of your miscellaneous earnings.
Q. But your distribution is made before you add your arbitrary to the cost?
A. No, sir.
Q. It is not? You add your extra cost before you distribute?

A. Certainly.

Q. It would cost, then, as much to collect a dollar in through freight business, mail or express, as it would to collect these rents?

A. I think you have that mixed. Not as through freight and mail and express. They are entirely two different things.
5128 It would cost just as much to collect a dollar of these rents, as it would to earn a dollar of interstate freight; or, in the case of passenger, as it would to earn a dollar in interstate passenger.

Q. Or a dollar in mail?

A. Or a dollar in "mail" or "express".

Q. That is your method?

A. That is the result of our method. I would like to make that as plain as I can, too. That so far as the passenger business is concerned, these "miscellaneous" earnings are merged with our "mail" and "express" earnings, and we assume that it costs just as much to earn a dollar in "mail and express" as it does in the "miscellaneous" earnings, as compared with the State's method of making this profit as against "mail and express".

Q. On page 901 you say (referring to "mail and express" traffic):

"If the state is attempting to adopt bases that will come nearest to reflecting the actual expenses, then the revenue basis, which includes over 19% of mail and express earnings, is not the proper basis on which to divide this $53,000."

Are you not rather going back on the revenue basis, Mr. Johnson?

A. You are speaking now of "traffic expenses"?

Q. Yes.

A. My idea about that is this: that you are attempting, or the state is attempting to get at an actual basis that will reflect
5129 the cost of earning a dollar, in each class of service and as between local and through trains, state and interstate business. I do not believe that they have any right, when they are dividing the "traffic" expenses upon a revenue basis to include the "mail and express" earnings in that, and in saying that I do not believe we are discrediting our own exhibits in any way.

Q. I infer from that, that you do not think "traffic expenses" ought to be distributed over "mail and express"?

A. I don't think so if you are going to undertake to separate each item of expense. I do not believe, in the first place, that you can separate each item, but if you can obtain any basis that will do it, why, then, you have adopted the wrong basis in dividing your "traffic" expenses.

Q. I believe you have testified heretofore that you think the intrastate business ought to bear its revenue proportion of that "traffic" expense?

A. Yes, in connection with all other operating expenses, when you divide it on a revenue basis, because I believe that this is the only basis you can adopt for all of these accounts.

Q. I want to call your attention to the testimony of Mr. Ward, on page 685:

"Quite a number of witnesses (I cannot recall them all) have testified that it was proper on the theory that these agencies build up the country and induced the business into the country, and that

any agency which would tend to build up the country and build up the traffic on the road generally, would indirectly redound to the benefit of the intrastate traffic. I believe that this is about the theory upon which the state is charged with a proportion of that expense. If that theory is true should not the mail and ex-
5130 press also be charged with a proportion of it on the same theory?

A. It seems to me the point is a very small one. I would not personally think very much of the expense should be charged to the intrastate business.

Q. That is the position we took, but this gentleman converted us to the proposition of "laying up treasures in heaven"—or Arkansas—and we felt that on that theory they should be charged with their proper proportion.

A. That is true, in a general way; but I think it is a pretty fine point.

Q. I think so. But if you are going to accept that fine point, you should apply it to mail and express as well as to intrastate t[illegible] don't you think so?

A. Yes, sir, it seems to me so."

Do you agree with that view of Mr. Ward?

A. No, sir; I believe this, Judge: I don't think that Mr. Ward was thoroughly familiar with the items of expense that entered into this traffic account. I feel sure that there is not a part that is charged to "traffic" expenses, that was incurred by the railroad in the earning of its "mail and express" revenue.

Q. Mr. Johnson, don't you think that a general manager of a railroad is familiar with all of the details of operation, and of all parts of the railroad that is under his jurisdiction?

A. Yes, sir.

Q. Don't you think Mr. Ward is thoroughly familiar with all parts of a railroad?

A. No, I don't believe that Mr. Ward is familiar with the amount of money that is charged to each individual expense account. I think he has too many other duties to perform.

Q. You think you and our switchman and master me-
5131 chanic at Little Rock, are in accord?

A. That is not a fair view to take of it. The testimony in this case shows that in the first place, these accounts are not strictly Interstate Commerce accounts, and if Mr. Ward is operating the Burlington Railroad (as I know he is) on the basis of the Interstate Commerce classification, then he could not be familiar with them.

Q. You had some criticism of the train auditor's expense on passenger trains; you say that ought to be taken out of "general expense" and charged up to the passenger transportation, I believe: is not that the way you did it in your exhibit?

A. We have the train auditor's expense in our general expenses. Now, then, for the purpose of this exhibit, I think the state should have taken the train auditor's expense out of "general expenses" and divided that upon a different basis from the balance of the "general

expense," because in the first place, this is not a "general expense" item.

Q. That is what I want to talk about. You carried it in your books as a "general expense" item in 1907?

A. We used to, prior to July 1, 1907.

Q. And the Interstate Commerce Commission made a change?

A. Yes. The reason we did that was because our train auditors are entirely under the supervision of the General Auditor of the railroad company, and he felt that it ought to go in with the rest of his expenses.

Q. And you carried it that way: it was the judgment of
5132 your Company—up until the time the Interstate Commerce Commission required it to be otherwise—to put those items in "General Expense?"

A. Yes, sir.

Q. And your exhibits in this case carried them in "General Expense?"

A. Yes, sir.

Q. What are the duties of the passenger train auditors?

A. To collect the tickets and the cash fares on the train.

Q. He has no regular run, has he?

A. His runs are changed about every six weeks or two months.

Q. He is just sent from one part of the system to the other, is he not?

A. Just on part of it, every six weeks or two months.

Q. Then you haven't auditors for every run?

A. We had auditors for every run on the Iron Mountain in 1907, I think up to some time in December, when they were reduced. I may be mistaken about that, but we tried to cover every run.

Q. I do not know the dates, but I think I can state this, that you will probably agree with: when you first put on train auditors you put them on every run, did you not; when that system first went into vogue you attempted to put them on every run?

5133 A. Yes, on the Iron Mountain.

Q. And then you got to discontinuing runs and cutting down your force and transferring them from one run to another?

A. Our policy has always been to transfer them periodically, but we did not undertake to reduce any of them until the depression in December, 1907. As a matter of fact, our policy has been to constantly increase them, and on the Missouri Pacific——

Q. Is that expense pooled with the Missouri Pacific expense?

A. The train auditor's salary and expense is divided between states in exactly the same way that the conductor's salary is; it is divided on the mileage of his actual run.

Q. What I want to know is whether you treat the Iron Mountain and the Missouri Pacific as one, in your train auditors' expense?

A. No. We haven't a joint run, in the first place, but if we did have a run from a point in Kansas, on the Missouri Pacific, to a point in Oklahoma, on the Iron Mountain, we would divide that particular expense on the mileage of those two roads. But we haven't any joint run.

Q. Take an auditor running between Little Rock and Fort Smith; his run would be for six weeks. The next time he is liable to be transferred to run from Sedalia to Kansas City—on the Missouri Pacific?

A. Yes, sir.

Q. But you keep track of his mileage made in Arkansas?

5134 A. Yes, sir, we keep track of that.

Q. You interchange him from the Missouri Pacific to the Iron Mountain, as you please?

A. That is not a regular thing. What I mean is, we do not interchange them every day. It is not a daily occurrence.

Q. Every six weeks? You have some fixed period?

A. We will leave a man on a run say for six weeks or two months.

Q. And that other run is just as apt to be on the Missouri Pacific as it is on the Iron Mountain?

A. It is apt to be.

Q. More apt to be than not?

A. No.

Q. You want to take the fellow away from where he generally runs, don't you?

A. Our ordinary plan would be to run him in the other direction. For instance, if he was running from Little Rock to Texarkana, when the time came to change him, we would run him from Little Rock to Fort Smith or to Alexandria. His headquarters would be in Little Rock.

Q. Don't you use these men in your auditor's office for work there, when they are in town, or detail them for any work in the auditor's office?

A. When we detail them for work in the auditor's office they are no longer train auditors.

Q. You use them there, do you not?

A. As clerks.

5135 Q. I don't know what you call them, but they are on duty in the general auditor's office?

A. We have four or five men in the general auditor's office, whom we treat as extra men, and send them wherever we need them.

Q. And they do clerical work in the auditor's office when they are not on the run?

A. Yes, sir.

Q. If a man would come in from a run and you were shorthanded, you would put him to work in the auditor's office?

A. No, there are very few men who come in off their run. They never come up to St. Louis unless they are coming up for a rest of a week.

Q. Haven't you five or six men there now?

A. Yes, but they are extra men, these five or six.

They may be in Kansas for one week; they may be in Arkansas for the next week, and they may not go out again for three weeks.

Q. In the meantime they are in the auditor's office performing work there?

A. In connection with the train auditor's accounts, turning in the train audits.

Q. They are really collecting agents for the auditor?

A. They are what?

Q. They are really collecting agents for the auditor; collecting revenue and tickets for the auditor, and bring them directly into the auditor's office?

5136 A. You mean the train auditor in general?

Q. Yes.

A. To the same extent that a conductor used to collect tickets and cash before we had train auditors.

Q. That was when the conductor had the two services to perform?

A. Yes, sir.

Q. Now the conductor has no services to perform in regard to the collection of revenue, collection of tickets, when there is an auditor on the train?

A. No, sir.

Q. These auditors have no control over the train at all?

A. Not a bit.

Q. They cannot give orders to the conductor in any way, I understand, as to the management and control of his train?

A. Not so far as the train is concerned.

Q. Mr. Johnson, you put in a lot of figures here on the effect of the court tariff; the effect of railroad rates and commission rates, at page 911 or 912, I believe it is:

The object of that, as I understand you, is to show that an increase of revenue does not necessarily mean the same increase of rates?

A. That is the object of exhibit number 54. That is the exhibit, I believe, that refers to it.

Q. All the material part of this exhibit is in your testimony?

A. Yes, sir.

Col. MOORE:

Q. The testimony explains the purposes of the exhibit?

5137 A. Yes, sir.

Judge HILL:

Q. You did not make any calculations of the corresponding increase of revenue and rates on your interstate business during the periods that you were making the calculations for the intrastate, did you?

A. No, that was impossible for the reason already stated, that we could not apply the old rates to the interstate business on account of the volume of business involved.

Q. Then these figures showing the rate increase and showing the revenue increase, would have no bearing at all as to the relation between state and interstate, either in rates or revenue, would they?

A. These figures would not make any comparison between state and interstate business, either revenue, or rates or volume.

Q. If you were looking into these figures to throw light on the relation between state and interstate, and whether there was an in-

crease in rate or an increase in revenue, these figures would be valueless?

A. These figures are compiled for the purpose of showing that it is impossible to say that when the gross revenue, or rather, when the average revenue per ton per mile for two different periods would show a difference of 96 per cent, that that 96 per cent does not indicate a 96 per cent increase in the rate. That is all these figures were compiled for.

Q. One rate? I mean, one rate as against the interstate rate; or against the state rate?

5138 A. No, the 96 per cent we have had quoted to us was the increase in the average revenue per ton per mile, on state business in one period as against another.

Q. It was used in this connection, if you recall; an average of 96 per cent on state, as against an average increase of 9 per cent on interstate business, for the same period.

A. Yes, sir.

Q. You have no light, in these various statistics you have put in on these different tariffs, of the corresponding increase or decrease, as the case may be, in the interstate rate, while these changes were taking place?

A. We couldn't give you that. It is impossible to get it for the interstate business. We have it for the state because we worked it up currently during all of these months, at a large expense, because we were practically compelled to.

Q. But the problem that we were putting to you and to Mr. Kimbell, involving the 9 per cent increase in the interstate revenue and 96 per cent in the intrastate revenue, as indicative of the relation between state and interstate, hasn't any light thrown upon it in these figures that you have put in on this matter?

A. It has to this extent: that we know from compiling these figures that the 96 per cent is wrong.

Q. You know it is wrong as indicative that the rates were

5139 increased 96 per cent?

A. Yes, sir.

Q. You do not mean that Mr. Kimbell's figures are wrong.

A. No, I know his figures are right, but the 96 per cent is not the increase in the rate.

Q. I understand your position, but the great and primary object of that you haven't thrown any light on, that relation we have been trying so hard to find out?

A. We would like to know what that relation is just as well as you do, but we can't get it. We have this as a matter of record and gave you all that we have.

Q. Have you gone into it enough to know whether if there was 9 per cent increase on the Cotton Belt, what would likely be approximately correct on the Iron Mountain, for the same period?

A. We haven't done anything like that. It would mean our working up another exhibit 26 for January 1909, or one month's business.

Q. That is the only way we can get this relation between state

and interstate, by working up your interstate business and setting it up with state business, for the same period?

A. Yes, and applying to the interstate business the rates that were in force during the period in question, just as we did this state business.

Col. MOORE:

Q. I want to ask you, Mr. Johnson, in that connection, if the result of this exhibit in regard to state business (which I
5140 understand shows that the 96 per cent increase in the revenue per ton per mile does not represent the increase in rates) does not inferentially show that the 9 per cent you refer to in the interstate business would not reflect the increase in rates, or the change of rates—whatever it may have been—in that class of business; whether in that way it does not inferentially show that in neither case, the state or interstate, can you take the increase in revenue, per ton, per mile, as indicating the increase in rates?

A. I think this exhibit shows that that is not the proper way to get at the increase in rates, whether it be state or interstate.

Col. MOORE: That is what I want to know.

A. The principle itself is wrong.

Judge HILL:

Q. Just what principle is it that you say is wrong?

A. The plan that was adopted of taking the average revenue per ton per mile, in January, 1909, and comparing that with the average revenue per ton per mile for the six months ending December 31, 1907, and saying that the percentage of increase in 1909 over 1907 represented the percentage of increase in the rates that were in force in January, 1909.

Q. I don't know that anybody has advocated that theory.

A. That is my understanding of the exhibit that Mr. Kimbell was asked to put in on that basis.

5141 Q. We are digging after the relation between state and interstate and of course, incidentally, to know how much you had increased your rates, but I think you will see that questions put to Mr. Kimbell and all the other witnesses, recognize the fact that the revenue is a varying quantity and a very varying quantity, and we have been discussing that now from the viewpoint that that revenue represents the rates; that we are assuming it represents the rates.

A. You assumed that the rates had been increased 96 per cent on state business and 9 per cent on interstate business, by that exhibit?

Q. We assumed that the revenue had been increased and that a large part of that increase was on account of the increase in rates; that the relative increase in the two rates would be represented by a relative increase in the revenue.

A. I don't understand that it would.

Q. There is nothing in these calculations or statistics here to show it would not?

A. Not so far as the relation between state and interstate is concerned.

Q. That is the only matter we have been interested in particularly, and you haven't thrown any light on that interesting problem in these statistics?

A. Not so far as that particular question is concerned.

5142 NOTE.—It having been discovered that an error was made in the figures in Exhibit 56, growing out of a mistake of the accountant, those figures will have to be revised as soon as it can be ascertained, and correct figures substituted; and a certain part of F. P. Johnson's Exhibit 56, based on those figures, will also have to be corrected.

Recross-examination of F. P. JOHNSON continued as follows:

By Judge HILL:

Q. Mr. Johnson, as page 910 you speak of the car miles in Exhibit I including the hauling of company material. As I understand your statement you do not claim there are any company tonnage statistics included in Exhibit I, based on company material?

A. No, sir, in Exhibit I there are some averages shown at the bottom of the exhibit showing the average loading per car; and that is based upon the ton miles and the car miles as shown in this exhibit. The car miles included cars loaded with company material, the tonnage of which is not included in the ton mileage figures.

Q. Is not that the proper way to make up these statistics?

A. No, sir, I wouldn't say so.

Q. That is the usual way of doing it?

A. No, sir. The railroad undertakes to show the average loading per car mile. They would include their company material
5143 with their revenue freight.

Q. The company material does not enter into the revenue at all, does it?

A. Not at all, but it does enter into the average loading.

Q. Look at Exhibit I and you will see that they give statistics both ways.

A. (After examining exhibit.) That is all right. But the average number of tons of revenue freight considering loaded cars only, includes the cars that are loaded with company material. Now, then, the ton miles that form the other part of that calculation does not include the ton miles of company material.

Q. The only importance of this matter to which I am calling your attention is that the tonnage is not included in that, and the accountants have used car miles including the car miles made for the company material like the empty car?

A. Yes, and the only effect that has is upon that particular evidence.

In other words, the average loading per car on local trains considering local freight is not twelve tons.

Q. Fourteen tons?

A. Twelve in one case and fourteen in the other.

Q. You said "considering revenue freight": you mean company freight?

A. I mean revenue freight you have on this exhibit.

5144 That freight does not load on an average twelve tons or fourteen tons per car, because in that car mileage you have included only the revenue freight; and the car mileage includes the company material. And the same is true on the through train.

Q. That is a matter which runs into both of them?

A. Yes, sir.

Q. It is merely a question of whether you should include company material in making up the car mileage or not?

A. That is it.

Q. It seems the doctors of accountancy have disagreed again. You and Mr. Wharton have had a difference about Judge Farrington's opinion.

In your exhibit 55, which is your application of Judge Farrington's formula to the statistics in this case, I will ask you this: if the total freight transportation expenses were $1,755,255.76 and the average cost of all business is .0026721 per ton per mile, then by multiplying this cost by three you get the cost of state business, and by leaving the interstate business at .0026721, do you not increase the total transportation expenses beyond $1,755,255.76?

A. Yes, sir.

Q. Under this method, if the Interstate takes all transportation expense above the amount apportioned to the state, would not that result in charging the state with considerably more than three times as much per ton per mile?

5145 A. In making up this exhibit 55, I adopted the plan Judge Farrington adopted. I am not contending his plan is right any more than I am contending that Mr. Wharton's plan is right.

Q. What I am talking about now is the mathematics of it.

A. In the first case the figure .0026721 does not represent the average cost per ton per mile of all freight.

The ton mileage is 660,000,000 ton miles, and that brings about an average cost of .0026588.

Under Judge Farrington's method that extra cost should be increased by multiplying it by 100.5, or it should be increased .5 and that is your .0026721.

If I might explain, my idea about Exhibit 55 is that in applying Judge Farrington's formula, hire of equipment was not included in transportation expenses and that is what makes the difference.

Q. And you have put that hire of equipment in there?

A. Yes, sir. The Interstate Commerce Commission prior to July 1, 1907, included hire of equipment in transportation expenses.

Q. They did not in October, 1907?

A. No, sir.

And applying it to the statistics of this case, hire of equipment would not be included?

A. I don't know. I don't know what Judge Farrington would apply it to in October, 1907.

5146 Q. I am not talking about Judge Farrington but I am talking about the classification as it stands in this case.

A. The expense of the hire of equipment is still borne by the railroads, but it is not charged to the operating expenses.

Q. That is the point. The point of difference between you and Mr. Wharton is, as I take it, that you put the hire of equipment there and he took it as it stood?

A. He took our transportation account as it stood.

Q. In this case?

A. Yes, sir.

Q. And you changed it to conform to the later ruling of the Interstate Commerce Commission?

A. To the classification in force prior to July, 1907, when Judge Farrington's formula was applied to transportation expenses.

Q. Is not your mathematical calculation also made on a different basis?

A. A different basis from what? From Mr. Wharton's exhibit?

Q. Yes.

A. Yes, sir.

Q. Where does that difference come in?

A. In Exhibit G-1 which is worked out on the basis that the cost of state freight is three times as much as the cost of interstate.

Q. You worked it out yourself on the basis of 3½ times?

5147 A. No, sir, not three and one-half times. I worked it out on the basis that Judge Farrington laid down.

Q. I am not speaking about what Judge Farrington did, but I am speaking of the mathematical result.

A. The final result is 3½ times.

Q. That makes a difference of about $50,000, in rough numbers, charged to state freight, does it not?

A. Yes, sir. But I still want to make it plain that I was trying to follow Judge Farrington's formula.

Q. I started my question on the theory that the doctors of accountancy had disagreed about it and I was trying to get at the mathematics of the disagreement.

I believe you stated one of your objections to the method adopted by the state in making this calculation was that by the change of these percentages you could make radically different changes—that it was susceptible of great variation: is that your objection?

A. This general formula adopted by the state, yes.

Q. Your revenue basis, of 100%, is liable to some slight variation too, isn't it?

A. You mean the arbitrary application of either 50%, 100% or 150%?

Q. Yes, or 200% or 250% I believe some of the witnesses have run to.

A. Of course, the application of any two of those percentages would make a difference in the result.

5148 Q. A mighty wide range in working out results there, isn't it?

A. I don't think it has the same application to these statements as the state's basis does, because you can find perhaps a dozen different

bases for each individual item of expense, and an argument for each of them.

Q. It appears in this case, an argument against each of them.

A. Yes, sir, and an argument against each of them.

Q. Here is another point of variance, if you make estimates on the revenue basis, based on revenue or based on ton miles:

I notice some of the witnesses made their estimates based on ton miles and others made their estimates based on the revenue. And that results in considerable variance with men holding the same views, in so far as they use different factors, does it not?

A. There have been no different factors used by the railroad witnesses in this case.

Q. I am not speaking of the different factors but the different views.

A. There have been——

Q. Some of the witnesses say they estimate the extra cost at so much per ton mile and others state so much on the revenue theory. I think about five times on the ton mile and two and one-half times on the revenue has been a favorite way of expressing it. Rev-
5149 enue and ton miles are not in proportion to each other just one-half?

A. There is not very much difference on the Iron Mountain figures.

Q. They are close to that but they vary on the Cotton Belt?

A. Yes, sir, I think a little more than that on the Cotton Belt and a little less than that on the Iron Mountain.

Q. There is another varying factor, the factor used in forming an opinion?

A. I think so far as the Iron Mountain is concerned the opinion based on four times as much on the ton mile and two times as much on the revenue, would not bring about very much difference in the result.

Q. Not very much but applying these same figures to the Cotton Belt it would make some difference?

A. Some difference, yes.

Q. You stated (I do not recall the page of the record) that in the mileage in checking coach miles there was a discrepancy between you and the state accountants: they had 651,000 and you made it 685,000: you remember that item, do you not?

A. Yes, sir, 751,000 the state has and we have 785,000.

Q. You know how that difference came, don't you?

A. It is made up of the difference in actual miles in individual trains. It is made up of a number of different items. This
5150 makes a difference of two and one-half percent.

Q. My understanding of the difference is the difference in floor space of the mail and baggage cars?

A. That is a part of it and then there is some difference in the actual mileage of the different trains run and the cars in the train.

Q. Take a car used for mail and express both and I understand the state has taken it half and half?

A. Yes, sir.

Q. You have taken your government contracts as giving the floor space, haven't you?

A. No, sir, we took the memorandum the state got from the express company showing the actual amount of space in the car on each run.

Q. You got it from the express company?

A. The state got it from the express company and gave it to us.

Q. The floor space the express company is entitled to?

A. The statement says "the amount of floor space used."

Q. I thought that was all based on the contract?

A. Oh, no, sir.

Q. If it was mail, express and baggage all in one car the state would divide it one-third to each, and you attempted to take the actual amount of space used by each?

A. Yes, sir. And then there were some differences in the
5151 mileage of the individual run that made up the balance of it.

We had our car accountants check over the entire passenger car mileage for that month and I do not suppose any two men could check out work of that kind and come out exactly alike.

Q. I suppose not. I suppose there were errors both on your side and on theirs and possibly on both. That is about your idea?

A. Yes, sir, that is my idea of it.

Q. The main difference is using one-half or one-third, as the case may be, I presume?

A. Yes, sir.

Q. In your exhibit 56, in correcting what you said in your testimony you thought was an error of the state, is not allowing proper mileage for the passengers carried in Pullman coaches, you put in figures there in round numbers for the month of October of 12,000,000 passenger miles, of which 2,188,000 was in Pullmans.

It is a matter understood since we began this examination that an error has been discovered in that and I wish you would state just what you know about that.

A. The matter has just been called to our attention and we found in working up the number of passenger miles carried in Pullman cars that the clerks who made the report have duplicated a part of the passenger car mileage.

Q. You mean Pullman car mileage?

5152 A. Yes, Pullman car mileage; the passenger miles in Pullman cars. The conductor or train auditor in making his report, will report the entire mileage of the passengers in his Pullman cars. And frequently a train auditor will be changed on that run, and the new train auditor in making up his statement will also include the entire mileage of those passengers. That results in the duplication of some of the passenger miles.

We are arranging to take it now and correct it.

Q. We have not gone into it far enough yet to know the scope of the error?

A. No, sir, not yet.

NOTE.—It is agreed between counsel that the investigation which has been begun and is now under way to ascertain the extent of this error shall be continued by the state accountants and the company accountants and correct figures arrived at; and leave is granted to the complainants to revise that part of Exhibit 56 which is affected by this mistake. That the taking of testimony will not be affected by this but by this agreement the corrected statement will be filed later.

And, further, the railroad company has generously offered to bear the expense of this correction.

5153 Q. Mr. Johnson, I want to call attention to an exhibit filed by Mr. Roth (who I understand is sick and cannot answer any questions on cross-examination about it) and ask you if you are familiar with it?

A. No, sir, I am not.

Q. Have you examined it at all?

A. No, sir, only as it was filed here.

Q. I see a great many conclusions he has drawn here. For instance, he will say group 5 represents lower grade commodities carried in heavy loads with little, if any risk from loss and damage and consists of lumber and other forest products, salt, brick, lime and cement.

I have no way of finding out, unless some of you gentlemen can inform me, how that is made up and how he draws his conclusion.

A. Those groups are made up from a number of different commodities. I do not know what commodities were included in each group. As I have said, he made that up himself and I have no idea how he arrived at the different groups.

5154 T. A. HAMILTON, recalled, testified in sur-rebuttal as follows:

Redirect examination.

By Judge HILL:

Q. Mr. Hamilton, you put in evidence Exhibit C-1, which is a chart showing and illustrating certain rates, state and interstate, on the line of road south of Little Rock. Mr. Perkins, in discussing that at page 24 said, after explaining the rates set forth in your chart:

"In other words the state has picked out a comparatively small territory in Arkansas where this condition exists, to try to prove there is no relation between our state and interstate rates; while, as a matter of fact that comparatively small territory is an exception to the rule; although in that territory there is the relation between state and interstate rates as I have explained."

I will ask you if that is a correct statement that you have picked out a small territory there to prove this fact, and that that small territory is the exception to this rule.

Col. MOORE: The question is objected to because it necessitates the reopening of the line of testimony involved in the exhibit re-

ferred to and to that extent is original testimony and incompetent in surrebuttal, inasmuch as it may open up matter which would require further explanation on the part of the complainant.

A. First, on the question of the section of the line covered by Exhibit C-1 being the only portion of the line in Arkansas where the conditions illustrated in that chart were extant during
5155 the period of our inquiry I would say that I have taken the same tariff naming the interstate rates from St. Louis to points in Arkansas and have found that a similar condition exists on every section of the line which is covered by nine additional charts of similar character to Exhibit C-1, which I have prepared.

Q. Explain those charts, Mr. Hamilton, so it may be understood.

A. The charts are numbered for one to nine and to indicate the extent of the territory covered by them I have prepared as a recapitulation or summary of the charts an outline may of the Iron Mountain mileage in Arkansas, which appears first in the exhibit.

The portions of the Iron Mountain line colored in red are portions covered by the charts attached to the recapitulation.

The numbers shown opposite these red sections of the map are references to the charts which underlie it.

The mileage covered by the charts is 529 miles, including the territory covered by Exhibit C-1, which itself covered 7 miles.

Those 529 miles are 39% of the total Iron Mountain mileage in Arkansas.

The charts are similar in nature to Exhibit C-1, but cover different territory.

5156 Q. Explain the principle involved in this map and the charts.

A. Take one for example. Take chart five attached to the exhibit, the stations to which the rates apply, cover 79 miles on the White River division beginning at Fitzgerald just north of Newport and running to Cresswell. The red lines indicate the interstate rates from St. Louis to the various stations shown.

The graduated colored lines indicate the state distance tariff rates for the same mileage in Arkansas as would be covered on the haul from St. Louis on the through rate from St. Louis to these points.

It is not intended to compare the rates themselves in dollars and cents, but their relation one to the other.

To explain: First class rate from St. Louis to Fitzgerald was 80 cents. First class rate to Cresswell, 79 miles further distant (figuring the short line mileage via Diaz Junction) is also 80 cents. And the rate is 80 cents to all intermediate stations.

The first class state rate from the Missouri state line to Fitzgerald is 43 cents. The first class state rate to Cresswell, the most northerly station, is 56 cents, a variation of 19 cents, which is made gradually from station to station or in groups of five to ten miles.

The same is true of other state and other interstate rates.

5157 On this particular chart all of the interstate rates with the exception of class E are the same to the first and the last station on the chart.

Class E runs at the 15 cent level for 44 miles and at 16 cents the rest of the distance or 35 miles.

There is one chart to which I wish to call particular attention; that is number 2, covering eighty miles on the Helena branch; the first station being Jolly just south of Knobel, and the last station shown on the chart being Wynne, the junction of that line with the line from Bald Knob to Memphis, the distance between stations being eighty miles.

The first class interstate rates begin at 70 cents and is 70 cents to the first three stations shown on the chart.

The next station the rate is 71 cents.

To the next two it is 72 cents. And then to all except the last two stations on the chart or a distance of 48 miles, it is 73 cents level, raising one cent to each of the last two stations.

The second and third class interstate rates are absolutely level, being the same to the first station as to the last.

That is all true of the fourth class rate.

Class A from St. Louis recedes.

That is, the rate to the seventh station south or Paragould has dropped one cent, although the distance has increased.

5158 That is true of class B, the rate has dropped two cents when it reaches that station.

And of class C, which has dropped two cents. And class D has dropped two cents. And class E has dropped three cents.

That decrease in the rate remains effective for 19 miles, and then the rate resumes its former level and goes on on a parity with the first and second class rate.

On this same chart the state rates are graduated according to distance, the rates increasing in five or ten mile groups, according to the State Commission tariff.

Q. This was based on the rates in effect during the last half of the year 1907?

A. This chart was based on the interstate rates in effect during the last half of 1907 and also on standard tariff No. 3.

The map which is a recapitulation, bears a typewritten statement practically the same as what I have given here.

Q. The balance is made up practically in line with the explanation you have given?

A. Yes, sir.

Judge HILL: We offer in evidence this exhibit.

The exhibit referred to is marked "Defendant's Exhibit L-1.

Said exhibit is in the words and figures following to-wit:

For Exhibit L-1, see Vol. 9, page 5886.

5159 Judge HILL:

Q. Mr. Hamilton, you did not finish your answer I believe, as to the second part of the question?

A. I directed the answer so far given to covering the statement that Exhibit C-1 covered the only portion of the line where these conditions existed.

As I understand the latter part of your question, the quotation from Mr. Perkins' statement, was that a certain relation did exist.

Col. MOORE: I object to the witness going into the effect of it. That certainly would not be competent.

Judge HILL: I am inclined to think you are right about that.

Q. Mr. Hamilton, at page R7 Mr. Perkins in discussing the rates to Texas common points in answer to some testimony of Mr. Ludlam and exhibits filed uses this language:

"The rates to Texas common points are not made entirely from St. Louis. In many cases the rates are made from the territories east, and rates are then fixed from St. Louis on differentials under the rates so fixed from Eastern Territory.

This is due to the fact that the further east we go the more keenly do we feel the water competition of the Steamer Lines from New York to Galveston and Texas City. In adjusting our rates to Texas we attempt to arrive at a rate which will yield an average return. In other words, we do not figure on the rates to Paris, in the northern part of the state of Texas, nor on the rates to San Antonio, in the southern part of the state, but a rate which applied to the entire territory would yield an average return."

I wish you would state whether you have found that to be correct and if you think it is incorrect, if you have prepared a chart illustrating how those rates are made different from the way Mr. Perkins understood it?

5160 Col. MOORE: The question is objected to as not being proper surrebuttal evidence.

A. The rates are made in the way which Mr. Perkins says they are made. The tariffs show that.

But their division between the carriers hauling the freight results in greatly varying rates for the haul in Arkansas.

Q. You mean greatly varying revenue rather than rates, do you not?

A. Greatly varying revenue, assuming the business moves under the rates.

Q. What I am particularly calling attention to is the average of revenue. As I understand, that is made up by the rate and the division?

A. Yes, sir, that would be governed by the average movement of freight also.

Q. That is true. Now proceed with your explanation.

A. I have prepared a chart which covers the rates, or the Iron Mountain proportion of the rate in Arkansas on business from Chicago and Pittsburg and their surrounding territories, and St. Louis, to fifteen stations taken at random from the map of Texas:

The stations named are shown as taking Texas common point rates and I have selected the first class rates, for purposes of illustration.

Mr. PERKINS:

Q. Can you state what roads those stations are on, so we can follow that up?

5161 A. I have Victoria on the Texas and New Orleans.

Brownwood on the Fort Worth & Rio Grande.

Wharton, Texas, on the G. H. & S. A.

Abilene on the Texas and Pacific.

San Antonio on several roads, among them the I. & G. N. and I have figured I. & G. N. divisions on this chart.

Eastline, Texas ,on the Texas and Pacific.

Big Springs on the Texas and Pacific.

Austin on the I. & G. N. among other roads and I have used I. & G. N. divisions.

Corsicana on the Cotton Belt.

Waco on the Cotton Belt and I have used Cotton Belt divisions.

Palestine on the I. & G. N.

Fort Worth on the Texas and Pacific among other roads and I have used Texas & Pacific divisions.

New Boston on the Texas and Pacific.

Marshall on the Texas and Pacific.

Tyler on the I. & G. N. and Cotton Belt, and I have used Cotton Belt divisions.

The first class rate from Chicago to these points—that is, the proportion of it which Iron Mountain would earn in Arkansas is indicated by a red line.

The Iron Mountain Arkansas proportion of the Pittsburg rate is indicated by a blue line.

And its proportion of the St. Louis rates is indicated by

5162 a green line.

In arriving at the proportion accruing to the Iron Mountain in Arkansas, I have applied the regular divisions on Chicago and Pittsburg business north and east of East St. Louis, as shown in the company's division sheets current in 1907; and the divisions south of Texarkana as shown in their division sheets with the southern lines.

The remainder or the proportion of the rate between St. Louis and Texarkana I have divided between Missouri and Arkansas on a track mileage basis, which is the railroad's method in this suit, of locating revenue to Arkansas.

The chart speaks for itself.

The proportion of the rates in cents per hundred pounds is shown in figures across the top.

The lines extend to a figure which indicates the rate accruing to the Iron Mountain on its haul in Arkansas for the business for each station from each point indicated.

The rate accruing to the Iron Mountain in Arkansas on business from Chicago to Victoria, Texas was 31 cents.

From Chicago to Tyler, Texas, it was 59 cents.

Q. That would be exactly the same movement over the Iron Mountain tracks?

A. From the Missouri-Arkansas state line on the Iron Mountain rails to Texarkana.

Mr. PERKINS:

Q. You are using the first class rate?

A. Yes, that is the only rate shown on the chart. The rate used is the first class rate arrived at by adding the established dif-
5163 ferentials to the St. Louis rate on the Chicago and Pittsburg basis. And the divisions were obtained from the percentage sheets on file in the office of the auditor of freight receipts of the Missouri Pacific Railway.

The two extremes of the chart are 31 cents on the business from Chicago to Victoria, Texas, and 66 cents on business from St. Louis to Tyler, Texas.

The others speak for themselves.

Col. MOORE:

Q. They vary between those two extremes?

A. Yes, sir.

Judge HILL:

Q. I think it is in the record but I wish it restated here for the purpose of clarifying a situation:

The rate you have put down here is the proportion accruing to the state of Arkansas?

A. Yes, sir, on the basis I have explained, track mile division of the proportion of the rate from St. Louis to Texarkana.

Q. What I want to get at is, that track mileage basis is the one used by the railroads here?

A. In locating earnings to Arkansas, yes, sir.

Col. MOORE: I object to the statement and to the exhibit which counsel proposes to now file, on the ground of not being proper surrebuttal.

Judge HILL: We will offer in evidence this exhibit referred to by Mr. Hamilton. The exhbit referred to is marked "Defendant's Exhibit M-1" and is in the words and figures as fol-lows to-wit:

5164 For Exhibit M-1 see Vol. 9, page 5897.

Q. Mr. Hamilton, when you were on the stand before you were cross-examined as to various cars you traced up that were put before you in the October movement, Exhibit I, I believe it was. Redirect examination on that was deferred until you had time to look into the matter.

I will ask you if you have gone through that thoroughly and found out the extent of the errors upon which you were questioned in your cross-examination?

A. Yes, I have gone over our work sheets since that time. By "work sheets" I mean the sheets on which we worked up our figures which are condensed into Exhibit I; and have given particular attention to the cars referred to by Col. Moore in cross-examination

on the subject heretofore. I found there were thirty cars involved which were referred to as making sixty-eight different moves That is, as appearing sixty-eight times on our sheets. I do not mean that each of the cars appeared sixty-eight times but the thirty cars represented sixty-eight movements in the local trains.

I found that our weight as shown in tons in our classification as between state and interstate was correct on seven of these movements. I found that we had omitted to locate weights for forty-three cars in our statement, which cover some 20,835 cars.

I found that the sixty-one moves or sixty-one appearances of cars on our worksheets where we had made errors in ascertaining
5165 the weights or in classifying the weights when ascertained would when boiled down and applied to paragraph seven on page eight of Exhibit K result in taking $257.68 from the cost of intrastate business and adding that amount to the cost of interstate business.

That would be the net result of making the correction in our figures.

Q. Your error worked out against the state, then, to that extent?

A. Yes, sir.

Q. What percentage of error would that be? Have you ever figured that out?

A. If the changes I have indicated were made in Exhibit I, the percentage shown in that exhibit would read in this way:

Intrastate freight on local trains 39.02% instead of 39.10%.

Intrastate freight on through trains (I am speaking of ton mileage now) would read 60.98% instead of 60.90%.

Total revenue freight on local trains would read 11.17% instead of 11.18%.

Total revenue freight on through trains would read 88.83% instead of 88.82%.

Following that in Exhibit K it results in the change in dollars and cents to which I have already referred.

Col. MOORE: What cars does that result you have just now mentioned apply to?

5166 A. It applies to the car numbers——

Q. To which I called your attention?

A. Yes, sir.

Judge HILL:

Q. You remember at that time I told you I wanted to examine him further, after he had had a chance to look them up.

There is another matter in connection with that. You stated there were a few cars you missed; they were out of view in some way and you could not get the exact number: did you find that?

A. I think I stated it was 43 cars.

Q. Out of the total of 20,000?

A. Yes, sir.

Q. Which you never got trace of?

A. That we did not locate.

Q. I thought you passed that and had not looked it up?

A. I stated that in beginning my answer to your question.

Q. Mr. Johnson in his testimony criticised your October expenses in regard to labor and overtime, in which he stated as I recall it, that there would be an inaccuracy in it as to the labor and overtime that might appear in the last few days of the month; and this morning he corrected that as to the overtime and said there would be some lap-overs on the straight time.

A. Yes, sir.

5167 Q. From the last days of the month into the next month?

A. Yes, sir.

Q. I will ask you if you adjusted that and if so how you did it?

A. Our process for locating the labor cost for the local freight trains was to ascertain from the time books the amount of time, regular, overtime and constructive time, that was put in by each train crew; and apply to that the rate of pay indicated in the company's contract with the men in the different branches of this train service; and also indicated in the body of the time book opposite the trip, if the men were in diversified service, or at the head of the page if they were in one class of service throughout the month.

We found at some times one portion of the crew would not have gotten its time slips in to the timekeeper for the last day or the last two days of the month in time to get it into the timebook.

As I understand the process, the conductor reports time for himself and the brakeman under his supervision; and the engineer reports the time for himself and the fireman. Sometimes the engineer's timeslip would not have been reported. If that was the case we gave him the same time, regular, constructive and overtime, as the conductor got but at the engineer's rate of pay.

If the conductor's timeslip was missing we gave him the same time as was reported by the engineer, at the regular rate of

5168 pay for conductors; and the same thing in the case of the brakemen.

I recall no instance where timeslips for both ends of the train—if I may put it so, were missing.

But this is true as to lap-overs: I recall a few items of September time paid for in October. They were the omissions made in September. There were a few of those, but not many. But the time we have obtained for the local trains and the cost of that labor is, I think, accurate. I think our method is correct for the reason that I can conceive of no way a conductor could be engaged in road service without an engineer or an engineer without a conductor.

Q. That difference belongs to what we have designated as "negligible quantities"?

A. I think so.

Col. MOORE: I would like him to state what he did in cases where he failed to get the time of both the engineer and the conductor?

A. I do not recall any instance where we did not get one end of the train crew. But if that were the case my instructions were, and I did it for such portions of the statement as I made myself, to take the time shown by the dispatcher's sheet for that portion of the road. It might be that we might miss some few hours representing both ends of the train crew.

Judge HILL:

Q. Were those instances many or few?

5169 A. I do not recall many such instances. My memory does not recall them, if there were any.

Q. Mr. B. W. Moore, trainmaster, testified in rebuttal on the order of cars in trains leaving terminals and put in an exhibit for redball train No. 55 as an illustration of the fact that the trains were not broken up in terminals. There was also some question as to the order in which the trains were made up:

I will ask you to take his exhibit and apply the wheel reports to it and see what the result would be on that, Mr. Hamilton?

A. I have not in my possession the wheel reports which cover Mr. Moore's Exhibit. That covers train 55 for the entire month of October. But, as I understand the purport of the exhibit it was to show that train No. 55, or the trains of which train No. 55 was assumed to be a type were not broken up, or did not receive much switching at division or district terminals.

I made considerable examination of the wheel reports for October, 1907, during the time we were handling them for the purposes of our local train figures, and for the statements which I have put in evidence before, as to the delay of cars in through trains at district terminals, and predicated on the assumption that rule No. 2 on the back of the wheel report, which states that "cars must be reported in train order, commencing with the caboose, to show the makeup of trains, leaving division terminals," and predicated

5170 on the assumption that that instruction was followed and that the conductor listed his train in the exact order in which it was made up, I did compare practically all of the wheel reports into and out of these district or division terminals for October, 1907, and found that the order of the cars leaving the most central terminals, for instance Hoxie, was different from the order in the train of the same cars leaving Little Rock, in a great many instances. I take that as an illustration.

I assumed from that if both conductors followed the instructions and listed their cars from the caboose to the engine, or vice versa, as they stood in the train, that shifting must have taken place and on that I predicated my belief that trains were shifted at division terminals.

Mr. Moore said that the conductors disregarded that instruction, in order to group the cars, system and foreign for the benefit of the car accountant, to minimize the work in his office.

The actual inspection of the wheel reports does not develop that they group the cars in that way.

I have before me the original wheel reports furnished me by Mr. Johnson for the Arkansas Division, for the 10th of October, 1907. I selected this at random from several I had gotten from him for the purpose.

The first train shown here is an extra through train from Little Rock to Texarkana on October 10, 1907, being extra No. 58.

5171 I find out of a total of 55 cars exclusive of the caboose in the train, the first three are foreign cars, then two system

cars; another foreign car; another system car; then a group of eight or ten or twelve foreign cars; another system car; two more foreign cars; another system car; six foreign cars; three system cars—and so on down; indicating there was no regrouping of the cars by the conductor for the purpose of expediting the work of the car accountant. And he had to all appearances followed the instructions on the back of the report and listed his train as it stood.

That is true of every other train, in fact, all of the through trains, in which there were both system and foreign cars, in this entire day's wheel reports.

On that I based my idea that train No. 55, the redball crack train on the main line which got little or no terminal handling was not a type of all the through trains on the road.

Q. Mr. Amoucek put in some exhibits on that subject, did he not?

A. He covered practically the same ground as Mr. Moore, taking some thirty trains out of Hoxie as a type.

Q. How did he get the thirty trains?

A. He took them from some work sheets we had prepared, on which we counted the cars into and out of the terminals and on which we showed lapsed or delayed time in the terminals.

5172 We simply prepared that to use in a division of expenes.

The other sheets were made—those to which in my mind Mr. Amoucek's criticism would better be applied—were sheets in which we showed the breaking up of these trains at terminals and varying delays to the cars.

Q. He did not criticise those?

A. No, sir, his testimony was along the same line as Mr. Moore's as I understood it.

5173 Following the afternoon session, 12/17.

Q. Mr. Hamilton, have you examined Mr. Roth's exhibit and testimony in the form of statistics, copied into the record in his rebuttal testimony, commencing at page 867?

A. Yes, sir.

Q. Do you understand the purport of those or the method or manner in which they were made up?

A. I think I understand the method in which the table on page R. 869 was made up, but the purpose of the exhibit I cannot satisfy myself as to and do not quite understand.

Q. Do you know of any bearing it has in this case at all, as far as you are able to judge it?

A. I must confess that I have not been able to see its application.

Q. Take that table on page R. 869 and state what you understand it is.

A. I understand that is a table showing in six groups of commodities, the relative percentage in ton miles of each group to the total and the relative percentage of revenue under two heads, one covering the entire Missouri Pacific Iron Mountain system, and the other intrastate business in Arkansas.

The basis on which that was made up, or the method on which it was compiled, was stated by Mr. Roth on page R. 867, to the

effect that he has graded the various commodities into six groups, according to character, loading, risk of loss and damage, handling and incidental cost.

Q. Do you know how any such grading as that could be made?

A. I think it would require an intimate knowledge of

5174 transportation conditions and the results of transportation.

Q. Do you know of any system of grading that way, or is it apparently some opinion that is expressed in that way?

A. The groups are arrived at on a variety of assumptions which are set forth under the head of each group, and which, it seems to me, would require an intimate knowledge of transportation conditions and the results of transportation. The assumptions are that certain classes of freight are more liable or do receive actually, more loss and damage, more handling, etc., as set forth.

Q. That goes into the realm of opinion, purely, as to whether those assumptions are correct or not?

A. Exactly, unless we had statistics as to the effect of transportation on these various commodities.

Q. Do you know of any such system as that, anywhere?

A. No, sir.

Q. You have been investigating?

A. Special investigation given it may determine that, perhaps, to some extent, but——

Q. Without having some key to guide you, as a basis, does that mean anything to you as it stands?

A. Not without knowing Mr. Roth's reasons for grading the commodities as he has grouped them and what are in the group, in detail.

Q. And what influenced the putting of this commodity or that, into this group or into the other group?

5175 A. We would have to know the rates of the various commodities; the average haul of each commodity; the amount ordinarily transported; the proportions of each commodity to the other commodity in the group, before we could arrive at a definite conclusion.

Q. What is Mr. Roth's work; do you know the line of work he has followed?

A. From my observation in and about the General Auditor's office in the Missouri Pacific, he has been engaged in compiling statistics of various kinds and especially in the last year or so in getting up a statement of the effect of the application of the inhibited rates in Arkansas on the current traffic.

Q. He is a statistician?

A. I so understand.

Q. One of the witnesses for the Iron Mountain, in rebuttal, Mr. Cannon, I believe it was, testified that during October, owing to a congestion of the business, that there was a shifting of through business on to the local trains in Arkansas:—probably other witnesses expressed opinions along that line, but I remember that one in particular:

Have you investigated that question and prepared any statistics on that subject?

A. Yes, sir.

Q. I wish you would give us the benefit of it.

A. Exhibit "I" filed by the State, covering the month of October, 1907, shows the average number of cars per local train to have
5176 been 16.6.

As I recall what Mr. Cannon said, he stated that to relieve through trains during the month of October—which he said was a more or less congested period—they had burdened the local with more than it would ordinarily haul of freight which went from one end to the other end of its run. That is, it carried some of the burden of the through train during that period and that that would reflect itself in any ton mileage figures that might be made as to the local trains' performance.

As I recall it, he stated that that would result in putting more than a normal amount of interstate ton mileage on the local trains.

Q. That is the substance of it.

A. I have had in the last week or two weeks, the wheel reports for all of the local trains on the Iron Mountain in Arkansas, for the month of March, 1907, a spring month of the same year.

I find that the average cars per local train, for that month, were 16.7.

Q. What was it in October, 1907?

A. 16.6.

Col. MOORE: I do not think it is proper for you to go back——

Judge HILL: You are the one that brought that in in rebuttal. We took your testimony to begin with, that October was normal. We did not introduce testimony on that, and then in rebuttal you took this testimony of Cannon and others, to show it was not.

5177 Col. MOORE: This is objected to because it is a reopening of a matter that has been gone into before by the state.

A. The figures that I have just quoted were obtained from the wheel reports and the car mile calculations shown in the wheel reports by the statistician in the car accountant's office.

Those figures which we have abstracted for the local trains were an integral part of the total car mileage figures made by them for that month for the information of the operating officers of the Company and other statistical purposes.

The method followed was to abstract the car miles made by the local and the train miles made by the local and dividing the car miles by the train miles to get the average number of cars in the train each mile, which is exactly the process followed in compiling Exhibit "I" for October.

Q. You just matched March, 1907, with October, 1907?

A. Yes, sir.

Q. And found on the second decimal a difference of one point?

A. On the first decimal a difference of one-tenth of a car more in March than it was in October.

Q. Have you any other statistics on that point?

A. Do you mean as to the normality of October, from a transportation standpoint?

Q. Yes.

5178 A. Yes, sir. I have made a comparison of the October movement with the six months which covers the period of our inquiry in this case, the last six months of 1907.

I find that the freight train miles made in Arkansas on the Iron Mountain in October, 1907, were an exact one-sixth of the freight train miles made in the six months ending December 31, 1907—16.63%, an exact one-sixth.

I find that the freight car miles made in October, 1907, were also one-sixth of the freight car miles made in Arkansas during the latter one-half of 1907; they were 16.57%, virtually one-sixth.

Q. You mean per cent of what; of the total train miles made?

A. No. The October car miles were one-sixth of the freight car miles made in the six months' period.

Q. Ending December 31, 1907?

A. Yes, sir, the period of our inquiry here.

Q. Anything further?

A. No, sir.

Cross-examination.

By Col. MOORE:

Q. Mr. Hamilton, are the state rates upon which the graphic chart filed by you as Exhibit "L-1" is based, the rates prescribed in the Standard Distance Tariff, No. 3, put in force by the Arkansas State Commission?

A. Yes, sir. That is, they were taken from Standard Distance Tariff, No. 3.

5179 Q. Of the Arkansas Commission?

A. Yes, sir, the copy was furnished by the Commission.

Q. I will furnish you a copy of that and if it is not already in, will you file as an exhibit a copy of that tariff? If it has already been in evidence, and I think it has, it will not be necessary to do it.

A. Yes, sir.

For Exhibit N-1, see Vol. 9, page 5899.

5180 Mr. WRIGHT, recalled, testified as follows:

Redirect examination.

By Judge HILL:

Q. You testified in this case on an estimate of switching done by local trains and criticism has been made of your testimony in regard to two stations, that I feel call for an explanation.

Here is a statement given in Mr. Johnson's testimony at page 886:

In referring to your work-sheet he says:

"I notice in his worksheet he allows at Bald Knob ten cars, five set out and five picked up. But for some reason allows but ten engine trips.

At Kensett he allows four cars set out and four cars picked up, making eight in all; but allows only ten engine trips."

I wish you would explain why you made it in that way, if that is the way you made it?

A. When I made that statement I had in mind the peculiar condition that existed at Bald Knob, which is the junction station of the main line and the Memphis branch.

At Bald Knob proper the business is very light, but there is likely to be probably an average of three cars that would be picked up by the southbound Iron Mountain locals that would be destined to points on the Memphis branch. The Memphis branch local
5181 does switching for those cars, both those to be delivered to the main line and those to be received from the main line. Therefore, it would not be necessary for the main line local to perform any more than what is called a short "kick," kicking those probably three cars to the lead of the Memphis Branch.

The same would be true of cars that would be picked up at Bald Knob, that were set out there by the Memphis branch local at a point just south of Bald Knob.

Q. If I understand you, there are more cars there than are switched locally?

A. That is the idea.

Q. And you put down the number of cars and put down for switching trips the number that would be switched locally?

A. Yes, sir, and made a larger allowance for the locals than might be made for the Memphis branch, for instance.

Q. What about that Kensett situation?

A. The Kensett situation is somewhat similar to that at Bald Knob. The main business at Kensett is with the Doniphan Lumber Company. Kensett is a very small local station—that is, the business for Kensett proper is very small. The main business there would be for the Doniphan Lumber Company, which is a company situated about two miles out on a little branch line running from Kensett out to Red River, and the Doniphan Lumber Company operates its own engines and it has the privilege of coming in on the Iron Mountain track, and picking up cars destined to its
5182 mills, and also placing cars destined to points on the Iron Mountain road. So it is unnecessary for the Iron Mountain engine to do anything more than set those cars for the Doniphan Lumber Company out on the switch. It is unnecessary to make any switching movement for them, except a short kick.

Q. And you allowed for the switching locally to Kensett, and not for that performed by the Doniphan Lumber Company?

A. Yes, sir, I figured that the business at Kensett would average about one car a day. That would be a high average. That would be two cars a day each way; that is twenty cars—or whatever number of working days they have. It would be a high estimate, too high an estimate.

I see I allowed here four engine trips. That would allow one engine trip for the business of the Doniphan Lumber Company

and one for the business for Kensett. That is the way the conditions I had in mind were when I made this statement.

Cross-examination.

By Col. MOORE:

Q. Mr. Wright, you did not refer to these matters you have just now explained, in your former testimony, did you?

A. Those peculiar conditions? No, sir, I don't believe I did. I do not remember that I did.

Q. In your statement when you were on the stand, you allowed for four cars set out at Kensett and four picked up; and you
5183 allowed for ten engine trips. Does not it usually take two engine movements to set out a car and pick up? Would not that ordinarily allow for sixteen engine movements?

A. It might be possible it would take that many.

Q. Does it not usually do so?

A. No, sir, not in practical railroading.

Q. If you set out a car you have to move it to the track where it is going to be set out, do you not?

A. If there are four cars it might be that they are in such a position in the train that it would be necessary to make a switching movement for each car; but it would be hardly probable.

Q. In several other places I notice you have allowed two engine movements for each car: why did you not make the same allowance at Kensett?

A. For the reasons I have just stated—that the main business at Kensett was for the Doniphan Lumber Company and switching was not required.

Q. On what basis can you assume that eight cars would require just ten trips?

A. I don't know why I made the statement of eight cars. I did not have that many in mind.

Q. That is your statement given in evidence, is it not?

A. That was too high an estimate, if I made that estimate. I do not think the business will run that much.

Q. You assume your evidence was mistaken in that respect?

A. If I stated eight cars that is a mistake.

Q. Four cars set out and——

5184 A. As I stated, probably one would be for Kensett and the others would be for the Doniphan Lumber Company.

Q. You stated "probably"; you do not know?

A. It is all probability. I do not know any of these as true facts.

Q. It is all assumptions?

A. It is not based on any actual statement that has been made but merely my opinion formed from the business at those stations.

Q. In other words, it was simply your inference or assumption: you cannot say that is correct, can you?

A. I made up no statistics for those stations. Although I try to make a high average for them.

Q. At Bald Knob you show five cars set out and five picked up

and you allow ten engine movements; whereas, at other places you have doubled that: why did you make that difference at Bald Knob?

A. Just because, as I stated, the Memphis branch local does the switching for this business. It picks up and sets out at Bald Knob for the main line. That is an operating condition that prevailed there.

Q. You explained that in your examination in chief. What I want to ask you is this, you predicate that upon the assumption that all the Memphis branch line switching must be done by another engine and not by the Iron Mountain road?

A. Yes, sir, that was the operating condition that was in force at the time and is yet so far as I know.

5185 Redirect examination.

By Judge HILL:

Q. Were you familiar with the way the passenger traffic was handled through Little Rock in 1907?

A. Yes, sir.

Q. Here is a statement to which I direct your attention, made in Mr. Johnson's testimony at page 903. It reads as follows:

"If the passenger buys a through ticket to a point reaching beyond the state of Arkansas, I cannot conceive of any item of expense which should be included under station service, that would be charged to that passenger."

"Is it not the universal rule that a trans-state passenger, as well as all other passengers, buy a ticket from the origin to the end of their trip?

A. Yes sir."

I wish you would explain how the trans-state passengers are handled at Little Rock. Take the passengers from Texas that go east through Memphis; or take passengers from the south that go west through Fort Smith: Explain that situation there, Mr. Wright, if you please?

A. The trans-state passengers from the Iron Mountain between Little Rock and Texarkana destined to Memphis would use train No. 4 or No. 8 into Little Rock. They would use the two morning trains.

Q. You mean by that a train running from Texarkana to Little Rock?

A. Yes, sir. They would use the morning train from
5186 Texarkana to Little Rock and then change at Little Rock, taking train No. 204. They would change at Little Rock and take the train from Little Rock to Memphis.

Q. They make close connection there?

A. No, sir. Between train No. 4 there was, as I recollect it about 1 hour and 40 minutes and for train No. 8 there was pretty close connection, not more than 20 minutes.

Q. How about those passengers going south, through Memphis, using Memphis as the gateway from the east. All that travel going

through Memphis and coming back the other way, coming from the east and going into Texas: how is that handled?

A. They run two passenger trains from Memphis to Little Rock. One that arrives at Little Rock in the morning and the passengers would have to change cars at Little Rock and take the main line train. Those that used the other train, known as No. 223, would go straight through to Texarkana.

Q. There is one of those trains that goes straight through to Memphis?

A. One goes straight through. But the fastest train, No. 204, runs only to Little Rock and the trans-state passengers would have to change cars at Litle Rock for points south of there.

Q. Suppose a passenger from Louisiana on the line of the Iron Mountain road coming to St. Louis would buy a ticket at
5187 Alexandria or Monroe or any other of those points down there, how would that be handled?

A. They would have to change at Little Rock.

Q. They would have to spend the night there, would they not?

A. No, sir, if they used the Iron Mountain train No. 5 they would make quick connection there—that is, not more than one hour and twenty minutes. And the same is true of the night train. Unless the night train is late they would not have to stay there all night. And the same is true of the business for the Fort Smith branch. They would have to change at Little Rock.

Q. How about the White River branch? Say a passenger coming from Memphis, Louisiana or Texas or any other point beyond the state of Arkansas, coming into Little Rock and going out to Springfield, Missouri, or any point on the White River branch?

A. They would make a change, one at Bald Knob and one at Newport.

Q. They would change at Little Rock, too, wouldn't they?

A. Not a passenger from Memphis.

Q. Take a passenger from Louisiana or Texas.

A. Oh, yes, he would ch. there.

Q. He would make three changes, would he not?

A. Not necessarily, no, sir. It would not be necessary to change except at Newport. From Texas down to a point beyond the
5188 state line on the White River branch, would be a trans-state passenger or an interstate passenger and would change at Newport.

Q. For the purposes of this question, Fort Smith is a trans-state point.

I will ask you how the travel from Fort Smith going east by way of Little Rock to St. Louis, Memphis, New Orleans down to Texas would be handled?

A. You mean with regard to changing cars?

Q. Yes. Could they make any through trips?

A. No, sir, not the way the trains are operated. They would have to change at Little Rock.

Q. In any direction they wanted to go to get out of the State?

A. Yes, sir.

Q. I believe I am mistaken in saying that Fort Smith would be a trans-state point. It would be for half only. I believe that is right—is it not Mr. Johnson?

Mr. JOHNSON: To the extent of those two trains that cross the bridge.

Mr. WRIGHT: Two cross the bridge and four others do not

Q. There is a nearer connection between Fort Smith and St. Louis by the Frisco than by way of Little Rock, isn't there?

A. I believe there is.

Q. You don't doubt it much, do you?

A. I don't doubt it.

5189 CHARLES S. LUDLAM, recalled testified in sur-rebuttal as follows:

Direct examination.

By Judge HILL:

Q. Mr. Ludlam, in an exhibit filed by the Railroads, number 56, in "Maintenance of Equipment" subdivision (*b*), under the head of "stopping and starting" the Railroads have put this in:

"Car miles, same, with local car miles multiplied by eight."

In an exhibit filed by the State the same factor was used, except the multiple was four, representing (as explained in the testimony) four stops of the local as against one of the through: Now, I assume that this "eight times" is based upon the testimony of Mr. Gray and Mr. Ward, which I want to read to you:

Mr. Ward, at page 617, after quoting your exhibit "K" said:

"I assume that these average distances as stated are approximately correct. But that does not constitute a proper measure of the expense of handling local as against through service, because the through train in starting and stopping simply takes the siding, and after it has met the train, which has the right of the road, it then proceeds; or, in many cases, its stop is only for the purpose of taking coal and water and it does not have to stop even while the man turns the switch. On the other hand, the local train goes into the siding and after it is there it has its work to do by taking out the cars or placing in cars at the various industries or on the house track at that station; and it must pick up other cars and place them in the train. To an extent that constitutes, for all practical purposes, a terminal handling for all of the cars in that train at practically every station along the line of its run. So the multiple of four to one for the through service, on account of the assumed difference of five miles and twenty miles would not be correct.

5190 It would be more nearly eight times, although I don't know that eight miles is accurate. However, it is more nearly eight times than it is four."

And Mr. Gray, at page 712, makes practically the same statement, without using this figure 8 as a multiple:

I want to ask you if they are correct in using eight instead of four and for the reasons that they give?

A. No, sir. The multiple of four is used to apply to the question of starting and stopping only. The question of the increased cost of the terminal handling on the local train is covered by a separate allowance.

Q. Where is that? Point that out. I think these gentlemen just failed to understand that and I want you to point it out.

A. That is on the same exhibit, under subdivision (*b*) "Maintenance of equipment."

We make an allowance just below the allowance referred to for stopping and starting. We make an allowance for terminal handling by multiplying the mileage of the cars in the local trains by two and using the mileage of the cars in the through trains as they were.

Q. What does that represent, Mr. Ludlam?

A. That represents that on the average the cars in the local train will receive two terminal handlings to one terminal handling on a through train. That is in the case of the Iron Mountain, I am referring to.

In the case of the Cotton Belt we allow four terminal handlings on a local train to one terminal handling on the through

5191 train.

That is based on the premise that the local train will start out with a load of cars and that it will distribute all of those cars during the course of its run, and that during the same run it will pick up an equal number of cars, which it will carry into the last terminal.

That assumes that every car on the local train will be set out during the course of the run of the local train and another car picked up in its place. As a matter of fact there are some of the cars that start out of the terminal, on a local train, that go through to the end of the run of the local train without being set out.

Q. That operates as a maximum as against the local train on this terminal handling between division points?

A. Yes, sir.

Q. And it is the very item that Mr. Ward and Mr. Gray discuss, is it not?

A. Yes, sir.

Q. I presume those gentlemen had not studied the exhibit carefully enough to see that that is taken care of.

A. I should assume from their evidence that they did not understand the exhibit.

Q. To take the eight times, as done there, would practically amount to doubling all these cars set out, and every car set out and in, would it not, following your plan?

A. It would be an attempt to provide for the terminal

5192 handling under the specific allowance made for stopping and starting, although, as I have already stated, the terminal handling is taken care of in another place.

Q. It occurred to me at one time that probably they were confusing that stopping and starting also with the terminal handling in the division: is not that taken care of?

A. Yes, sir.

Q. And this is merely the terminal handling between the divisions?

A. Yes, what you might call "on the road".

In that connection I would like to say before we get away from that, that we consider an allowance of four stops of the local train to one stop of the through train, as being the maximum that could possibly accrue to the local train for the stopping and starting expense.

Q. I think Mr. Ludlam, subsequent developments have proved that it was the maximum.

A. The same remark would apply to the allowance which we made of two terminal handlings for the cars on the local trains. We thought that would be the maximum that could possibly be reached.

Q. Mr. Gray, at page 704 of his testimony, in criticising the use of the car mile as a factor for "Maintenance of Way" gives several reasons why in his opinion it is not a sound factor and then stated: "A further inclusion of caboose mileage only accentuates this difference."

5193 I wish you would state if the caboose mileage is included in your car mile statistics, and if so, where it is.

A. The caboose mileage is included, and the caboose mileage is included in order that the maximum expense of operating the local trains might be ascertained.

The average number of cars in the local train is 16.6, including the caboose; 15.6, without the caboose; whereas the average number of cars in a through train, including the caboose, is 33.2; without the caboose, 32.2.

Consequently, if you eliminated the caboose, the mileage would be in favor of the local train. That is, it would tend to reduce the cost of the local train. By adding one car to a train that otherwise would consist of 15.6 cars, you increase the proportion of the car mileage of that train to the total car mileage, more than you do the mileage of the train that carries 32 cars, by adding a car.

Q. So if there is any error in including the caboose mileage there, it is an error that would operate against the local train and consequently against the state traffic?

A. Yes, sir. I would not say it was an error, but the result of including the caboose mileage is that it operates to increase the cost shown by us of handling the state freight.

Q. Mr. Gray seemed to intimate it was an error: I wish you would give your views about that.

A. Well, the caboose is a necessary part of the train, and in attempting to distribute the cost between the two trains, the
5194 local and through, I think you should consider the elements of those trains.

Q. Mr. Gray, at page 719, and Mr. Ward, at page 621, criticise your use of train mile for "Other train expenses" and argue that on account of such items as "casualties"; "personal injuries occurring on trains"; "wrecks"; "stock killed"; "damages to persons and property"; "flood damage"; "road signal men"; "crossing watchmen";

2269

and "freight car lubrication", being included in that, the train mile is not a proper factor:

I wish you would state if you think the train mile is a proper factor, in view of what they have brought out in regard to what is included in that account?

A. I see nothing in the points raised by Mr. Gray or Mr. Ward that would change my view of our distribution being the correct distribution. Certainly there could be no question as to the majority of those items, and such question as there may be, if those items were divided on the car mileage basis, instead of the train mileage basis, it would tend to reduce the cost of the local train service, and therefore any criticism that is made of the method which we have adopted, would be to the effect that we had charged too much to the local trains, which would ultimately have the effect of increasing the cost as shown by us of doing the state business.

Q. Some of those items have been discussed by other witnesses, such as "stock killed"; "road signal men", and others:

5195 I wish you would state, in view of what they have brought out, in regard to these different items, why the train mile instead of car mile or any other factor, is proper.

A. In the case of "signal men", the signals are maintained for the operations of the train and not for the individual unit of the train.

In the case of "wrecks", if the train was wrecked, it would apply, I should think, rather to the train than to the unit of the train.

In the case of "lubrication", that would apply, probably, more specifically to the unit in the train than to the train itself, but inasmuch as the through train is a much longer train than the local train, the distribution of the lubrication on a car mileage and engine mileage basis would tend to reduce the cost of the local train as compared with the division used by us.

The "Highway crossing watchmen", which is also included in that expense, would apply to the train rather than to the unit of the train. The watchman is maintained to signal pedestrians and road vehicles against the train and not against the individual car of the train, without regard to the length of the train.

"Stock killed" might be allocated in many instances to the individual train, but some of the stock that is killed—and a considerable proportion of it—you could not locate the specific train that caused the accident.

Q. You could not very well allocate it to a car.

5196 A. No.

Q. I believe Mr. Johnson worked out some way of allocating it to trains, but I do not think he has as to the car.

A. For all those items I think, as I said before, that a train mileage basis is fair and equitable, and any way, in my judgment, in which it is not equitable, it is against the interest of the State in this controversy.

Col. MOORE:

Q. If you had divided that on a basis of train instead of train miles, what effect would it have had on the expense of local trains?

A. I don't know just what effect it would have had.

Q. Would it not have increased the cost of local trains?

A. I don't know just what effect it would have had, but the train mile basis, to my mind, is more equitable, for the reason that a train running 200 miles is much more apt to be the cause of any one of these charges, than a train running 50 miles. Therefore the train mile basis would seem to me more equitable than a train basis.

Q. If Exhibit "I" shows it was divided on the train basis of the number of trains, that would impose a larger cost on local trains, would it not?

A. I do not think Exhibit "I" shows that. Exhibit "I" does not show the local trains.

Q. How about "33% of the trains were local; 116 out of 3,874"—if I read these figures correctly: that would be about 33%. You can you look at that table and see what per cent you get.

5197 A. If it was distributed on the number of trains it would increase the charge to the local trains.

Q. Is it not a fact and is it not shown by all the evidence in this case, that the local trains cause more damage to stock, for instance, than through trains; more casualty damage in the way of killing stock, than through trains?

A. I have not heard any evidence to that effect and I should not assume it.

Q. Also "personal injuries": do you know about that?

A. Only in a general way, Mr. Moore.

Q. The testimony shows that local trains travel faster between stations than a through train, does it not?

A. There has been some testimony that in between stations the local trains travel faster than the through trains.

Q. If that is true, in view of that fact and also of the switching service done by local trains, is that not more likely to inflict more personal injuries and casualties?

A. I should say that it would be apt to cause more personal injuries, but I would not say casualties other than personal injuries.

Q. Running more rapidly through the country, between stations, would result in more largely killing stock, would it not?

A. No, sir, I don't think so. I think that the through train, as a rule being a longer train, a through train is not as apt to stop as quick if a cow gets on the track as the local train.

5198 Q. The velocity of the train has some effect?

A. Yes, but I think there is very little difference in velocity between the average speed of the through train and the maximum speed of the local train.

Judge HILL:

Q. I do not believe Col. Moore has quite correctly stated the testimony: there is some testimony that the local runs faster—and I believe some that it does not—but I believe that the great weight of the testimony is that it is about the same between stations, about twenty miles:

Is that a matter that you have any personal knowledge of, to speak of?

A. Only in a general way, but my answer was based on that and I think I so stated, that the average speed of the through train would be approximately the same as the maximum speed of the local train.

Q. Mr. Moore's questions have indicated that that account ought to be divided on the train basis: I wish you would express your opinion about that. It is a new factor to me.

A. I did that. I have already expressed my opinion that the train basis would be an erroneous basis, for the reason that you would then be charging against a train that ran 50 miles the same amount you would against a train that ran 200 miles.

Q. The proper way to reach it would be the train miles?

A. I think that is the most equitable way of reaching those
5199 items included in that specific account.

Q. Mr. Gray, at pages 730 and 734, and probably in other places, refers to the fact that in your exhibits you drop the locomotive mileage. I will read you from page 730:

"Q. Will you take up that exhibit before you and begin with the beginning of it and call attention to such parts of it as you desire and state your views about them?

"A. In the deductions throughout this theory, starting in with "Maintenance of way and structures" the car mile basis has been adopted entirely.

Why the locomotive mileage has been dropped, although used in freight statistics, it is hard to understand; especially as the proportion of locomotives to cars is very much greater in passenger than it is in freight."

And at page 734:

"I want to say that it is not an over-statement to say that in the shops 90% of the tools are provided for and are used in connection with locomotive repairs."

Then he goes further in the matter of repairs—the expense of repairs to locomotives, and I think in some other place, he criticises your exhibit for having used that for freight statistics and not in the passenger, if I recollect correctly:

I wish you would state why you have dropped that locomotive mileage, why you have done so.

A. In arriving at the passenger expenses, we distributed the expense direct to the passenger. We made no separation between the two classes of trains, local and through. Consequently, there was no object in distributing the expense to the locomotive because if we had done so, after distributing it to the locomotive we would have had to redistribute it to the passenger. So we distributed it direct to the passenger.

5200 Of course, all of the locomotive expense in the passenger service is incurred for the passenger business.

Q. You distribute that, as I understand it, on what is done behind the locomotive?

A. Yes, sir.

Q. In doing that, Mr. Ludlam, have you taken care of the locomotive expense and everything else? I want to understand whether that system would take care of all those items which Mr. Gray has referred to in his testimony?

A. Yes. We have distributed all the passenger expenses to the passenger business, whether incurred in direct connection with the locomotive or other parts of the passenger service?

Q. There is another place here where Mr. Gray seems to misunderstand your testimony, page 810 and 850: at page 810 he says:

"My judgment is that the car mile basis in a case of this kind, while it presents objections (os do all arbitrary sub-divisions) it does not present them in the same degree or to any such degree as the further attempt to divide the expenses attributable to any one state for car repairs between through and local on a car mileage basis, because there now enters into the equation a distinction as between short and the long haul."

Now at page 850, where he is referring to a car mile division between states:

"I think that a division of that kind between states is equitable and I don't think that a division of that between local and through trains is equitable, because it does not take into consideration the elements of difference brought about by the short and long haul."

5201 I will ask your opinion about that criticism of your exhibit and whether or not you have taken care of the short and long haul in that?

A. The criticism is not based on that because it is self-evident that any man who says that the car mile does not take into consideration the long haul or the short haul, either does not understand what the car mile means, or else does not understand what he is talking about.

Q. How does a car mile operate to take that in?

A. If a car moves one mile, that makes one mile; whereas if that car moves two miles, it makes two miles; if a hundred miles, that car makes one hundred car miles. Consequently, the element of distance is the most important element he does consider, and is the basis of the car mile.

Q. Mr. Ward, at page 613, criticises the method used by the state in apportioning the expense in terminals, of counting cars in and counting them out, and says that the proportion chargeable under this method, to through service, would be much greater than is actually the case, and adds this:

"The opinion of myself, or any other operating official, as to the excess cost of handling state over interstate business is on the basis of actual freight and not on the basis of the number of cars passing through the yards."

I presume from Mr. Johnson's testimony this morning, that is very likely the foundation for his distribution of that expense on the ton basis, in his exhibit No. 56.

I will ask you what is your opinion of that basis which is
5202 used here in this exhibit, on the testimony of Mr. Ward, which I have read to you?

A. You are asking what I think of the basis used in Exhibit 56?

Q. Yes, which I assume to be based on Mr. Ward's testimony, which I have read to you.

A. I think the basis is wrong, because it assumes that a ton of freight which moves 70 miles would have the same terminal service as a ton of freight that moves 224 miles.

Q. Those are the respective lengths of haul in this case on the Iron Mountain, I believe?

A. Of state and interstate.

I think I have already testified that, speaking generally, every ton of freight that passes through a terminal gets some handling at that terminal. I think also it is a matter of general railroad knowledge that the large and expensive terminals are required more and used more for the through business than for the local business.

Q. What effect would that length of haul have upon the proposition which you have referred to?

A. The effect, as that principle is used in exhibit 56, is that you charge as much for a terminal handling to the ton that moves 70 miles as you charge to the ton that moves 224 miles. You fail to take into consideration the most important element in distributing all expenses, and that is the use which is had from the expense incurred. The ton of freight that moves 70 miles, will, of
5203 course, not have the same use of the terminals as the ton of freight that moves 220 miles. Therefore, when you attempt to distribute your terminal expense on the tons handled, you arrive at a false conclusion and your figures are correspondingly unreliable.

Q. In that connection I might call your attention to what I believe to be evidence in this case, that the average local freight run in Arkansas is 70 miles and that of the through is 98: I think that is correct—it is approximately correct.

A. The average run of what?

Q. Of the local trains is 70 miles and the average run of the through would be 98 miles: what effect would that have upon this question, in terminal handling?

A. Well, there would be more terminal handling charged to the through trains than the local trains, because they run farther.

Q. The haul for interstate freight being 224 miles, would take in two terminals and probably three?

A. The average haul of interstate freight is shown on exhibit 26 to be 218 miles.

Q. That would take in at least two, if not three?

A. The average haul of the interstate freight being 218 miles, would use at least three terminals, and possibly four. That is, the terminal from which it started; a terminal, we will say, at the end of 100 miles; another at the end of 100 miles, and a terminal at its destination.

5204 Q. One of those four would be outside of the state, on the interstate?

A. Yes, except where the terminal happened to be located right at the borders of the state.

Q. That situation, I assume, makes manifest the incorrectness of that ton theory on that, without any further discussion?

A. It seems so to me.

Q. Now, in Exhibit 56, or Exhibit 26—I am calling your attention to Exhibit 26, you get the tons with the lap-overs included—ton miles I presume that is?

A. Yes, sir.

Q. —in the use of tons for this purpose, assuming the same yard engine expense for the haul of the state of 70 miles against the interstate of 218 miles: I wish you would state the effect of that.

This is the "yard engine" expense and they have used in Exhibit 56, the tons, and these tons, as I understand it have these horrible "lap-overs" in it: I want to know the effect of that upon this particular item of "yard engine" expense, when you consider that the state haul is 70 miles and the interstate is 218 miles.

A. Exhibit 56, in distributing the "Maintenance of Equipment" expense—that is, the proportion applicable to the "yard locomotive mileage" to yard engines, and in distributing the terminal
